CATEGORIAE
AND
DE INTERPRETATIONE

BY

E. M. EDGHILL, M.A.

EX-ASSOCIATE OF NEWNEAM COLLEGE, CAMBRIDGE

P R E F A C E

THIS translation has been made from Bekker's text of 1831, any departure from which has been indicated in the notes.

My chief authority in matters of interpretation has been Pacius ; I have also consulted Waitz's commentary largely.

My very grateful acknowledgments are due to the valuable criticisms and suggestions of Mr. W. D. Ross of Oriel College and Prof. J. A. Smith of Magdalen College.

E. M. E.

C A T E G O R I A E

TABLE OF CONTENTS

Ch. 1. Homonyms, synonyms, and derivatives.

Ch. 2. (1) Simple and composite expressions.

- (2) Things (a) predicable of a subject, (b) present in a subject, (c) both predicable of, and present in, a subject, (d) neither predicable of, nor present in, a subject.

Ch. 3. (1) That which is predicable of the predicate is predicable of the subject.

- (2) The differentiae of species in one genus are not the same as those in another, unless one genus is included in the other.

Ch. 4. The eight categories of the objects of thought.

Ch. 5. Substance.

- (1) Primary and secondary substance.
- (2) Difference in the relation subsisting between essential and accidental attributes and their subject.
- (3) All that which is not primary substance is either an essential or an accidental attribute of primary substance.
- (4) Of secondary substances, species are more truly substance than genera.
- (5) All species, which are not genera, are substance in the same degree, and all primary substances are substance in the same degree.
- (6) Nothing except species and genera is secondary substance.
- (7) The relation of primary substance to secondary substance and to all other predicates is the same as that of secondary substance to all other predicates.
- (8) Substance is never an accidental attribute.
- (9) The differentiae of species are not accidental attributes.
- (10) Species, genus, and differentiae, as predicates, are 'univocal' with their subject.
- (11) Primary substance is individual; secondary substance is the qualification of that which is individual.
- (12) No substance has a contrary.
- (13) No substance can be what it is in varying degrees.

CATEGORIAE

- (14) The particular mark of substance is that contrary qualities can be predicated of it.
- (15) Contrary qualities cannot be predicated of anything other than substances, not even of propositions and judgements.

Ch. 6. Quantity: (1) Discrete and continuous quantity.

- (2) Division of quantities, i.e. number, the spoken word, the line, the surface, the solid, time, place, into these two classes.
- (3) The parts of some quantities have a relative position, those of others have not. Division of quantities into these two classes.
- (4) Quantitative terms are applied to things other than quantity, in view of their relation to one of the aforesaid quantities.
- (5) Quantities have no contraries.
- (6) Terms such as 'great' and 'small' are relative, not quantitative, and moreover cannot be contrary to each other.
- (7) That which is most reasonably supposed to contain a contrary is space.
- (8) No quantity can be what it is in varying degrees.
- (9) The peculiar mark of quantity is that equality and inequality can be predicated of it.

Ch. 7. Relation.

- (1) First definition of relatives.
- (2) Some relatives have contraries.
- (3) Some relatives are what they are in varying degrees.
- (4) A relative term has always its correlative, and the two are interdependent.
- (5) The correlative is only clear when the relative is given its proper name, and in some cases words must be coined for this purpose.
- (6) Most relatives come into existence simultaneously; but the objects of knowledge and perception are prior to knowledge and perception.
- (7) No primary substance or part of a primary substance is relative.
- (8) Revised definition of relatives, excluding secondary substances.
- (9) It is impossible to know that a thing is relative, unless we know that to which it is relative.

Ch. 8. Quality.

- (1) Definition of qualities.
- (2) Different kinds of quality:
 - (a) habits and dispositions;
 - (b) capacities;
 - (c) affective qualities. [Distinction between affective qualities and affections.]
 - (d) shape, &c. [Rarity, density, &c., are not qualities.]

TABLE OF CONTENTS

- (3) Adjectives are generally formed derivatively from the names of the corresponding qualities.
- (4) Most qualities have contraries.
- (5) If of two contraries one is a quality, the other is also a quality.
- (6) A quality can in most cases be what it is in varying degrees, and subjects can possess most qualities in varying degrees. Qualities of shape are an exception to this rule.
- (7) The peculiar mark of quality is that likeness and unlikeness is predicable of things in respect of it.
- (8) Habits and dispositions as genera are relative; as individual, qualitative.

Ch. 9. Action and affection and the other categories described.

Ch. 10. Four classes of 'opposites'.

(a) Correlatives.

(b) Contraries. [Some contraries have an intermediate, and some have not.]

(c) Positives and privatives.

The terms expressing possession and privation are not the positive and privative, though the former are opposed each to each in the same sense as the latter.

Similarly the facts which form the basis of an affirmation or a denial are opposed each to each in the same sense as the affirmation and denial themselves.

Positives and privatives are not opposed in the sense in which correlatives are opposed.

Positives and privatives are not opposed in the same sense in which contraries are opposed.

For (i) they are not of the class which has no intermediate, nor of the class which has intermediates.

(ii) There can be no change from one state (privation) to its opposite.

(d) Affirmation and negation. These are distinguished from other contraries by the fact that one is always false and the other true. [Opposite affirmations seem to possess this mark, but they do not.]

Ch. 11. Contraries further discussed.

Evil is generally the contrary of good, but sometimes two evils are contrary.

When one contrary exists, the other need not exist.

Contrary attributes are applicable within the same species or genus.

Contraries must themselves be within the same genus, or within opposite genera, or be themselves genera.

CATEGORIAE

Ch. 12. The word 'prior' is applicable :

- (a) to that which is previous in time ;
- (b) to that on which something else depends, but which is not itself dependent on it ;
- (c) to that which is prior in arrangement ;
- (d) to that which is better or more honourable ;
- (e) to that one of two interdependent things which is the cause of the other.

Ch. 13. The word 'simultaneous' is used :

- (a) of those things which come into being at the same time ;
- (b) of those things which are interdependent, but neither of which is the cause of the other.
- (c) of the different species of the same genus.

Ch. 14. Motion is of six kinds.

Alteration is distinct from other kinds of motion.

Definition of the contrary of motion and of the various kinds of motion.

Ch. 15. The meanings of the term 'to have'.

C A T E G O R I A E

1 THINGS are said to be named 'equivocally' when, 1^a though they have a common name, the definition corresponding with the name differs for each. Thus, a real man and a figure in a picture can both lay claim to the name 'animal'; yet these are equivocally so named, for, though they have a common name, the definition corresponding with the name differs for each. For should any one define in what sense each is an animal, his definition in the one 5 case will be appropriate to that case only.

On the other hand, things are said to be named 'univocally' which have both the name and the definition answering to the name in common. A man and an ox are both 'animal', and these are univocally so named, inasmuch as not only the name, but also the definition, is the same in both cases: for if a man should state in what sense each 10 is an animal, the statement in the one case would be identical with that in the other.

Things are said to be named 'derivatively', which derive their name from some other name, but differ from it in termination. Thus the grammarian derives his name from the word 'grammar', and the courageous man from 15 the word 'courage'.

2 Forms of speech are either simple or composite. Examples of the latter are such expressions as 'the man runs', 'the man wins'; of the former 'man', 'ox', 'runs', 'wins'.

Of things themselves some are predicable of a subject, 20 and are never present in a subject. Thus 'man' is predicable of the individual man, and is never present in a subject.

By being 'present in a subject' I do not mean present as parts are present in a whole, but being incapable of existence apart from the said subject.

Some things, again, are present in a subject, but are
 15 never predicable of a subject. For instance, a certain point
 of grammatical knowledge is present in the mind, but is not
 predicable of any subject; or again, a certain whiteness
 may be present in the body (for colour requires a material
 basis), yet it is never predicable of anything.

Other things, again, are both predicable of a subject and
 1^b present in a subject. Thus while knowledge is present in
 the human mind, it is predicable of grammar.

There is, lastly, a class of things which are neither
 present in a subject nor predicable of a subject, such as the
 5 individual man or the individual horse. But, to speak
 more generally, that which is individual and has the
 character of a unit is never predicable of a subject. Yet in
 some cases there is nothing to prevent such being present
 in a subject. Thus a certain point of grammatical know-
 ledge is present in a subject.¹

10 When one thing is predicated of another, all that which is 3
 predicable of the predicate will be predicable also of the
 subject. Thus, 'man' is predicated of the individual man;
 but 'animal' is predicated of 'man'; it will, therefore, be
 15 predicable of the individual man also: for the individual
 man is both 'man' and 'animal'.

If genera are different² and co-ordinate, their differentiae
 are themselves different in kind. Take as an instance the
 genus 'animal' and the genus 'knowledge'. 'With feet',
 'two-footed', 'winged', 'aquatic', are differentiae of 'animal';
 the species of knowledge are not distinguished by the same
 differentiae. One species of knowledge does not differ from
 another in being 'two-footed'.

20 But where one genus is subordinate to another, there is
 nothing to prevent their having the same differentiae: for
 the greater class is predicated of the lesser, so that all the
 differentiae of the predicate will be differentiae also of the
 subject.

25 Expressions which are in no way composite signify 4

¹ Omit μέν in l. 9 with A, B, and Waitz, and καθ' ὑποκειμένου . . .
 λέγεται with B and Waitz.

² Read τῶν ἐτέρων γενῶν in l. 16 with Dexippus, Phil., Simpl., Waitz.

substance, quantity, quality, relation, place, time, position, state, action, or affection. To sketch my meaning roughly, examples of substance are 'man' or 'the horse', of quantity, such terms as 'two cubits long' or 'three cubits long', of quality, such attributes as 'white', 'grammatical'. 'Double', 'half', 'greater', fall under the category of relation; 'in the market place', 'in the Lyceum', under 2^a that of place; 'yesterday', 'last year', under that of time. 'Lying', 'sitting', are terms indicating 'position'; 'shod', 'armed', state; 'to lance', 'to cauterize', action; 'to be lanced', 'to be cauterized', affection.

No one of these terms, in and by itself, involves an affirmation¹; it is by the combination of such terms that positive or negative statements arise. For every assertion must, as is admitted, be either true or false, whereas expressions which are not in any way composite, such as 'man', 'white', 'runs', 'wins', cannot be either true or 10 false.

- 5 Substance, in the truest and primary and most definite sense of the word, is that which is neither predicable of a subject nor present in a subject; for instance, the individual man or horse. But in a secondary sense those things are called substances within which, as species, the primary substances are included; also those which, as genera, include 15 the species. For instance, the individual man is included in the species 'man', and the genus to which the species belongs is 'animal'; these, therefore—that is to say, the species 'man' and the genus 'animal'—are termed secondary substances.

It is plain from what has been said that both the name and the definition of the predicate must be predicable of 20 the subject. For instance, 'man' is predicated of the individual man. Now in this case the name of the species 'man' is applied to the individual, for we use the term 'man' in describing the individual; and the definition of 'man' will also be predicated of the individual man, for the individual man is both man and animal. Thus, both the 25

¹ Omit ἡ ἀποφάνει in 1. 6 with Amm., Simpl., Waitz.

name and the definition of the species are predicable of the individual.

With regard, on the other hand, to those things which are present in a subject, it is generally the case that neither their name nor their definition is predicable of that in which they are present. Though, however, the definition is never
 30 predicable, there is nothing in certain cases to prevent the name being used. For instance, 'white' being present in a body is predicated of that in which it is present, for a body is called white: the definition, however, of the colour 'white' is never predicable of the body.¹

Everything except primary substances is either predicable of a primary substance or present in a primary substance.
 35 This becomes evident by reference to particular instances which occur. 'Animal' is predicated of the species 'man', therefore of the individual man, for if there were no individual man of whom it could be predicated, it could not
 2^b be predicated of the species 'man' at all. Again, colour is present in body, therefore in individual bodies, for if there were no individual body in which it was present, it could not be present in body at all. Thus everything except primary substances is either predicated of primary substances, or is present in them, and if these last did not exist, it would be impossible for anything else to exist.

Of secondary substances, the species is more truly substance than the genus, being more nearly related to primary substance. For if any one should render an account of what a primary substance is, he would render a more instructive account, and one more proper to the subject, by
 10 stating the species than by stating the genus. Thus, he would give a more instructive account of an individual man by stating that he was man than by stating that he was animal, for the former description is peculiar to the individual in

¹ Qualities pure and simple are abstractions, and in their abstract substantival form, with regard to which they are defined, do not form the predicate of substances. We do not say 'X is whiteness' but 'X is white'. It is to this latter use of the adjective that Aristotle refers when he says that 'the name is sometimes applicable', for in Greek 'whiteness' is not only λευκότης, but also το λευκον. In English 'evil' used in the one case as a noun, in the other as an adjective, would afford a parallel.

a greater degree, while the latter is too general. Again, the man who gives an account of the nature of an individual tree will give a more instructive account by mentioning the species 'tree' than by mentioning the genus 'plant'.

Moreover, primary substances are most properly called 15 substances in virtue of the fact that they are the entities which underlie everything else, and that everything else is either predicated of them or present in them. Now the same relation which subsists between primary substance and everything else subsists also between the species and the genus: for the species is to the genus as subject is to predicate, since the genus is predicated of the species, 20 whereas the species cannot be predicated of the genus. Thus we have a second ground for asserting that the species is more truly substance than the genus.

Of species themselves, except in the case of such as are genera, no one is more truly substance than another. We should not give a more appropriate account of the individual man by stating the species to which he belonged, than we 25 should of an individual horse by adopting the same method of definition. In the same way, of primary substances, no one is more truly substance than another; an individual man is not more truly substance than an individual ox.

It is, then, with good reason that of all that remains, when we exclude primary substances, we concede to species and genera alone the name 'secondary substance', for these 30 alone of all the predicates convey a knowledge of primary substance. For it is by stating the species or the genus that we appropriately define any individual man; and we shall make our definition more exact by stating the former than by stating the latter. All other things that we state, such as that he is white, that he runs, and so on, are 35 irrelevant to the definition. Thus it is just that these alone, apart from primary substances, should be called substances.

Further, primary substances are most properly so called, because they underlie and are the subjects of everything else. Now the same relation that subsists between primary 3^a substance and everything else subsists also between the species and the genus to which the primary substance belongs,

on the one hand, and every attribute which is not included within these, on the other. For these are the subjects of all such. If we call an individual man 'skilled in grammar', the predicate is applicable also to the species and to the
 5 genus to which he belongs. This law holds good in all cases.

It is a common characteristic of all substance that it is never present in a subject. For primary substance is neither present in a subject nor predicated of a subject; while, with regard to secondary substances, it is clear from the following arguments (apart from others) that they are not present in
 10 a subject. For 'man' is predicated of the individual man, but is not present in any subject: for manhood is not present in the individual man.¹ In the same way, 'animal' is also predicated of the individual man, but is not present in him.
 15 Again, when a thing is present in a subject, though the name may quite well be applied to that in which it is present, the definition cannot be applied. Yet of secondary substances, not only the name, but also the definition, applies to the subject: we should use both the definition of the species and
 20 that of the genus with reference to the individual man. Thus substance cannot be present in a subject.

Yet this is not peculiar to substance, for it is also the case that differentiae cannot be present in subjects. The characteristics 'terrestrial' and 'two-footed' are predicated of the species 'man', but not present in it. For they are not *in*
 25 man. Moreover, the definition of the differentia may be predicated of that of which the differentia itself is predicated. For instance, if the characteristic 'terrestrial' is predicated of the species 'man', the definition also of that characteristic may be used to form the predicate of the species 'man': for 'man' is terrestrial.

The fact that the parts of substances appear to be present in the whole, as in a subject, should not make us apprehensive
 30 lest we should have to admit that such parts are not substances: for in explaining the phrase 'being present in a subject', we stated² that we meant 'otherwise than as parts in a whole'.

¹ Cf. the definition of 'present in a subject', 1^a 24.

² 1^a 24.

It is the mark of substances and of differentiae that, in all propositions of which they form the predicate, they are predicated univocally. For all such propositions have for their subject either the individual or the species. It is true ³⁵ that, inasmuch as primary substance is not predicable of anything, it can never form the predicate of any proposition. But of secondary substances, the species is predicated of the individual, the genus both of the species and of the individual. Similarly the differentiae are predicated of the species and ^{3^b} of the individuals. Moreover, the definition of the species and that of the genus are applicable to the primary substance, and that of the genus to the species. For all that is predicated of the predicate will be predicated also of the subject. Similarly, the definition of the differentiae will be ⁵ applicable to the species and to the individuals. But it was stated above ¹ that the word 'univocal' was applied to those things which had both name and definition in common. It is, therefore, established that in every proposition, of which either substance or a differentia forms the predicate, these are predicated univocally.

All substance appears to signify that which is individual. ¹⁰ In the case of primary substance this is indisputably true, for the thing is a unit. In the case of secondary substances, when we speak, for instance, of 'man' or 'animal', our form of speech gives the impression that we are here also indicating that which is individual, but the impression is not strictly ¹⁵ true; for a secondary substance is not an individual, but a class with a certain qualification; for it is not one and single as a primary substance is; the words 'man', 'animal', are predicable of more than one subject.

Yet species and genus do not merely indicate quality, like the term 'white'; 'white' indicates quality and nothing further, but species and genus determine the quality with reference to a substance: they signify substance qualitatively ²⁰ differentiated. The determinate qualification covers a larger field in the case of the genus than in that of the species: he who uses the word 'animal' is herein using a word of wider extension than he who uses the word 'man'.

Another mark of substance is that it has no contrary.

- ²⁵ What could be the contrary of any primary substance, such as the individual man or animal? It has none. Nor can the species or the genus have a contrary. Yet this characteristic is not peculiar to substance, but is true of many other things, such as quantity. There is nothing that forms the contrary of 'two cubits long' or of 'three cubits long',
³⁰ or of 'ten', or of any such term. A man may contend that 'much' is the contrary of 'little', or 'great' of 'small', but of definite quantitative terms no contrary exists.

Substance, again, does not appear to admit of variation of degree. I do not mean by this that one substance cannot be more or less truly substance than another, for it has
³⁵ already been stated¹ that this is the case; but that no single substance admits of varying degrees within itself. For instance, one particular substance,² 'man', cannot be more or less man either than himself at some other time or than some other man. One man cannot be more man than another, as that which is white may be more or less white
⁴ than some other white object, or as that which is beautiful may be more or less beautiful than some other beautiful object. The same quality, moreover, is said to subsist in a thing in varying degrees at different times. A body, being white, is said to be whiter at one time than it was before, or, being warm, is said to be warmer or less warm than at
⁵ some other time. But substance is not said to be more or less that which it is: a man is not more truly a man at one time than he was before, nor is anything, if it is substance, more or less what it is. Substance, then, does not admit of variation of degree.

- ¹⁰ The most distinctive mark of substance appears to be that, while remaining numerically one and the same, it is capable of admitting contrary qualities. From among things other than substance, we should find ourselves unable to bring forward any which possessed this mark. Thus, one
¹⁵ and the same colour cannot be white and black. Nor can the same one action be good and bad: this law holds good with everything that is not substance. But one and the self-

¹ 2^a 11-^b 22.

² L 37 read *εἶδος* with A, B, C, Waitz.

same substance, while retaining its identity, is yet capable of admitting contrary qualities. The same individual person is at one time white, at another black, at one time warm, ²⁰ at another cold, at one time good, at another bad. This capacity is found nowhere else, though it might be maintained that a statement or opinion was an exception to the rule.¹ The same statement, it is agreed, can be both true and false. For if the statement 'he is sitting' is true, yet, when the ²⁵ person in question has risen, the same statement will be false. The same applies to opinions. For if any one thinks truly that a person is sitting, yet, when that person has risen, this same opinion, if still held, will be false. Yet although this exception may be allowed, there is, nevertheless, a difference in the manner in which the thing takes place. It is by themselves changing that substances admit contrary ³⁰ qualities. It is thus that that which was hot becomes cold, for it has entered into a different state. Similarly that which was white becomes black, and that which was bad good, by a process of change; and in the same way in all other cases it is by changing that substances are capable of admitting contrary qualities. But statements and opinions themselves remain unaltered in all respects: it is by the alteration in ³⁵ the facts of the case that the contrary quality comes to be theirs. The statement 'he is sitting' remains unaltered, but it is at one time true, at another false, according to ^{4^b} circumstances. What has been said of statements applies also to opinions. Thus, in respect of the manner in which the thing takes place, it is the peculiar mark of substance that it should be capable of admitting contrary qualities; for it is by itself changing that it does so.

If, then,² a man should make this exception and contend that statements and opinions are capable of admitting contrary qualities, his contention is unsound. For state- ⁵ ments and opinions are said to have this capacity, not because they themselves undergo modification, but because this modification occurs in the case of something else. The truth or falsity of a statement depends on facts, and

¹ Read τῶν τοιούτων in l. 23 with A, B, Phil., Waitz.

² Read ὅτι in l. 4 with A, B, C, Waitz.

There is no common boundary at which the syllables join, 32
but each is separate and distinct from the rest.

A line, on the other hand, is a continuous quantity, for it 3^a
is possible to find a common boundary at which its parts
join. In the case of the line, this common boundary is
the point; in the case of the plane, it is the line: for the
parts of the plane have also a common boundary. Similarly
you can find a common boundary in the case of the parts of
a solid, namely either a line or a plane. 5

Space and time also belong to this class of quantities.
Time, past, present, and future, forms a continuous whole.
Space, likewise, is a continuous quantity for the parts of a
solid occupy a certain space and these have a common
boundary; it follows that the parts of space also, which are 10
occupied by the parts of the solid have the same common
boundary as the parts of the solid. Thus, not only time,
but space also, is a continuous quantity for its parts have a
common boundary.

Quantities consist either of parts which bear a relative 15
position each to each, or of parts which do not. The parts
of a line bear a relative position to each other, for each lies
somewhere, and it would be possible to distinguish each,
and to state the position of each on the plane and to
explain to what sort of part among the rest each was
contiguous. Similarly the parts of a plane have position, 20
for it could similarly be stated what was the position of each
and what sort of parts were contiguous. The same is true
with regard to the solid and to space. But it would be
impossible to show that the parts of a number had a relative
position each to each, or a particular position, or to state 25
what parts were contiguous. Nor could this be done in the
case of time, for none of the parts of time has an abiding
existence, and that which does not abide can hardly have
position. It would be better to say that such parts had a
relative order, in virtue of one being prior to another.
Similarly with number: in counting, 'one' is prior to 'two', 30
and 'two' to 'three,' and thus the parts of number may be
said to possess a relative order, though it would be impos-
sible to discover any distinct position for each. This holds

good also in the case of speech. None of its parts has an abiding existence: when once a syllable is pronounced, it is
 35 not possible to retain it, so that, naturally, as the parts do not abide, they cannot have position. Thus, some quantities consist of parts which have position, and some of those which have not.

Strictly speaking, only the things which I have mentioned belong to the category of quantity: everything else that is called quantitative is a quantity in a secondary sense. It is because we have in mind some one of these quantities, properly so called, that we apply quantitative terms to
 5^b other things. We speak of what is white as large, because the surface over which the white extends is large; we speak of an action or a process as lengthy, because the time covered is long; these things cannot in their own right claim the quantitative epithet. For instance, should any one
 5 explain how long an action was, his statement would be made in terms of the time taken, to the effect that it lasted a year, or something of that sort. In the same way, he would explain the size of a white object in terms of surface, for he would state the area which it covered. Thus the things already mentioned, and these alone, are in their intrinsic nature quantities; nothing else can claim the name
 10 in its own right, but, if at all, only in a secondary sense.

Quantities have no contraries. In the case of definite quantities this is obvious; thus, there is nothing that is the contrary of 'two cubits long' or of 'three cubits long', or of a surface, or of any such quantities. A man might, indeed, argue that 'much' was the contrary of 'little', and 'great'
 15 of 'small'. But these are not quantitative, but relative; things are not great or small absolutely, they are so called rather as the result of an act of comparison. For instance, a mountain is called small, a grain large, in virtue of the fact that the latter is greater than others of its kind, the
 20 former less. Thus there is a reference here to an external standard, for if the terms 'great' and 'small' were used absolutely, a mountain would never be called small or a grain large. Again, we say that there are many people in a village, and few in Athens, although those in the city are

many times as numerous as those in the village: or we say that a house has many in it, and a theatre few, though those 25 in the theatre far outnumber those in the house. The terms 'two cubits long,' 'three cubits long,' and so on indicate quantity, the terms 'great' and 'small' indicate relation, for they have reference to an external standard. It is, therefore, plain that these are to be classed as relative.

Again, whether we define them as quantitative or not, 30 they have no contraries: for how can there be a contrary of an attribute which is not to be apprehended in or by itself, but only by reference to something external? Again, if 'great' and 'small' are contraries, it will come about that the same subject can admit contrary qualities at one and the same time, and that things will themselves be contrary to themselves. For it happens at times that the 35 same thing is both small and great. For the same thing may be small in comparison with one thing, and great in comparison with another, so that the same thing comes to be both small and great at one and the same time, and is of such a nature as to admit contrary qualities at one and the same moment. Yet it was agreed, when substance was being discussed, that nothing admits contrary qualities at one and the same moment. For though substance is 6^a capable of admitting contrary qualities, yet no one is at the same time both sick and healthy, nothing is at the same time both white and black. Nor is there anything which is qualified in contrary ways at one and the same time.

Moreover, if these were contraries, they would themselves be contrary to themselves.¹ For if 'great' is the contrary 5

¹ The Greek words do not mean that the subject which possesses the two characteristics 'great' and 'small' will be the contrary of itself, but that 'great' and 'small' will be the contrary of themselves. The argument may be represented as follows:

Let x = 'small', y 'great'.

A is both x and y .

Now x and y are, *ex hypothesi*, attributes belonging to the same class (cf. 6^a 17 ἐν τῷ αὐτῷ γένει: also 14^a 19-25).

∴ if they both apply to the same subject, the relation between them may be represented by the formula $x = y$.

∴ if x is the contrary of y

x is the contrary of x

which is absurd.

∴ x is not the contrary of y .

of 'small', and the same thing is both great and small at the same time, then 'small' or 'great' is the contrary of itself. But this is impossible. The term 'great', therefore, is not the contrary of the term 'small', nor 'much' of 'little'.

And even though a man should call these terms not relative,
 10 but quantitative, they would not have contraries.

It is in the case of space that quantity most plausibly appears to admit of a contrary. For men define the term 'above' as the contrary of 'below', when it is the region at the centre they mean by 'below'; and this is so, because nothing is farther from the extremities of the universe than
 15 the region at the centre.¹ Indeed, it seems that in defining contraries of every kind men have recourse to a spatial metaphor, for they say that those things are contraries which, within the same class, are separated *by the greatest possible distance*.

Quantity does not, it appears, admit of variation of degree.
 20 One thing cannot be two cubits long in a greater degree than another. Similarly with regard to number: what is 'three' is not more truly three than what is 'five' is five; nor is one set of three more truly three than another set.² Again, one period of time is not said to be more truly time than another. Nor is there any other kind of quantity, of all that have been mentioned, with regard to which varia-
 25 tion of degree can be predicated. The category of quantity, therefore, does not admit of variation of degree.

The most distinctive mark of quantity is that equality and inequality are predicated of it. Each of the aforesaid quantities is said to be equal or unequal. For instance, one solid is said to be equal or unequal to another; number, too,

¹ No point is farther from the circumference of a circle *taken as a whole* than the centre. Cf. *de Caelo*, 268^b 21.

² 6^a 22. The reading of B and Waitz is here adopted: τὰ τρία τῶν πέντε οὐδὲν μᾶλλον πέντε ἢ τρία, οὐδὲ τὰ τρία τῶν τριῶν. That of Bekker yields no satisfactory sense. By comparison with the method adopted by Aristotle in treating of variation of degree with regard to other categories, it may be surmised that the meaning here is that given in the translation. The difficulty of the passage is not much lessened by substituting τρία ἢ πέντε for πέντε ἢ τρία, as either reading is a very clumsy expression of the sense: τὰ τρία οὐδὲν μᾶλλον τρία ἢ τὰ πέντε πέντε. In the translation, πέντε ἢ τρία is taken as equivalent in sense to ὅπερ ἐστίν.

and time can have these terms applied to them,¹ as indeed can all those kinds of quantity that have been mentioned. 30

That which is not a quantity can by no means, it would seem, be termed equal or unequal to anything else. One particular disposition or one particular quality, such as whiteness, is by no means compared with another in terms of equality and inequality but rather in terms of similarity. Thus it is the distinctive mark of quantity that it can be called equal and unequal. 35

- 7 Those things are called relative, which, being either said to be *of* something else or *related to* something else, are explained by reference to that other thing.² For instance, the word 'superior' is explained by reference to something else, for it is superiority *over something else* that is meant. Similarly, the expression 'double' has this external reference, for it is the double *of something else* that is meant. So it is with everything else of this kind. There are, 6^b moreover, other relatives, e. g. habit, disposition, perception, knowledge, and attitude.³ The significance of all these is explained by a reference to something else and in no other way. Thus, a habit is a habit *of something*, knowledge is knowledge *of something*, attitude is the attitude *of something*. So it is with all other relatives that have been mentioned. Those terms, then, are called relative, the nature of which is explained by reference to something else, the preposition 'of' or some other preposition being used to indicate the relation. Thus, one mountain is called great *in comparison with another*; for the mountain claims this attribute *by comparison with* something. Again, that which is called

¹ Read in l. 29, before καὶ χρόνος, καὶ ἀριθμὸς καὶ ἴσος καὶ ἄνισος λέγεται, with A, B, C, and Waitz.

² Aristotle reckons as relative (1) terms which in Greek have a genitive depending on them (ὅσα ἐτέρων εἶναι λέγεται) and (2) terms which naturally call for a prepositional phrase depending on them (ἢ ὁπωσοῦν ἄλλως πρὸς ἕτερον). Since there is no one form in English answering to the Greek use of the genitive, the distinction has been somewhat paraphrased in the translation: but it must not be forgotten that the distinction is taken primarily from the usage of the Greek language.

³ Just as the genus 'knowledge' is relative, while the particular branches of it are not (see 11^a 20), so 'habit' and 'attitude' require particularization; otherwise they are relative.

10 similar must be similar *to something else*, and all other such attributes have this external reference. It is to be noted that lying and standing and sitting are particular attitudes, but attitude is itself a relative term. To lie, to stand, to be seated, are not themselves attitudes, but take their name from the aforesaid attitudes.

15 It is possible for relatives to have contraries. Thus virtue has a contrary, vice, these both being relatives; knowledge, too, has a contrary, ignorance. But this is not the mark of all relatives; 'double' and 'triple' have no contrary, nor indeed has any such term.

20 It also appears that relatives can admit of variation of degree. For 'like' and 'unlike', 'equal' and 'unequal', have the modifications 'more' and 'less' applied to them, and each of these is relative in character: for the terms 'like' and 'unequal'¹ bear a reference to something external. Yet, again, it is not every relative term that admits of variation
25 of degree. No term such as 'double' admits of this modification. All relatives have correlatives: by the term 'slave' we mean the slave *of a master*; by the term 'master', the
30 master *of a slave*; by 'double', the double *of its half*; by 'half', the half *of its double*; by 'greater', greater *than that which is less*; by 'less', less *than that which is greater*.

So it is with every other relative term; but the case we use to express the correlation differs in some instances. Thus, by knowledge we mean knowledge *of the knowable*; by the knowable, that which is to be apprehended *by know-*
35 ledge; by perception, perception *of the perceptible*; by the perceptible, that which is apprehended *by perception*.

Sometimes, however, reciprocity of correlation does not appear to exist. This comes about when a blunder is made, and that to which the relative is related is not accurately stated. If a man states that a wing is necessarily relative to a bird, the connexion between these two will not be reciprocal, for it will not be possible to say that a bird is a bird by reason of its wings. The reason is that the original

¹ 6^b 23. The reading of B and Waitz: τό τε γὰρ ὅμοιον τινὶ ὅμοιον λέγεται, καὶ τὸ ἀνίσσον τινὶ ἀνίσσον. This has more inherent probability than, and equal authority with, that of Bekker.

statement was inaccurate, for the wing is not said to be 7^a relative to the bird *qua* bird, since many creatures besides birds have wings, but *qua* winged creature. If, then, the statement is made accurate, the connexion will be reciprocal, for we can speak of a wing having reference necessarily to a winged creature, and of a winged creature as being such because of its wings.

Occasionally, perhaps, it is necessary to coin words, if no 5 word exists by which a correlation can adequately be explained. If we define a rudder as necessarily having reference to a boat, our definition will not be appropriate, for the rudder does not have this reference to a boat *qua* boat, as there are boats which have no rudders. Thus we 10 cannot use the terms reciprocally, for the word 'boat' cannot be said to find its explanation in the word 'rudder'. As there is no existing word, our definition would perhaps be more accurate if we coined some word like 'ruddered' as the correlative of 'rudder'. If we express ourselves thus accurately, at any rate the terms are reciprocally connected, for the 'ruddered' thing is 'ruddered' in virtue of its rudder. So it is in all other cases. A head will be 15 more accurately defined as the correlative of that which is 'headed', than as that of an animal, for the animal does not have a head *qua* animal, since many animals have no head.

Thus we may perhaps most easily comprehend that to which a thing is related, when a name does not exist, if, from that which has a name, we derive a new name, and apply it to that with which the first is reciprocally connected, as in the aforesaid instances, when we derived the word 20 'winged' from 'wing' and 'ruddered' from 'rudder'.

All relatives, then, if properly defined, have a correlative. I add this condition because, if that to which they are related is stated at haphazard and not accurately, the two are not found to be interdependent. Let me state what I mean 25 more clearly. Even in the case of acknowledged correlatives, and where names exist for each, there will be no interdependence if one of the two is denoted, not by that name which expresses the correlative notion, but by one of irrelevant significance. The term 'slave', if defined as

related, not to a master, but to a man, or a biped, or anything of that sort, is not reciprocally connected with that in
 30 relation to which it is defined, for the statement is not exact.

Further, if one thing is said to be correlative with another, and the terminology used is correct, then, though all irrelevant attributes should be removed, and only that one attribute left in virtue of which it was correctly stated to be correlative with that other, the stated correlation will still exist. If the correlative of 'the slave' is said to be 'the master',
 35 then, though all irrelevant attributes of the said 'master', such as 'biped', 'receptive of knowledge', 'human', should be removed, and the attribute 'master' alone left, the stated correlation existing between him and the slave will remain the same, for it is *of a master* that a slave is said to be the slave.

7^b On the other hand, if, of two correlatives, one is not correctly termed, then, when all other attributes are removed and that alone is left in virtue of which it was stated to be correlative, the stated correlation will be found to have disappeared.

For suppose the correlative of 'the slave' should be said to be 'the man', or the correlative of 'the wing' 'the bird';
 5 if the attribute 'master' be withdrawn from 'the man', the correlation between 'the man' and 'the slave' will cease to exist, for if the man is not a master, the slave is not a slave. Similarly, if the attribute 'winged' be withdrawn from 'the bird', 'the wing' will no longer be relative; for if the so-called correlative is not winged, it follows that 'the wing' has no correlative.

10 Thus it is essential that the correlated terms should be exactly designated; if there is a name existing, the statement will be easy; if not, it is doubtless our duty to construct names. When the terminology is thus correct, it is evident that all correlatives are interdependent.

15 Correlatives are thought to come into existence simultaneously. This is for the most part true, as in the case of the double and the half. The existence of the half necessitates the existence of that of which it is a half. Similarly the existence of a master necessitates the existence of a slave, and that of a slave implies that of a master; these

are merely instances of a general rule. Moreover, they cancel one another; for if there is no double it follows that 10 there is no half, and vice versa; this rule also applies to all such correlatives. Yet it does not appear to be true in all cases that correlatives come into existence simultaneously. The object of knowledge would appear to exist before knowledge itself, for it is usually the case that we acquire knowledge of objects already existing; it would be difficult, 25 if not impossible, to find a branch of knowledge the beginning of the existence of which was contemporaneous with that of its object.

Again, while the object of knowledge, if it ceases to exist, cancels at the same time the knowledge which was its correlative, the converse of this is not true. It is true that if the object of knowledge does not exist there can be no knowledge: for there will no longer be anything to know. Yet it is equally true that, if the knowledge of a certain 30 object does not exist, the object may nevertheless quite well exist. Thus, in the case of the squaring of the circle, if indeed that process is an object of knowledge, though it itself exists as an object of knowledge, yet the knowledge of it has not yet come into existence. Again, if all animals ceased to exist, there would be no knowledge, but there might yet be many objects of knowledge.

This is likewise the case with regard to perception: for the 35 object of perception is, it appears, prior to the act of perception. If the perceptible is annihilated, perception also will cease to exist; but the annihilation of perception does not cancel the existence of the perceptible. For perception implies a body perceived and a body in which perception takes place. Now if that which is perceptible is annihilated, it follows that the body is annihilated, for the body is a perceptible thing; and if the body does not exist, it follows that 8^a perception also ceases to exist. Thus the annihilation of the perceptible involves that of perception.

But the annihilation of perception does not involve that of the perceptible. For if the animal is annihilated, it follows that perception also is annihilated, but perceptibles 5 such as body, heat, sweetness, bitterness, and so on, will remain.

Again, perception is generated at the same time as the perceiving subject, for it comes into existence at the same time as the animal. But the perceptible surely exists before¹ perception; for fire and water and such elements, 10 out of which the animal is itself composed, exist before the animal is an animal at all, and before perception. Thus it would seem that the perceptible exists before perception.

It may be questioned whether it is true that no substance is relative, as seems to be the case, or whether exception is to be made in the case of certain secondary substances.² 15 With regard to primary substances, it is quite true that there is no such possibility, for neither wholes nor parts of primary substances are relative. The individual man or ox is not defined with reference to something external. Similarly 20 with the parts: a particular hand or head is not defined as a particular hand or head of a particular person, but as the hand or head of a particular person. It is true also, for the most part at least, in the case of secondary substances; the species 'man' and the species 'ox' are not defined with reference to anything outside themselves. Wood, again, is only relative in so far as it is some one's property, not in so far as it is wood. It is plain, then, that in the cases men- 25 tioned substance is not relative. But with regard to some secondary substances there is a difference of opinion; thus, such terms as 'head' and 'hand'³ are defined with reference to that of which the things indicated are a part, and so it comes about that these appear to have a relative character.⁴ Indeed, if our definition of that which is relative was 30 complete, it is very difficult, if not impossible, to prove that no substance is relative. If, however, our definition was not complete, if those things only are properly called relative in the case of which relation to an external object is a necessary condition of existence, perhaps some explanation of the dilemma may be found.

¹ Omit *ἔμπροσθεν* in l. 9 with B, Phil., and Waitz.

² So far Aristotle has stated, and adhered to, the generally received definition of relatives; he now improves upon it.

³ *Sc.*: when the species are meant.

⁴ In accordance with this, Aristotle speaks of 'wing' as a relative term in the earlier part of the chapter.

The former definition does indeed apply to all relatives, but the fact that a thing is explained with reference to something else does not make it essentially relative.¹

From this it is plain that, if a man definitely apprehends 35 a relative thing, he will also definitely apprehend that to which it is relative. Indeed this is self-evident: for if a man knows that some particular thing is relative, assuming that we call that a relative in the case of which relation to something is a necessary condition of existence, he knows 8^b that also to which it is related. For if he does not know at all that to which it is related, he will not know whether or not it is relative. This is clear, moreover, in particular instances. If a man knows definitely that such and such a thing is 'double', he will also forthwith know definitely 5 that of which it is the double. For if there is nothing definite of which he knows it to be the double, he does not know at all that it is double. Again, if he knows that *a thing is more beautiful, it follows necessarily that he will* forthwith definitely know that also than which it is more beautiful. He will not merely know indefinitely that it is more beautiful than something which is less beautiful, for 10 this would be supposition, not knowledge. For if he does not know definitely that than which it is more beautiful, he can no longer claim to know definitely that it is more beautiful than something else which is less beautiful: for it might be that nothing was less beautiful. It is, therefore, evident that if a man apprehends some relative thing definitely, he necessarily knows that also definitely to which it is related.

Now the head, the hand, and such things are substances, 15 and it is possible to know their essential character definitely, but it does not necessarily follow that we should know that to which they are related. It is not possible to know forthwith whose head or hand is meant. Thus these are not relatives, and, this being the case, it would be true to 20 say that no substance is relative in character. It is perhaps a difficult matter, in such cases, to make a positive statement

¹ οὐ μὴν τοῦτά (A₂, C, Phil., and Waitz) γέ ἐστι τὸ (A₂, B, C, Phil., and Waitz) πρὸς τι, in l. 34.

without more exhaustive examination, but to have raised questions with regard to details is not without advantage.

- 25 By 'quality' I mean that in virtue of which people are said 8
to be such and such.

Quality is a term that is used in many senses. One sort of quality let us call 'habit' or 'disposition'.¹ Habit differs from disposition in being more lasting and more firmly established. The various kinds of knowledge and of virtue are habits, for knowledge, even when acquired only in
30 a moderate degree, is, it is agreed, abiding in its character and difficult to displace, unless some great mental upheaval takes place, through disease or any such cause. The virtues, also, such as justice, self-restraint, and so on, are not easily dislodged or dismissed, so as to give place to vice.

- 35 By a disposition, on the other hand, we mean a condition that is easily changed and quickly gives place to its opposite. Thus, heat, cold, disease, health, and so on are dispositions. For a man is disposed in one way or another with reference to these, but quickly changes, becoming
9^a cold instead of warm, ill instead of well. So it is with all other dispositions also, unless through lapse of time a disposition has itself become inveterate and almost impossible to dislodge: in which case we should perhaps go so far as to call it a habit.

It is evident that men incline to call those conditions habits which are of a more or less permanent type and
5 difficult to displace; for those who are not retentive of knowledge, but volatile, are not said to have such and such a 'habit' as regards knowledge, yet they are *disposed*, we may say, either better or worse, towards knowledge. Thus habit differs from disposition in this, that while the latter is ephemeral, the former is permanent and difficult to alter.

- 10 Habits are at the same time dispositions, but dispositions are not necessarily habits. For those who have some

¹ The term 'habit' itself is relative, but particular habits are qualities; as also virtues and vices. ἔξω means 'habit' and 'state'; sometimes the one, sometimes the other, English word gives the sense better; but it is, perhaps, best to reserve the word 'state' for the category so called.

specific habit may be said also, in virtue of that habit, to be thus or thus disposed ; but those who are disposed in some specific way have not in all cases the corresponding habit.

Another sort of quality is that in virtue of which, for example, we call men good boxers or runners, or healthy or sickly : in fact it includes all those terms which refer to 15 inborn capacity or incapacity. Such things are not predicated of a person in virtue of his disposition, but in virtue of his inborn capacity or incapacity to do something with ease or to avoid defeat of any kind. Persons are called good boxers or good runners, not in virtue of such and such a disposition, but in virtue of an inborn capacity to 20 accomplish something with ease. Men are called healthy in virtue of the inborn capacity of easy resistance to those unhealthy influences that may ordinarily arise ; unhealthy, in virtue of the lack of this capacity. Similarly with regard to softness and hardness. Hardness is predicated of a 25 thing because it has that capacity of resistance which enables it to withstand disintegration ; softness, again, is predicated of a thing by reason of the lack of that capacity.

A third class within this category is that of affective qualities and affections.¹ Sweetness, bitterness, sourness, are examples of this sort of quality, together with all that is akin to these ; heat, moreover, and cold, whiteness, and 30 blackness are affective qualities. It is evident that these are qualities, for those things that possess them are themselves said to be such and such by reason of their presence. Honey is called sweet because it contains sweetness ; the body is called white because it contains whiteness ; and so in all other cases.

The term 'affective quality' is not used as indicating 35 that those things which admit these qualities are affected in any way. Honey is not called sweet because it is affected 9^b in a specific way, nor is this what is meant in any other instance. Similarly heat and cold are called affective qualities, not because those things which admit them are affected. What is meant is that these said qualities are 5

¹ Here Aristotle seems to call *πάθη ποιότητες*, but later he distinguishes them.

capable of producing an 'affection' in the way of perception. For sweetness has the power of affecting the sense of taste; heat, that of touch; and so it is with the rest of these qualities.

Whiteness and blackness, however, and the other colours, are not said to be affective qualities in this sense, but because they themselves are the results of an affection.¹ It is plain that many changes of colour take place because of affections. When a man is ashamed, he blushes; when he is afraid, he becomes pale, and so on. So true is this, that when a man is by nature liable to such affections, arising from some concomitance of elements in his constitution, it is a probable inference that he has the corresponding complexion of skin. For the same disposition of bodily elements, which in the former instance was momentarily present in the case of an access of shame, might be a result of a man's natural temperament, so as to produce the corresponding colouring also as a natural characteristic. All conditions, therefore, of this kind, if caused by certain permanent and lasting affections, are called affective qualities. For pallor and duskiness of complexion are called qualities, inasmuch as we are said to be such and such in virtue of them, not only if they originate in natural constitution, but also if they come about through long disease or sunburn, and are difficult to remove, or indeed remain throughout life. For in the same way we are said to be such and such because of these.

Those conditions, however, which arise from causes which may easily be rendered ineffective or speedily removed, are called, not qualities, but affections: for we are not said to be such and such in virtue of them. The man who blushes through shame is not said to be a constitutional blusher, nor is the man who becomes pale through fear said to be constitutionally pale. He is said rather to have been affected. Thus such conditions are called affections, not qualities.

¹ The colours seen in inanimate objects are presumably to be called affective qualities in the former sense of the word, because they affect the eye.

In like manner there are affective qualities and affections of the soul. That temper with which a man is born and 35 which has its origin in certain deep-seated affections is called a quality. I mean such conditions as insanity. 10^a irascibility, and so on : for people are said to be mad or irascible in virtue of these. Similarly those abnormal psychic states which are not inborn, but arise from the concomitance of certain other elements, and are difficult to remove, or altogether permanent, are called qualities, for in 5 virtue of them men are said to be such and such.

Those, however, which arise from causes easily rendered ineffective are called affections, not qualities. Suppose that a man is irritable when vexed : he is not even spoken of as a bad-tempered man, when in such circumstances he loses his temper somewhat, but rather is said to be affected. Such conditions are therefore termed, not qualities, but affections. 10

The fourth sort of quality is figure and the shape that belongs to a thing ; and besides this, straightness and curvedness and any other qualities of this type ; each of these defines a thing as being such and such. Because it is triangular or quadrangular a thing is said to have a specific character, or again because it is straight or curved ;¹ in fact 15 a thing's shape in every case gives rise to a qualification of it.

Rarity and density, roughness and smoothness, seem to be terms indicating quality : yet these, it would appear, really belong to a class different from that of quality. For it is rather a certain relative position of the parts composing the thing thus qualified which, it appears, is indicated by each of these terms. A thing is dense, owing to the fact that its 20 parts are closely combined with one another ; rare, because there are interstices between the parts ; smooth, because its parts lie, so to speak, evenly ; rough, because some parts project beyond others.

There may be other sorts of quality, but those that are 25 most properly so called have, we may safely say, been enumerated.

¹ Read τῆ γὰρ πρίστανον . . . τῶ εὐθεῖ in ll. 14, 15 with Waitz.

These, then, are qualities, and the things that take their name from them as derivatives, or are in some other way dependent on them, are said to be qualified in some specific way.¹ In most, indeed in almost all cases, the name of that
 30 which is qualified is derived from that of the quality. Thus the terms 'whiteness', 'grammar', 'justice', give us the adjectives 'white', 'grammatical', 'just', and so on.

There are some cases, however, in which, as the quality under consideration has no name, it is impossible that those possessed of it should have a name that is derivative. For instance, the name given to the runner or boxer, who is so
 35 called in virtue of an inborn capacity, is not derived from 10^b that of any quality; for those capacities have no name assigned to them. In this, the inborn capacity is distinct from the science, with reference to which men are called, e.g., boxers or wrestlers. Such a science is classed as a disposition; it has a name, and is called 'boxing' or 'wrestling' as the case may be, and the name given to those disposed in this way is derived from that of the science.

5 Sometimes, even though a name exists for the quality, that which takes its character from the quality has a name that is not a derivative. For instance, the upright man takes his character from the possession of the quality of integrity, but the name given him is not derived from the word 'integrity'. Yet this does not occur often.

We may therefore state that those things are said to be
 10 possessed of some specific quality which have a name derived from that of the aforesaid quality, or which are in some other way dependent on it.

One quality may be the contrary of another; thus justice is the contrary of injustice, whiteness of blackness, and so on. The things, also, which are said to be such and such in virtue of these qualities, may be contrary the one to the other; for that which is unjust is contrary to that which is just,
 15 that which is white to that which is black. This, however, is not always the case. Red, yellow, and such colours, though qualities, have no contraries.

¹ The words τὸ ποιόν and τὰ ποιῶ are, however, often used in this chapter as equivalent to ποιότης: cf. 10^b 20 ποιὸν ἢ δικαιοσύνη.

If one of two contraries is a quality, the other will also be a quality. This will be evident from particular instances, if we apply the names used to denote the other categories; for instance, granted that justice is the contrary of injustice and justice is a quality, injustice will also be a quality: 20 neither quantity, nor relation, nor place, nor indeed any other category but that of quality, will be applicable properly to injustice. So it is with all other contraries falling under the category of quality. 25

Qualities admit of variation of degree. Whiteness is predicated of one thing in a greater or less degree than of another. This is also the case with reference to justice. Moreover, one and the same thing may exhibit a quality in a greater degree than it did before: if a thing is white, it may become whiter.

Though this is generally the case, there are exceptions. For if we should say that justice admitted of variation of 30 degree, difficulties might ensue, and this is true with regard to all those qualities which are dispositions. There are some, indeed, who dispute the possibility of variation here. They maintain that justice and health cannot very well admit of variation of degree themselves, but that people 35 vary in the degree in which they possess these qualities, and that this is the case with grammatical learning and all 11^a those qualities which are classed as dispositions. However that may be, it is an incontrovertible fact that the things which in virtue of these qualities are said to be what they are vary in the degree in which they possess them; for one man is said to be better versed in grammar, or more healthy or just, than another, and so on.

The qualities expressed by the terms 'triangular' and 5 'quadrangular' do not appear to admit of variation of degree, nor indeed do any that have to do with figure. For those things to which the definition of the triangle or circle is applicable are all equally triangular or circular. Those, on the other hand, to which the same definition is not applicable, cannot be said to differ from one another in degree; the square is no more a circle than the rectangle, for to 10 neither is the definition of the circle appropriate. In short,

if the definition of the term proposed is not applicable to both objects, they cannot be compared. Thus it is not all qualities which admit of variation of degree.

15 Whereas none of the characteristics I have mentioned are peculiar to quality, the fact that likeness and unlikeness can be predicated with reference to quality only, gives to that category its distinctive feature. One thing is like another only with reference to that in virtue of which it is such and such; thus this forms the peculiar mark of quality.

20 We must not be disturbed because it may be argued that, though proposing to discuss the category of quality, we have included in it many relative terms. We did say that habits and dispositions were relative. In practically all such cases the genus is relative, the individual not. Thus knowledge, as a genus, is explained by reference to some-
 25 thing else, for we mean a knowledge of *something*. But particular branches of knowledge are not thus explained. The knowledge of grammar is not relative to anything external, nor is the knowledge of music, but these, if relative at all, are relative only in virtue of their genera; thus
 30 grammar is said to be the *knowledge* of something, not the grammar of something; similarly music is the *knowledge* of something, not the music of something.

Thus individual branches of knowledge are not relative. And it is because we possess these individual branches of knowledge that we are said to be such and such. It is these that we actually possess: we are called experts because we possess knowledge in some particular branch. Those
 35 particular branches, therefore, of knowledge, in virtue of which we are sometimes said to be such and such, are themselves qualities, and are not relative. Further, if anything should happen to fall within both the category of quality and that of relation, there would be nothing extraordinary in classing it under both these heads.

11^b Action and affection both admit of contraries and also 9 of variation of degree. Heating is the contrary of cooling, being heated of being cooled, being glad of being vexed. Thus they admit of contraries. They also admit of varia-
 5 tion of degree: for it is possible to heat in a greater or less

degree; also to be heated in a greater or less degree. Thus action and affection also admit of variation of degree. So much, then, is stated with regard to these categories.

We spoke, moreover, of the category of position when we were dealing with that of relation, and stated that such terms derived their names from those of the corresponding attitudes.

As for the rest, time, place, state, since they are easily intelligible, I say no more about them than was said at the beginning, that in the category of state are included such states as 'shod', 'armed', in that of place 'in the Lyceum' and so on, as was explained before.

10 The proposed categories have, then, been adequately dealt with. 15

We must next explain the various senses in which the term 'opposite' is used. Things are said to be opposed in four senses: (i) as correlatives to one another, (ii) as contraries to one another, (iii) as privatives to positives, (iv) as affirmatives to negatives.

Let me sketch my meaning in outline. An instance of the use of the word 'opposite' with reference to correlatives is afforded by the expressions 'double' and 'half'; with reference to contraries by 'bad' and 'good'. Opposites in the sense of 'privatives' and 'positives' are 'blindness' and 'sight'; in the sense of affirmatives and negatives, the propositions 'he sits', 'he does not sit'.

(1) Pairs of opposites which fall under the category of relation are explained by a reference of the one to the other, the reference being indicated by the preposition 'of' or by some other preposition. Thus, double is a relative term, for that which is double is explained as the double of *something*. Knowledge, again, is the opposite of the thing known, in the same sense; and the thing known also is explained by its relation to its opposite, knowledge. For the thing known is explained as that which is known *by something*; that is, by knowledge. Such things, then, as are opposite the one to the other in the sense of being correlatives are explained by a reference of the one to the other. 30

- (ii) Pairs of opposites which are contraries are not in any way interdependent, but are contrary the one to the other. The good is not spoken of as the good *of the bad*, but as *the contrary of the bad*, nor is white spoken of as the white *of the black*, but as *the contrary of the black*. These two types of opposition are therefore distinct. Those contraries which are such that the subjects in which they are naturally present, or of which they are predicated, must necessarily contain either the one or the other of them, have no intermediate, but those in the case of which no such necessity obtains, always have an intermediate. Thus disease and health are naturally present in the body of an animal, and it is necessary that either the one or the other should be present in the body of an animal. Odd and even, again, are predicated of number and it is necessary that the one or the other should be present in numbers. Now there is no intermediate between the terms of either of these two pairs. On the other hand in those contraries with regard to which no such necessity obtains, we find an intermediate. Blackness and whiteness are naturally present in the body, but it is not necessary that either the one or the other should be present in the body, inasmuch as it is not true to say that everybody must be white or black. Badness and goodness, again, are predicated of man and of many other things, but it is not necessary that either the one quality or the other should be present in that of which they are predicated: it is not true to say that everything that may be good or bad must be either good or bad. These pairs of contraries have intermediates: the intermediates between white and black are grey, sallow, and all the other colours that come between; the intermediate between good and bad is that which is neither the one nor the other.
- Some intermediate qualities have names, such as grey and sallow and all the other colours that come between white and black; in other cases, however, it is not easy to name the intermediate, but we must define it as that which is *not* either extreme, as in the case of that which is neither good nor bad, neither just nor unjust.

(iii) 'Privatives' and 'positives' have reference to the

same subject. Thus, sight and blindness have reference to the eye. It is a universal rule that each of a pair of opposites of this type has reference to that to which the particular 'positive' is natural. We say that that which is capable of some particular faculty or possession has suffered privation when the faculty or possession in question is in no way present in that in which, and at the time at which, it should naturally be present. We do not call that toothless which has not teeth, or that blind which has not sight, but rather that which has not teeth or sight at the time when by nature it should. For there are some creatures which from birth are without sight, or without teeth, but these are not called toothless or blind.

To be without some faculty or to possess it is not the same as the corresponding 'privative' or 'positive'. 'Sight' is a 'positive', 'blindness' a 'privative', but 'to possess sight' is not equivalent to 'sight', 'to be blind' is not equivalent to 'blindness'. Blindness is a 'privative', to be blind is to be in a state of privation, but is not a 'privative'. Moreover, if 'blindness' were equivalent to 'being blind', both would be predicated of the same subject; but though a man is said to be blind, he is by no means said to be blindness.

To be in a state of 'possession' is, it appears, the opposite of being in a state of 'privation', just as 'positives' and 'privatives' themselves are opposite. There is the same type of antithesis in both cases; for just as blindness is opposed to sight, so is being blind opposed to having sight.

That which is affirmed or denied is not itself affirmation or denial. By 'affirmation' we mean an affirmative proposition, by 'denial' a negative. Now, those facts which form the matter of the affirmation or denial are not propositions; yet these two are said to be opposed in the same sense as the affirmation and denial, for in this case also the type of antithesis is the same. For as the affirmation is opposed to the denial, as in the two propositions 'he sits', 'he does not sit', so also the fact which constitutes the matter of the proposition in one case is opposed to that in the other, his sitting, that is to say, to his not sitting.

It is evident that 'positives' and 'privatives' are not opposed each to each in the same sense as relatives. The one is not explained by reference to the other; sight is not sight *of blindness*, nor is any other preposition used to indicate the relation. Similarly blindness is not said to be
 10 blindness *of sight*, but rather, privation of sight. Relatives, moreover, reciprocate; if blindness, therefore, were a relative, there would be a reciprocity of relation between it and that with which it was correlative. But this is not the case.
 15 Sight is not called the sight *of blindness*.

That those terms which fall under the heads of 'positives' and 'privatives' are not opposed each to each as contraries, either, is plain from the following facts: Of a pair of contraries such that they have *no* intermediate, one or the other must needs be present in the subject in which they
 30 naturally subsist, or of which they are predicated; for it is those, as we proved,¹ in the case of which this necessity obtains, that have no intermediate. Moreover, we cited health and disease, odd and even, as instances. But those contraries which *have* an intermediate are not subject to any such necessity. It is not necessary that every substance, receptive of such qualities, should be either black or white, cold or hot, for something intermediate between these
 35 contraries may very well be present in the subject. We proved, moreover, that those contraries have an intermediate in the case of which the said necessity does not obtain.² Yet when one of the two contraries is a constitutive property of the subject, as it is a constitutive property of fire to be hot, of snow to be white, it is necessary determinately that one of the two contraries, not one *or* the other, should be
 40 present in the subject;³ for fire cannot be cold, or snow black. Thus, it is not the case here that one of the two must needs be present in every subject receptive of these
 13^a qualities, but only in that subject of which the one forms a constitutive property. Moreover, in such cases it is one member of the pair determinately, and not either the one or the other, which must be present.

¹ Cf. 11^b 38.

² οὔτε . . . δεκτικῶν, ll. 33-7, is parenthetical.

³ Sc.: although they have intermediates.

In the case of 'positives' and 'privatives', on the other hand, neither of the aforesaid statements holds good. For it is not ¹ necessary that a subject receptive of the qualities should always have either the one or the other; that which has not yet advanced to the state when sight is natural is not said either to be blind or to see. Thus 'positives' and 'privatives' do not belong to that class of contraries which consists of those which have no intermediate. On the other hand, they do not belong either to that class which consists of contraries which have an intermediate. For under certain conditions it is necessary that either the one or the other should form part of the constitution of every appropriate subject. For when a thing has reached the stage when it is by nature capable of sight, it will be said either ¹⁰ to see or to be blind, and that in an indeterminate sense, signifying that the capacity may be either present or absent; for it is not necessary either that it should see or that it should be blind, but that it should be either in the one state or in the other. Yet in the case of those contraries which have an intermediate we found that it was never necessary that either the one or the other should be present in every appropriate subject, but only that in certain subjects one of the pair should be present and that in a determinate sense. It is, therefore, plain that 'positives' and 'privatives' are ¹⁵ not opposed each to each in either of the senses in which contraries are opposed.

Again, in the case of contraries, it is possible that there should be changes from either into the other, while the subject retains its identity, unless indeed one of the contraries is a constitutive property of that subject, as heat is of fire. For it is possible that that which is healthy should ²⁰ become diseased, that which is white, black, that which is cold, hot, that which is good, bad, that which is bad, good. The bad man, if he is being brought into a better way of life and thought, may make some advance, however slight, and if he should once improve, even ever so little, it is plain ²⁵ that he might change completely, or at any rate make very great progress, for a man becomes more and more easily

¹ Read *ofre* in l. 4 with B, C, and Waitz.

moved to virtue, however small the improvement was at first. It is, therefore, natural to suppose that he will make yet greater progress than he has made in the past; and as this process goes on, it will change him completely and establish him in the contrary state, provided he is not hindered by lack of time. In the case of 'positives' and 'privatives', however, change in both directions is impossible. There may be a change from possession to privation, but not from privation to possession. The man who has become blind does not regain his sight; the man who has become bald does not regain his hair; the man who has lost his teeth does not grow a new set.

13^b (iv) Statements opposed as affirmation and negation belong manifestly to a class which is distinct, for in this case, and in this case only, it is necessary for the one opposite to be true and the other false.

Neither in the case of contraries, nor in the case of correlatives, nor in the case of 'positives' and 'privatives', is it necessary for one to be true and the other false. Health and disease are contraries: neither of them is true or false. 'Double' and 'half' are opposed to each other as correlatives: neither of them is true or false. The case is the same, of course, with regard to 'positives' and 'privatives' such as 'sight' and 'blindness'. In short, where there is no sort of combination of words, truth and falsity have no place, and all the opposites we have mentioned so far consist of simple words.

At the same time, when the words which enter into opposed statements are contraries, these, more than any other set of opposites, would seem to claim this characteristic. 'Socrates is ill' is the contrary of 'Socrates is well', but not even of such composite expressions is it true to say that one of the pair must always be true and the other false. For if Socrates exists, one will be true and the other false, but if he does not exist, both will be false; for neither 'Socrates is ill' nor 'Socrates is well' is true, if Socrates does not exist at all.

13^c In the case of 'positives' and 'privatives', if the subject does not exist at all, neither proposition is true, but even if

the subject exists, it is not always the fact that one is true and the other false. For 'Socrates has sight' is the opposite of 'Socrates is blind' in the sense of the word 'opposite' which applies to possession and privation. Now if Socrates exists, it is not necessary that one should be true and the other false, for when he is not yet able to acquire the power of vision, both are false, as also if Socrates is altogether 25 *non-existent*.

But in the case of affirmation and negation, whether the subject exists or not, one is always false and the other true. For manifestly, if Socrates exists, one of the two propositions 'Socrates is ill', 'Socrates is not ill', is true, and the 30 other false. This is likewise the case if he does not exist; for if he does not exist, to say that he is ill is false, to say that he is not ill is true. Thus it is in the case of those opposites only, which are opposite in the sense in which the term is used with reference to affirmation and negation, that the rule holds good, that one of the pair must be true and the other false.

35

- II That the contrary of a good is an evil is shown by induction: the contrary of health is disease, of courage, cowardice, and so on. But the contrary of an evil is sometimes a 14^a good, sometimes an evil. For defect, which is an evil, has excess for its contrary, this also being an evil, and the mean, which is a good, is equally the contrary of the one and of the other. It is only in a few cases, however, that we see instances of this: in most, the contrary of an evil is 5 a good.

In the case of contraries, it is not always necessary that if one exists the other should also exist: for if all become healthy there will be health and no disease, and again, if everything turns white, there will be white, but no black. Again, since the fact that Socrates is ill is the contrary 10 of the fact that Socrates is well, and two contrary conditions cannot both obtain in one and the same individual at the same time, both these contraries could not exist at once: for if that Socrates was well was a fact, then that Socrates was ill could not possibly be one.

15 It is plain that contrary attributes must needs be present in subjects which belong to the same species or genus. Disease and health require as their subject the body of an animal; white and black require a body, without further qualification; justice and injustice require as their subject the human soul.

Moreover, it is necessary that pairs of contraries should in all cases either belong to the same genus or belong to 20 contrary genera or be themselves genera. White and black belong to the same genus, colour; justice and injustice, to contrary genera, virtue and vice; while good and evil do not belong to genera, but are themselves actual genera, with 25 terms under them.

There are four senses in which one thing can be said to be 12 'prior' to another. Primarily and most properly the term has reference to time: in this sense the word is used to indicate that one thing is older or more ancient than another, for the expressions 'older' and 'more ancient' imply greater length of time.

Secondly, one thing is said to be 'prior' to another 30 when the sequence of their being cannot be reversed. In this sense 'one' is 'prior' to 'two'. For if 'two' exists, it follows directly that 'one' must exist, but if 'one' exists, it does not follow necessarily that 'two' exists: thus the sequence subsisting cannot be reversed. It is agreed, then that when the sequence of two things cannot be reversed, then that one on which the other depends is called 'prior' 35 to that other.

In the third place, the term 'prior' is used with reference to any order, as in the case of science and of oratory. For in sciences which use demonstration there is that which is prior and that which is posterior in order, in geometry, 14^b the elements are prior to the propositions, in reading and writing,¹ the letters of the alphabet are prior to the syllables. Similarly, in the case of speeches, the exordium is prior in order to the narrative

¹ ἡ γραμματική, though generally most conveniently translated 'grammar', has a wider connotation than the English word.

Besides these senses of the word, there is a fourth. That which is better and more honourable is said to have a natural priority. In common parlance men speak of those 5 whom they honour and love as 'coming first' with them. This sense of the word is perhaps the most far-fetched.

Such, then, are the different senses in which the term 'prior' is used.

Yet it would seem that besides those mentioned there is 10 yet another. For in those things, the being of each of which implies that of the other, that which is in any way the cause may reasonably be said to be by nature 'prior' to the effect. It is plain that there are instances of this. The fact of the being of a man carries with it the truth of the proposition that he is, and the implication is reciprocal: for 15 if a man is, the proposition wherein we allege that he is is true, and conversely, if the proposition wherein we allege that he is is true, then he is. The true proposition, however, is in no way the cause of the being of the man, but the fact of the man's being does seem somehow to be the 20 cause of the truth of the proposition, for the truth or falsity of the proposition depends on the fact of the man's being or not being.

Thus the word 'prior' may be used in five senses.

- 13 The term 'simultaneous' is primarily and most appropriately applied to those things the genesis of the one of which is simultaneous with that of the other; for in such cases 25 neither is prior or posterior to the other. Such things are said to be simultaneous in point of time. Those things, again, are 'simultaneous' in point of nature, the being of each of which involves that of the other, while at the same time neither is the cause of the other's being. This is the case with regard to the double and the half, for these are reciprocally dependent, since, if there is a double, there is also 30 a half, and if there is a half, there is also a double, while at the same time neither is the cause of the being of the other.

Again, those species which are distinguished one from another and opposed one to another within the same genus

are said to be 'simultaneous' in nature. I mean those species which are distinguished each from each by one
 35 and the same method of division. Thus the 'winged' species is simultaneous with the 'terrestrial' and the 'water' species. These are distinguished within the same genus, and are opposed each to each, for the genus 'animal' has the 'winged', the 'terrestrial', and the 'water' species, and no one of these is prior or posterior to another; on the contrary, all such things appear to be 'simultaneous' in
 15^a nature. Each of these also, the terrestrial, the winged, and the water species, can be divided again into subspecies. Those species, then, also will be 'simultaneous' in point of nature, which, belonging to the same genus, are distinguished each from each by one and the same method of differentiation.

5 But genera are prior to species, for the sequence of their being cannot be reversed. If there is the species 'water-animal', there will be the genus 'animal', but granted the being of the genus 'animal', it does not follow necessarily that there will be the species 'water-animal'.

Those things, therefore, are said to be 'simultaneous' in nature, the being of each of which involves that of the other, while at the same time neither is in any way the cause of
 10 the other's being; those species, also, which are distinguished each from each and opposed within the same genus. Those things, moreover, are 'simultaneous' in the unqualified sense of the word which come into being at the same time.

There are six sorts of movement: generation, destruction, 14 increase, diminution, alteration, and change of place.

15 It is evident in all but one case that all these sorts of movement are distinct each from each. Generation is distinct from destruction, increase and change of place from diminution, and so on. But in the case of alteration it may be argued that the process necessarily implies one or other
 20 of the other five sorts of motion. This is not true, for we may say that all affections, or nearly all, produce in us an alteration which is distinct from all other sorts of motion, for that which is affected need not suffer either increase or

diminution or any of the other sorts of motion. Thus alteration is a distinct sort of motion; for, if it were not, the thing altered would not only be altered, but would forthwith necessarily suffer increase or diminution or some one of the other sorts of motion in addition; which as a matter of fact is not the case. Similarly that which was undergoing the process of increase or was subject to some other sort of motion would, if alteration were not a distinct form of motion, necessarily be subject to alteration also. But there are some things which undergo increase but yet not alteration. The square, for instance, if a gnomon is applied to it, undergoes increase but not alteration,¹ and so it is with all other figures of this sort. Alteration and increase, therefore, are distinct.

Speaking generally, rest is the contrary of motion. But the different forms of motion have their own contraries in other forms; thus destruction is the contrary of generation, diminution of increase, rest in a place, of change of place. As for this last, change in the reverse direction would seem to be most truly its contrary; thus motion upwards is the contrary of motion downwards and vice versa.

In the case of that sort of motion which yet remains, of those that have been enumerated, it is not easy to state what is its contrary. It appears to have no contrary, unless one should define the contrary here also either as 'rest in its quality' or as 'change in the direction of the contrary quality', just as we defined the contrary of change of place either as rest in a place or as change in the reverse direction. For a thing is altered when change of quality takes place; therefore either rest in its quality or change in the direction of the contrary quality may be called the contrary of this qualitative form of motion. In this way becoming white is the contrary of becoming black; there is alteration in the contrary direction, since a change of a qualitative nature takes place.

- 5 The term 'to have' is used in various senses. In the first place it is used with reference to habit or disposition or

¹ As in the figure , the square remains a square, though increased in area by the addition of the gnomon.

any other quality, for we are said to 'have' a piece of knowledge or a virtue. Then, again, it has reference to quantity,
20 as. for instance, in the case of a man's height; for he is said to 'have' a height of three cubits or four cubits. It is used, moreover, with regard to apparel, a man being said to 'have' a coat or tunic; or in respect of something which we have on a part of ourselves, as a ring on the hand: or in respect of something which is a part of us, as hand or foot. The term refers also to content, as in the case of a vessel and wheat, or of a jar and wine; a jar is said to 'have'
25 wine, and a corn-measure wheat. The expression in such cases has reference to content. Or it refers to that which has been acquired; we are said to 'have' a house or a field. A man is also said to 'have' a wife, and a wife a husband, and this appears to be the most remote meaning of the
30 term, for by the use of it we mean simply that the husband lives with the wife.

Other senses of the word might perhaps be found, but the most ordinary ones have all been enumerated.

DE INTERPRETATIONE

TABLE OF CONTENTS

- Ch. 1.** (1) The spoken word is a symbol of thought.
(2) Isolated thoughts or expressions are neither true nor false.
(3) Truth and falsehood are only attributable to certain combinations of thoughts or of words.
- Ch. 2.** (1) Definition of a noun.
(2) Simple and composite nouns.
(3) Indefinite nouns.
(4) Cases of a noun.
- Ch. 3.** (1) Definition of a verb.
(2) Indefinite verbs.
(3) Tenses of a verb.
(4) Verbal nouns and adjectives.
- Ch. 4.** Definition of a sentence.
- Ch. 5.** Simple and compound propositions.
- Ch. 6.** Contradictory propositions.
- Ch. 7.** (1) Universal, indefinite, and particular affirmations and denials.
(2) Contrary as opposed to contradictory propositions.
(3) In contrary propositions, of which the subject is universal or particular, the truth of the one proposition implies the falsity of the other, but this is not the case in indefinite propositions.
- Ch. 8.** Definition of single propositions.
- Ch. 9.** Propositions which refer to present or past time must be either true or false: propositions which refer to future time must be either true or false, but it is not determined which must be true and which false.
- Ch. 10.** (1) Diagrammatic arrangement of pairs of affirmations and denials, (*a*) without the complement of the verb 'to be', (*b*) with the complement of the verb 'to be', (*c*) with an indefinite noun for subject.
(2) The right position of the negative.
(3) Contraries can never both be true, but subcontraries may both be true.

TABLE OF CONTENTS

- (4) In particular propositions, if the affirmative is false, the contrary is true; in universal propositions, if the affirmative is false, the contradictory is true.
 - (5) Propositions consisting of an indefinite noun and an indefinite verb are not denials.
 - (6) The relation to other propositions of those which have an indefinite noun as subject.
 - (7) The transposition of nouns and verbs makes no difference to the sense of the proposition.
- Ch. 11.** (1) Some seemingly simple propositions are really compound.
- (2) Similarly some dialectical questions are really compound.
 - (3) The nature of a dialectical question.
 - (4) When two simple propositions having the same subject are true, it is not necessarily the case that the proposition resulting from the combination of the predicates is true.
 - (5) A plurality of predicates which individually belong to the same subject can only be combined to form a simple proposition when they are essentially predicable of the subject, and when one is not implicit in another.
 - (6) A compound predicate cannot be resolved into simple predicates when the compound predicate has within it a contradiction in terms, or when one of the predicates is used in a secondary sense.
- Ch. 12.** (1) Propositions concerning possibility, impossibility, contingency, and necessity.
- (2) Determination of the proper contradictories of such propositions.
- Ch. 13.** (1) Scheme to show the relation subsisting between such propositions.
- (2) Illogical character of this scheme proved.
 - (3) Revised scheme.
 - (4) That which is said to be possible may be (a) always actual, (b) sometimes actual and sometimes not, (c) never actual.
- Ch. 14.** Discussion as to whether a contrary affirmation or a denial is the proper contrary of an affirmation, either universal or particular.

DE INTERPRETATIONE

- 1 FIRST we must define the terms 'noun' and 'verb', then 16^a
the terms 'denial' and 'affirmation', then 'proposition' and
'sentence'.

Spoken words are the symbols of mental experience and written words are the symbols of spoken words. Just as 5
all men have not the same writing, so all men have not the same speech sounds, but the mental experiences, which these directly symbolize, are the same for all, as also are those things of which our experiences are the images. This matter has, however, been discussed in my treatise about the soul, for it belongs to an investigation distinct from that which lies before us.¹

As there are in the mind thoughts which do not involve truth or falsity, and also those which must be either true or 10
false, so it is in speech. For truth and falsity imply combination and separation. Nouns and verbs, provided nothing is added, are like thoughts without combination or separation; 'man' and 'white', as isolated terms, are not 15
yet either true or false. In proof of this, consider the word 'goat-stag'. It has significance, but there is no truth or falsity about it, unless 'is' or 'is not' is added, either in the present or in some other tense.

- 2 By a noun we mean a sound significant by convention, which has no reference to time, and of which no part is 20
significant apart from the rest. In the noun 'Fairsteed', the part 'steed' has no significance in and by itself, as in the phrase 'fair steed'. Yet there is a difference between simple and composite nouns; for in the former the part is in no way significant, in the latter it contributes to the 25
meaning of the whole, although it has not an independent

¹ Great difficulty has been found in discovering any passage of the *De Anima* to which this can refer. Maier is probably right in holding that this sentence should come after the next two (after ἀληθείς, l. 13), and refers to *De An.* 430^a 26-8.

meaning. Thus in the word 'pirate-boat' the word 'boat' has no meaning except as part of the whole word.¹

The limitation 'by convention' was introduced because nothing is by nature a noun or name—it is only so when it becomes a symbol; inarticulate sounds, such as those which brutes produce, are significant, yet none of these constitutes a noun.

- 30 The expression 'not-man' is not a noun. There is indeed no recognized term by which we may denote such an expression, for it is not a sentence or a denial. Let it then be called an indefinite noun.²

16^b The expressions 'of Philo', 'to Philo', and so on, constitute not nouns, but cases of a noun. The definition of these cases of a noun is in other respects the same as that of the noun proper, but, when coupled with 'is', 'was', or 'will be', they do not, as they are, form a proposition either true or false, and this the noun proper always does, under these conditions. Take the words 'of Philo is' or 'of Philo is not'; these words do not, as they stand, form either a true or a false proposition.

A verb is that which, in addition to its proper meaning, 3 carries with it the notion of time. No part of it has any independent meaning, and it is a sign of something said of something else.

I will explain what I mean by saying that it carries with it the notion of time. 'Health' is a noun, but 'is healthy' is a verb; for besides its proper meaning it indicates the present existence of the state in question.

- 10 Moreover, a verb is always a sign of something said of something else, i.e. of something either predicable of or present in some other thing.

Such expressions as 'is not-healthy', 'is not-ill', I do not describe as verbs; for though they carry the additional note of time, and always form a predicate, there is no specified name for this variety; but let them be called

¹ i.e. as in the case of a chemical compound, so in that of compound words, the elements, being amalgamated into one whole, cease to have their own particular character and significance.

² Omit *ἐν* . . . *μὴ ὄντος*, ll. 32, 33, with A, B, and Waitz. These words have probably been introduced from ^b 15.

indefinite verbs, since they apply equally well to that which exists and to that which does not.

Similarly 'he was healthy', 'he will be healthy', are not verbs, but tenses of a verb; the difference lies in the fact that the verb indicates present time, while the tenses of the verb indicate those times which lie outside the present.

Verbs in and by themselves are substantival and have significance, for he who uses such expressions arrests the hearer's mind, and fixes his attention; but they do not, as they stand, express any judgement, either positive or negative. For neither are 'to be' and 'not to be' and the participle 'being' significant of any fact,¹ unless something is added; for they do not themselves indicate anything, but imply a copulation, of which we cannot form a conception apart from the things coupled.

- 4 A sentence is a significant portion of speech,² some parts of which have an independent meaning, that is to say, as an utterance, though not as the expression of any positive judgement.³ Let me explain. The word 'human' has meaning, but does not constitute a proposition, either positive or negative. It is only when other words are added that the whole will form an affirmation or denial. But if we separate one syllable of the word 'human' from the other, it has no meaning; similarly in the word 'mouse', the part '-ouse' has no meaning in itself, but is merely a sound. In composite words, indeed, the parts contribute to the meaning of the whole; yet, as has been pointed out,⁴ they have not an independent meaning.

Every sentence has meaning, not as being the natural means by which a physical faculty is realized, but, as we have said, by convention. Yet every sentence is not a proposition; only such are propositions as have in them either truth or falsity. Thus a prayer is a sentence, but is neither true nor false.

¹ The words 'to be' and 'not to be' are here regarded in their strictly copulative sense.

² Omit κατὰ συνθήκην in l. 26 with B, C, Amm., Boeth., and Waitz.

³ Omit ἢ ἀπόφασις in l. 28 with B, C, Amm., and Waitz.

⁴ Cf. 16^a 22-26.

- 5 Let us therefore dismiss all other types of sentence but the proposition, for this last concerns our present inquiry, whereas the investigation of the others belongs rather to the study of rhetoric or of poetry.¹

The first class of simple propositions is the simple affirmation, the next, the simple denial; all others are only one by conjunction.

- 10 Every proposition must contain a verb or the tense of a verb. The phrase which defines the species 'man', if no verb in present, past, or future time be added, is not a proposition. It may be asked how the expression 'a footed animal with two feet' can be called single; for it is not the circumstance that the words follow in unbroken succession that effects the unity. This inquiry, however, finds its place in an investigation foreign to that before us.²

- 15 We call those propositions single which indicate a single fact, or the conjunction of the parts of which results in unity: those propositions, on the other hand, are separate and many in number, which indicate many facts, or whose parts have no conjunction.

Let us, moreover, consent to call a noun or a verb an expression only, and not a proposition, since it is not possible for a man to speak in this way when he is expressing something, in such a way as to make a statement, whether his utterance is an answer to a question or an act of his own initiation.

- 20 To return: of propositions one kind is simple, i. e. that which asserts or denies something of something, the other composite, i. e. that which is compounded of simple propositions. A simple proposition is a statement, with meaning, as to the presence of something in a subject or its absence, in the present, past, or future, according to the divisions of time.

- 25 An affirmation is a positive assertion of something about 6 something, a denial a negative assertion.

¹ Cf. *Poet.* 1456^b 11.

² Cf. *Met. Z.* 12, H. 6. Read οὐ . . . ἔσται l. 14 in brackets, with a comma following.

Now it is possible both to affirm and to deny the presence of something which is present or of something which is not, and since these same affirmations and denials are possible with reference to those times which lie outside the present, it would be possible to contradict any affirmation or denial.³⁰ Thus it is plain that every affirmation has an opposite denial, and similarly every denial an opposite affirmation.

We will call such a pair of propositions a pair of contradictories. Those positive and negative propositions are said to be contradictory which have the same subject and predicate. The identity of subject and of predicate must³⁵ not be 'equivocal'. Indeed there are definitive qualifications besides this, which we make to meet the casuistries of sophists.

- 7 Some things are universal, others individual. By the term 'universal' I mean that which is of such a nature as to be predicated of many subjects, by 'individual' that which is not thus predicated. Thus 'man' is a universal, 'Callias' ⁴⁰ an individual.

Our propositions necessarily sometimes concern a uni-^{17^b}versal subject, sometimes an individual.

If, then, a man states a positive and a negative proposition of universal character with regard to a universal, these two propositions are 'contrary'. By the expression ⁵ 'a proposition of universal character with regard to a universal', such propositions as 'every man is white', 'no man is white' are meant. When, on the other hand, the positive and negative propositions, though they have regard to a universal, are yet not of universal character, they will not be contrary, albeit the meaning intended is sometimes contrary.¹ As instances of propositions made with regard to a universal, but not of universal character, we may take the propositions 'man is white', 'man is not white'. 'Man' ¹⁰ is a universal, but the proposition is not made as of universal character; for the word 'every' does not make the subject a universal, but rather gives the proposition a

¹ Read a comma after *ἕκαστον* l. 1, a colon after *ἕκαστον* l. 3, and place λέγω . . . οὐδείς *ἄνθρωπος* λευκός, ll. 5, 6, in brackets, followed by a colon. Bonitz has thus cleared up the construction of the sentence.

universal character. If, however, both predicate and subject are distributed, the proposition thus constituted is contrary to truth; no affirmation will, under such circumstances, be true. The proposition 'every man is every animal' is an example of this type.

An affirmation is opposed to a denial in the sense which I denote by the term 'contradictory', when, while the subject remains the same, the affirmation is of universal character and the denial is not. The affirmation 'every man is white' is the *contradictory* of the denial 'not every man is white', or again, the proposition 'no man is white' is the *contradictory* of the proposition 'some men are white'.¹

20 But propositions are opposed as *contraries* when both the affirmation and the denial are universal, as in the sentences 'every man is white', 'no man is white', 'every man is just', 'no man is just'.

We see that in a pair of this sort both propositions cannot be true, but the contradictories of a pair of contraries can sometimes both be true with reference to the same subject; for instance 'not every man is white' and 'some men are white' are both true. Of such corresponding positive and negative propositions as refer to universals and have a universal character,² one must be true and the other false. This is the case also when the reference is to individuals, as in the propositions 'Socrates is white', 'Socrates is not white'.

When, on the other hand, the reference is to universals, but the propositions are not universal, it is not always the case that one is true and the other false, for it is possible to state truly that man is white and that man is not white and that man is beautiful and that man is not beautiful; for if a man is deformed he is the reverse of beautiful, also if he is progressing towards beauty he is not yet beautiful.

This statement might seem at first sight to carry with it

| | |
|----------------------------|---|
| Every man is white = A | } according to the usual logical formula. |
| No man is white = E | |
| Some men are white = I | |
| Not every man is white = O | |

² Strictly 'one of which has a universal character'.

a contradiction, owing to the fact that the proposition 'man 35 is not white' appears to be equivalent to the proposition 'no $\mu\alpha\tau\eta$ is white'. This, however, is not the case, nor are they necessarily at the same time true or false.

It is evident also that the denial corresponding to a single affirmation is itself single; for the denial must deny just that which the affirmation affirms concerning the same subject, and must correspond with the affirmation both in the universal or particular character of the subject and 18^a in the distributed or undistributed sense in which it is understood.

For instance, the affirmation 'Socrates is white' has its proper denial in the proposition 'Socrates is not white'. If anything else be negatively predicated of the subject or if anything else be the subject though the predicate remain the same, the denial will not be the denial proper to that affirmation, but one that is distinct.

The denial proper to the affirmation 'every man is white' is 'not every man is white'; that proper to the affirmation 5 'some men are white' is 'no man is white', while that proper to the affirmation 'man is white' is 'man is not white'.

We have shown further that a single denial is contradictorily opposite to a single affirmation and we have explained which these are; we have also stated that contrary are distinct from contradictory propositions and which the contrary are; also that with regard to a pair of opposite 10 propositions it is not always the case that one is true and the other false.¹ We have pointed out, moreover, what the reason of this is and under what circumstances the truth of the one involves the falsity of the other.

- 8 An affirmation or denial is single, if it indicates some one fact about some one subject; it matters not whether the subject is universal and whether the statement has a universal character, or whether this is not so. Such single

¹ By the words ἀληθείς ἢ ψευδής, as Waitz explains, Aristotle means ἀντίφασις, τὴν μὲν ἀεὶ ἔχουσα ἀληθείᾱ, τὴν δὲ ψευδῇ. The subcontraries, that is, contradictories of the contraries, may both be true. Cf. 17^b 31.

propositions are: 'every man is white', 'not every man is
 15 white'; 'man is white', 'man is not white'; 'no man
 is white', 'some men are white'; provided the word 'white'
 has one meaning. If, on the other hand, one word has two
 meanings which do not combine to form one, the affirma-
 tion is not single.¹ For instance, if a man should establish
 the symbol 'garment' as significant both of a horse and of
 20 a man, the proposition 'garment is white' would not be a
 single affirmation, nor its opposite a single denial. For it is
 equivalent to the proposition 'horse and man are white',
 which, again, is equivalent to the two propositions 'horse is
 white', 'man is white'. If, then, these two propositions
 have more than a single significance, and do not form
 a single proposition, it is plain that the first proposition
 25 either has more than one significance or else has none; for a
 particular man is not a horse.

This, then, is another instance of those propositions of
 which both the positive and the negative forms may be true
 or false simultaneously.

In the case of that which is or which has taken place, 9
 propositions, whether positive or negative, must be true or
 false. Again, in the case of a pair of contradictories, either
 when the subject is universal and the propositions are of a
 30 universal character,² or when it is individual, as has been
 said,³ one of the two must be true and the other false;
 whereas when the subject is universal, but the propositions
 are not of a universal character, there is no such necessity.
 We have discussed this type also in a previous chapter.⁴

When the subject, however, is individual, and that which
 is predicated of it relates to the future, the case is altered.⁵

¹ Omit *οὐδὲ ἀντίφασις μία* in l. 19 with B, Amm., and Waitz.

² Aristotle means that if you start with a universal proposition (A or E) and take the corresponding negation (by which he means O or I), one must be true and the other false.

³ Cf. 17^b 26-9.

⁴ Cf. 17^b 29-37.

⁵ In this chapter, as Pacius points out, Aristotle deals with four possible theories as to contradictory propositions concerning the future: (1) that both are true; this he refutes, 18^a 34-9, by implication; (2) that one is true and the other false determinately; this he deals with at length; (3) that both are false; this he dismisses, 18^b 16-25; (4) that one is true and the other false, indeterminately; this last he commends, 19^a 23-b 4.

For if all propositions whether positive or negative¹ are either true or false, then any given predicate must either ³⁵ belong to the subject or not, so that if one man affirms that an event of a given character will take place and another denies it, it is plain that the statement of the one will correspond with reality and that of the other will not. For the predicate cannot both belong and not belong to the subject at one and the same time with regard to the future.

Thus, if it is true to say that a thing is white, it must ^{18^b} necessarily be white; if the reverse proposition is true, it will of necessity not be white. Again, if it is white, the proposition stating that it is white was true; if it is not white, the proposition to the opposite effect was true. And if it is not white, the man who states that it is is making a false statement; and if the man who states that it is white is making a false statement, it follows that it is not white. It may therefore be argued that it is necessary that affirmations or denials must be either true or false.

Now if this be so, nothing is or takes place fortuitously, ⁵ either in the present or in the future, and there are no real alternatives; everything takes place of necessity and is fixed. For either he that affirms that it will take place or he that denies this is in correspondence with fact, whereas if things did not take place of necessity, an event might just as easily not happen as happen; for the meaning of the word 'fortuitous' with regard to present or future events is that reality is so constituted that it may issue in either of two opposite directions.

Again, if a thing is white now, it was true before to say ¹⁰ that it would be white, so that of anything that has taken place it was always true to say 'it is' or 'it will be'. But if it was always true to say that a thing is or will be, it is not possible that it should not be or not be about to be, and when a thing cannot not come to be, it is impossible

¹ In 18^a 34, 38 Bekker reads *καί*, but it seems better to adhere to the reading *ἢ*, which is that of B, C, Amm., and Waitz, since the phrase occurs in ^a 29, ^b 4 in the same sense: i.e. propositions, whether positive or negative.

that it should not come to be, and when it is impossible that it should not come to be, it must come to be. All, 15 then, that is about to be must of necessity take place. It results from this that nothing is uncertain or fortuitous, for if it were fortuitous it would not be necessary.

Again, to say that neither the affirmation nor the denial is true, maintaining, let us say, that an event neither will take place nor will not take place, is to take up a position impossible to defend. In the first place, though facts should prove the one proposition false, the opposite would still be 20 untrue.¹ Secondly, if it was true to say that a thing was both white and large, both these qualities must necessarily belong to it; and if they will belong to it the next day,² they must necessarily belong to it the next day.³ But if an event is neither to take place nor not to take place the next day, the element of chance will be eliminated.⁴ For example, it would be necessary that a sea-fight should neither 25 take place nor fail to take place on the next day.

These awkward results and others of the same kind follow, if it is an irrefragable law that of every pair of contradictory propositions, whether they have regard to universals and are stated as universally applicable, or whether they have regard to individuals, one must be true and the 30 other false, and that there are no real alternatives, but that all that is or takes place is the outcome of necessity. There would be no need to deliberate or to take trouble, on the supposition that if we should adopt a certain course, a certain result would follow, while, if we did not, the result would not follow. For a man may predict an event ten thousand years beforehand, and another may predict the 35 reverse; that which was truly predicted at the moment in the past will⁵ of necessity take place in the fullness of time.

¹ *sc.* 'ex hypothesi': and thus the Law of Excluded Middle would be violated'.

² Or: 'if it was true to say that they would belong to it'; and below: 'if it was true to say that an event . . .'. Possibly Pacius is right in his contention that ἀληθὲς ἦν εἰπεῖν ὅτι should be understood after εἰ δέ in both cases.

³ 18^b 23 read ὑπάρχειν εἰς αἴριον with A, B, Amm., and Waitz.

⁴ *sc.* 'and thus this suggestion does not prove any amendment on the first'.

sc. 'on our hypothesis'.

Further, it makes no difference whether people have or have not actually made the contradictory statements. For it is manifest that the circumstances are not influenced by the fact of an affirmation or denial on the part of anyone. For events will not take place or fail to take place because it was stated that they would or would not take place, nor is this any more the case if the prediction dates back ten thousand years or any other space of time. Wherefore, if 19^a through all time the nature of things was so constituted that a prediction about an event was true, then through all time it was necessary that that prediction should find fulfilment; and with regard to all events,¹ circumstances have always been such that their occurrence is a matter of necessity. For that of which someone has said truly that it will be, cannot fail to take place; and of that which takes 5 place, it was always true to say that it would be.

Yet this view leads to an impossible conclusion; for we see that both deliberation and action are causative with regard to the future, and that, to speak more generally, in those things which are not continuously actual there is a potentiality in either direction. Such things may either be 10 or not be; events also therefore may either take place or not take place. There are many obvious instances of this. It is possible that this coat may be cut in half, and yet it may not be cut in half, but wear out first. In the same way, it is possible that it should not be cut in half; unless this 15 were so, it would not be possible that it should wear out first. So it is therefore with all other events which possess this kind of potentiality. It is therefore plain that it is not of necessity that everything is or takes place; but in some instances there are real alternatives, in which case the affirmation is no more true and no more false than the denial; while some exhibit a predisposition and general 20 tendency in one direction or the other, and yet can issue in the opposite direction by exception.²

Now that which is must needs be when it is, and that which is not must needs not be when it is not. Yet it can-

¹ sc. 'on our hypothesis'.

² Bonitz has pointed out that ὁρῶμεν l. 7-τοιαύτην l. 18 is parenthetical, φανερόν beginning the apodosis of the main sentence.

not be said without qualification that all existence and non-existence is the outcome of necessity. For there is a
 25 difference between saying that that which is, when it is, must needs be, and simply saying that all that is must needs be, and similarly in the case of that which is not. In the case, also, of two contradictory propositions this holds good. Everything must either be or not be, whether in the present or in the future, but it is not always possible to distinguish and state determinately which of these alternatives must necessarily come about.

30 Let me illustrate. A sea-fight must either take place to-morrow or not, but it is not necessary that it should take place to-morrow, neither is it necessary that it should not take place, yet it is necessary that it either should or should not take place to-morrow. Since propositions correspond with facts, it is evident that when in future events there is a real alternative, and a potentiality in contrary directions, the corresponding affirmation and denial have the same character.

35 This is the case with regard to that which is not always existent or not always non-existent. One of the two propositions in such instances must be true and the other false, but we cannot say determinately that this or that is false, but must leave the alternative undecided. One may indeed be more likely to be true than the other, but it cannot be either actually true or actually false. It is therefore
 19^b plain that it is not necessary that of an affirmation and a denial one should be true and the other false.¹ For in the case of that which exists potentially, but not actually, the rule which applies to that which exists actually does not hold good. The case is rather as we have indicated.

5 An affirmation is the statement of a fact with regard to a subject, and this subject is either a noun or that which has no name; the subject and predicate in an affirmation must each denote a single thing. I have already explained² what is meant by a noun and by that which has no name; for I stated that the expression 'not-man' was not a noun, in the proper sense of the word, but an indefinite noun, denoting

¹ sc. ἀφωρισμένως 'determinately'.

² Cf. 16^a 19, 30.

as it does in a certain sense a single thing. Similarly the expression 'does not enjoy health' is not a verb proper, but an indefinite verb. Every affirmation, then, and every denial, 10 will consist of a noun and a verb, either definite or indefinite.

There can be no affirmation or denial without a verb; for the expressions 'is', 'will be', 'was', 'is coming to be', and the like are verbs according to our definition, since besides their specific meaning they convey the notion of time.

Thus the primary affirmation and denial are as follows: 'man is', 'man is not'. Next to these, there are the propo- 15 sitions: 'not-man is', 'not-man is not'. Again we have the propositions: 'every man is', 'every man is not', 'all that is not-man is', 'all that is not-man is not'. The same classification holds good with regard to such periods of time as lie outside the present.

When the verb 'is' is used as a third element in the sentence, there can be positive and negative propositions of two sorts.¹ Thus in the sentence 'man is just' the verb 20 'is' is used as a third element, call it verb or noun, which you will. Four propositions,² therefore, instead of two can be formed with these materials. Two of the four, as regards their affirmation and denial, correspond in their logical sequence with the propositions which deal with a condition of privation;³ the other two do not correspond with these.⁴

¹ Waitz argues that the use of the word *προσκατηγορεῖται* implies that the verb 'to be' is not here regarded as a copula, i.e. that the sentence *ἐστὶ δίκαιος ἄνθρωπος* should be translated 'there is a just man'. As a matter of fact, however, when interpreted as strictly indefinite, the proposition 'man is just' means exactly the same as the proposition 'there is a just man'. An objection to Waitz's contention is that Aristotle expressly refuses to define the function of *ἐστὶ* in these propositions, but calls it *ὄνομα ἢ ῥῆμα*. It is difficult to see why it should not be defined as *ῥῆμα*, if it were being used in its independent sense. Besides this, in the form of proposition adopted by Waitz 'just man' is one term; the whole therefore consists not of three elements, but of two.

² Four propositions, not four pairs of propositions. The objection to Grote's rendering lies in the fact that while he translates *τέτταρα* here as 'four pairs', he makes *τὰ μὲν δύο* mean one pair (i.e. the second pair of the first quaternion) and *τὰ δὲ δύο* another single pair (i.e. the second pair of the second quaternion, of which *οὐκ ἄνθρωπος* is the subject).

³ In the subjoined table to which Aristotle refers, *D* follows from *A* and *B* from *C* and the sequence is the same as it would be if 'unjust' were substituted for 'not-just'.

⁴ Let *c* represent the proposition 'man is unjust' and *d* the proposi-

I mean that the verb 'is' is added either to the term
 25 'just' or to the term 'not-just',¹ and two negative propositions are formed in the same way. Thus we have the four propositions. Reference to the subjoined table will make matters clear :

| | |
|---------------------------------|----------------------------------|
| A. Affirmation. Man is just. | B. Denial. Man is not just. |
| D. Denial. Man is not not-just. | C. Affirmation. Man is not-just. |

Here 'is' and 'is not' are added either to 'just' or to 'not-
 30 just'. This then is the proper scheme for these propositions, as has been said in the *Analytica*.² The same rule holds good, if the subject is distributed. Thus we have the table:

| | |
|---|---|
| A'. Affirmation. Every man is just. | B'. Denial. Not every man is just. |
| D'. Denial. Not every man is [not-just] | C'. Affirmation. Every man is [not-just]. |

35 Yet here it is not possible, in the same way as in the former case, that the propositions joined in the table by a diagonal line should both be true, though under certain circumstances this is the case.³

We have thus set out two pairs of opposite propositions ;

tion 'man is not unjust'. *D* and *C* correspond with *d* and *c*, *A* and *B* do not

¹ 19^b 25-30. Waitz reads *ἀνθρώπων* for *δικαίων* and *οὐκ ἀνθρώπων* for *οὐ δικαίων* and maintains that in both cases *δικαίων* is understood before *ἀνθρώπων* and that this has in some MSS. caused the easier reading *δικαίων, οὐ δικαίων* to supplant the true. The omission of *δικαίων* between *οὐ* and *ἀνθρώπων* is obviously impossible, and there is no other way of taking the words, should that reading be adopted. To those, however, who consider *ἐστὶ* to be the copula in all these propositions, there can be no question as to the reading, *δικαίων* and *οὐ δικαίων* being necessary to the argument.

² *Analytica Priora*, 51^b 36-52^a 17.

³ *D'* and *B'* may both be true.

there are moreover two other pairs,¹ if a term be conjoined² with 'not-man', the latter forming a kind of subject. Thus:

A". Not-man is just.

B". Not-man is not just.

D". Not-man is not not-just.

C". Not-man is not-just.

This is an exhaustive enumeration of all the pairs of opposite^{20a} propositions that can possibly be framed. This last group should remain distinct from those which preceded it, since it employs as its subject the expression 'not-man'.

When the verb 'is' does not fit the structure of the sentence (for instance, when the verbs 'walks', 'enjoys health' are used), that scheme applies, which applied when the word 'is' was added.

Thus we have the propositions: 'every man enjoys health',⁵ 'every man does-not-enjoy-health', 'all that is not-man enjoys health', 'all that is not-man does-not-enjoy-health'.

We must not in these propositions use the expression 'not every man'. The negative must be attached to the word 'man', for the word 'every' does not give to the subject a universal significance, but implies that, as a subject, it is distributed. This is plain from the following pairs:¹⁰ 'man enjoys health', 'man does not enjoy health'; 'not-man enjoys health', 'not-man does not enjoy health'. These propositions differ from the former in being indefinite and not universal in character. Thus the adjectives 'every' and 'no' have no additional significance except that the subject, whether in a positive or in a negative sentence, is distributed. The rest of the sentence, therefore, will in each case be the same.

15

Since the contrary of the proposition 'every animal is just' is 'no animal is just', it is plain that these two proposi-

¹ Here δύο must mean two pairs, whereas τὰ μὲν δύο in l. 23 means two propositions. This irregularity is not impossible, and the use of the feminine here (ἀντιφάσεις being understood) as opposed to the neuter above makes all the difference.

² Read προστεθέντος in l. 38 with A, B, C, Amm., and Waitz.

tions will never both be true at the same time or with reference to the same subject. Sometimes, however, the contradictories of these contraries will both be true, as in the instance before us: the propositions 'not every animal is just' and 'some animals are just' are both true.

- 20 Further, the proposition 'no man is just' follows from the proposition 'every man is not-just' and the proposition 'not every man is not-just', which is the opposite of 'every man is not-just', follows from the proposition 'some men are just'; for if this be true, there must be some just men.

It is evident, also, that when the subject is individual, if a question is asked and the negative answer is the true one,
 25 a certain positive proposition is also true. Thus, if the question were asked 'Is Socrates wise?' and the negative answer were the true one, the positive inference 'Then Socrates is unwise' is correct. But no such inference is correct in the case of universals, but rather a negative proposition. For instance, if to the question 'Is every man wise?' the answer is 'no', the inference 'Then every man is unwise' is false. But under these circumstances the
 30 inference 'Not every man is wise' is correct. This last is the contradictory, the former the contrary.¹ Negative expressions,² which consist of an indefinite noun or predicate, such as 'not-man' or 'not-just', may seem to be denials containing neither noun nor verb in the proper sense of the words. But they are not. For a denial must always be
 35 either true or false, and he that uses the expression 'not-man', if nothing more be added, is not nearer but rather further from making a true or a false statement than he who uses the expression 'man'.³

The propositions 'everything that is not man is just', and the contradictory of this, are not equivalent to any of the other propositions; on the other hand, the proposition 'everything that is not man is not just' is equivalent to the
 40 proposition 'nothing that is not man is just'.

¹ *sc.* 'to that which would form the positive answer to the question'.

² *ai . . . ἀντικείμεναι* agrees loosely with the succeeding ἀποφάνσεις, although the noun is not really applicable.

³ Presumably because the indefinite noun has less complete meaning than the noun proper.

The conversion of the position of subject and predicate in 20^b a sentence involves no difference in its meaning. Thus we say 'man is white' and 'white is man'.¹ If these were not equivalent, there would be more than one contradictory to the same proposition, whereas it has been demonstrated² that each proposition has one proper contradictory and one only. For of the proposition 'man is white' the appropriate contradictory is 'man is not white', and of the proposition 5 'white is man', if its meaning be different, the contradictory will either be 'white is not not-man' or 'white is not man'. Now the former of these is the contradictory of the proposition 'white is not-man', and the latter of these is the contradictory of the proposition 'man is white';³ thus there will be two contradictories to one proposition.

It is evident, therefore, that the inversion of the relative 10 position of subject and predicate does not affect the sense of affirmations and denials.

- II There is no unity about an affirmation or denial which, either positively or negatively, predicates one thing of many subjects, or many things of the same subject, unless that which is indicated by the many is really some one thing.

I do not apply this word 'one' to those things which, 15 though they have a single recognized name, yet do not combine to form a unity. Thus, man may be an animal, and biped, and domesticated, but these three predicates combine to form a unity. On the other hand, the predicates 'white', 'man', and 'walking' do not thus combine. Neither, therefore, if these three form the subject of an affirmation, nor if they form its predicate, is there any unity about that 20 affirmation. In both cases the unity is linguistic, but not real.

¹ Aristotle has in mind the case where the inversion is purely rhetorical, 'man' remaining grammatical subject.

² Cf. 17^b 38.

³ Aristotle really begs the question here, when he states that 'white is not man' is the denial of 'man is white'. Pacius explains that 'man is not white' and 'man is white' are in exactly the same relation each to each as 'white is not man' and 'man is white', and that therefore 'white is not man' and 'man is not white' are identical. This seems fair, but is in itself sufficient to prove the point at issue at once. The argument of the whole, therefore, is unnecessarily complicated.

If therefore the dialectical question is a request for an answer, i.e. either for the admission of a premiss or for the admission of one of two contradictories—and the premiss is itself always one of two contradictories—the answer to such a question as contains the above predicates cannot be a single
 25 proposition.¹ For as I have explained in the *Topics*,² the question is not a single one, even if the answer asked for is true.

At the same time it is plain that a question of the form 'what is it?' is not a dialectical question, for a dialectical questioner must by the form of his question give his opponent the chance of announcing one of two alternatives, whichever he wishes. He must therefore put the question into a more
 30 definite form, and inquire, e.g., whether man has such and such a characteristic or not.

Some combinations of predicates are such that the separate predicates unite to form a single predicate. Let us consider under what conditions this is and is not possible. We may either state in two separate propositions that man is an animal and that man is a biped, or we may combine the two, and state that man is an animal with two feet. Similarly we may use 'man' and 'white' as separate predicates, or
 35 unite them into one. Yet if a man is a shoemaker and is also good, we cannot construct a composite proposition and say that he is a good shoemaker. For if, whenever two separate predicates truly belong to a subject, it follows that the predicate resulting from their combination also truly belongs to the subject, many absurd results ensue. For instance, a man is man and white. Therefore, if predicates may always be combined, he is a white man. Again, if the predicate 'white' belongs to him, then the combination of that predicate with the former composite predicate will be permissible. Thus it will be right to say that he is a

¹ Aristotle has shown that the affirmation which contains more than one predicate is not single: he here proves the same about the dialectical question of the same type, and its answer. Incidentally he refutes the argument that the reason why the question and answer are not single lies in the fact that the question is alternative in form, pointing out that a dialectical question is always implicitly alternative even if the second part is not expressed.

² *Topica*, viii. 7; *Soph. El.* 169^a 6, 175^b 39 sqq., 181^a 36 sqq.

white white man and so on indefinitely. Or, again, we may 40 combine the predicates 'musical', 'white', and 'walking', and these may be combined many times.¹ Similarly we 21^a may say that Socrates is Socrates and a man, and that therefore he is the man Socrates, or that Socrates is a man and a biped, and that therefore he is a two-footed man.² Thus it is manifest that if a man states unconditionally that 5 predicates can always be combined, many absurd consequences ensue.

We will now explain what ought to be laid down.

Those predicates, and terms forming the subject of predication, which are accidental either to the same subject or to one another, do not combine to form a unity. Take 10 the proposition 'man is white of complexion and musical'. Whiteness and being musical do not coalesce to form a unity, for they belong only accidentally to the same subject. Nor yet, if it were true to say that that which is white is musical, would the terms 'musical' and 'white' form a unity, for it is only incidentally that that which is musical is white; the combination of the two will, therefore, not form a unity.

Thus, again, whereas, if a man is both good and a shoemaker, we cannot combine the two propositions and say simply that he is a good shoemaker,³ we are, at the same time, able to combine the predicates 'animal' and 'biped' and say that a man is an animal with two feet, for these 15 predicates are not accidental.

Those predicates, again, cannot form a unity, of which the one is implicit in the other: thus we cannot combine the predicate 'white' again and again with that which already contains the notion 'white', nor is it right to call a man an animal-man or a two-footed man; for the notions 'animal' and 'biped' are implicit in the word 'man'. On the other hand, it is possible to predicate a term simply of

¹ Omit *eis ἀνθρωπον* in l. 2 with B, C, Amm., and Waitz.

² 21^a 3, 4. The reading of A, B, Amm.: i.e. *ἐτι εἰ ὁ Σωκράτης Σωκράτης καὶ ἄνθρωπος, καὶ Σωκράτης ἄνθρωπος· καὶ εἰ ἄνθρωπος καὶ δίπους, καὶ ἄνθρωπος δίπους*, is here chosen, since that of C, which Bekker adopts, does not seem to give any satisfactory sense, and is not intrinsically more likely to be correct.

³ Omit *ὁ* in l. 14 with C.

any one instance, and to say that some one particular man
 30 is a man or that some one white man is a white man.

Yet this is not always possible: indeed, when in the adjunct there is some opposite which involves a contradiction, the predication of the simple term is impossible. Thus it is not right to call a dead man a man. When, however, this is not the case, it is not impossible.

Yet the facts of the case might rather be stated thus: when some such opposite elements are present, resolution is
 35 never possible, but when they are not present, resolution is nevertheless not always possible. Take the proposition 'Homer is so-and-so', say 'a poet'; does it follow that Homer is, or does it not? The verb 'is' is here used of Homer only incidentally, the proposition being that Homer is a poet, not that he is, in the independent sense of the word.

Thus, in the case of those predications which have within
 30 them no contradiction when the nouns are expanded into definitions, and wherein the predicates belong to the subject¹ in their own proper sense and not in any indirect way, the individual may be the subject of the simple propositions as well as of the composite. But in the case of that which is not, it is not true to say that because it is the object of opinion, it is; for the opinion held about it is that it is not, not that it is.

As these distinctions have been made, we must consider 12
 35 the mutual relation of those affirmations and denials which assert or deny possibility or contingency, impossibility or necessity: for the subject is not without difficulty.

We admit that of composite expressions those are contradictory each to each which have the verb 'to be' in its positive and negative form respectively. Thus the contradictory of the proposition 'man is' is 'man is not',
 21^b not 'not-man is', and the contradictory of 'man is white' is 'man is not white', not 'man is not-white'. For otherwise, since either the positive or the negative proposition is true of any subject, it will turn out true to say that a piece of wood is a man that is not white.²

¹ Reading *κατηγορεῖται* in l. 30.

² It is plain that if two propositions are contradictory, either one or

Now if this is the case, in those propositions which do 5 not contain the verb 'to be' the verb which takes its place will exercise the same function. Thus the contradictory of 'man walks' is 'man does not walk', not 'not-man walks'; for to say 'man walks' is merely equivalent to saying 'man is walking'.

If then this rule is universal, the contradictory of 'it may 10 be' is 'it may *not* be', not 'it cannot be'.¹

Now it appears that the same thing both may and may not be; for instance, everything that may be cut or may walk may also escape cutting and refrain from walking; and the reason is that those things that have potentiality in this sense are not always actual. In such cases, both the positive 15 and the negative propositions will be true; for that which is capable of walking or of being seen has also a potentiality in the opposite direction.

But since it is impossible that contradictory propositions should both be true of the same subject, it follows that 'it may *not* be' is not the contradictory of 'it may be'. For it is a logical consequence of what we have said, either that the same predicate can be both applicable and inapplicable to one and the same subject at the same time, or that it is 20 not by the addition of the verbs 'be' and 'not be', respectively, that positive and negative propositions are formed. If the former of these alternatives must be rejected, we must choose the latter.

The contradictory, then, of 'it may be' is 'it cannot be'. The same rule applies to the proposition 'it is contingent that it should be'; the contradictory of this is 'it is not contingent that it should be'. The similar propositions, 25 such as 'it is necessary' and 'it is impossible', may be dealt with in the same manner. For it comes about that just as in the former instances the verbs 'is' and 'is not' were added to the subject-matter of the sentence 'white' and 'man', so here 'that it should be' and 'that it should not be' the other predicate must belong to any subject. Thus, since the proposition 'a piece of wood is a white man' is not true, the contradictory of this proposition must be true.

¹ εἰ . . . δυνατόν εἶναι * 38-^b 12 forms one sentence, εἰ . . . ἀνθρώπου ^b 3-5 and οὐδὲν . . . βαδίζοντα εἶναι ^b 9, 10 being parentheses within it. So Bonitz.

30 are the subject-matter and 'is possible', 'is contingent', are added. These indicate that a certain thing is or is not possible, just as in the former instances 'is' and 'is not' indicated that certain things were or were not the case.¹

The contradictory, then, of 'it may *not* be' is not 'it cannot be', but 'it cannot not be', and the contradictory of 'it may be' is not 'it may *not* be', but 'it cannot be'.
 35 Thus the propositions 'it may be' and 'it may *not* be' appear each to imply the other: for, since these two propositions are not contradictory, the same thing both may and may *not* be. But the propositions 'it may be' and 'it cannot be' can never be true of the same subject at the same time,
 22^a for they are contradictory. Nor can the propositions 'it may not be' and 'it cannot not be' be at once true of the same subject.

The propositions which have to do with necessity are governed by the same principle. The contradictory of 'it is necessary that it should be' is not 'it is necessary that it should not be', but 'it is not necessary that it should be',
 5 and the contradictory of 'it is necessary that it should not be' is 'it is not necessary that it should not be'.

Again, the contradictory of 'it is impossible that it should be' is not 'it is impossible that it should not be' but 'it is not impossible that it should be', and the contradictory of 'it is impossible that it should not be' is 'it is not impossible that it should not be'.

To generalize, we must, as has been stated, define the clauses 'that it should be' and 'that it should not be' as the subject-matter of the propositions, and in making these terms²
 10 into affirmations and denials we must combine them with 'that it should be' and 'that it should not be' respectively.

We must consider the following pairs as contradictory propositions:

| | |
|-------------------|-----------------------|
| It may be. | It cannot be. |
| It is contingent. | It is not contingent. |
| It is impossible. | It is not impossible. |
| It is necessary. | It is not necessary. |
| It is true. | It is not true. |

¹ Omit the comma in l. 31 with Maier.

² *sc.* possible, contingent, impossible, necessary.

- 13 Logical sequences follow in due course when we have arranged the propositions thus. From the proposition 'it may be'¹ it follows that it is contingent, and the relation is reciprocal. It follows also that it is not impossible and not necessary.

From the proposition 'it may *not* be' or 'it is contingent that it should not be' it follows that it is not necessary that it should not be and that it is not impossible that it should not be. From the proposition 'it cannot be' or 'it is not contingent' it follows that it is necessary that it should not be and that it is impossible that it should be. From the 20 proposition 'it cannot not be' or 'it is not contingent that it should not be' it follows that it is necessary that it should be and that it is impossible that it should not be.

Let us consider these statements by the help of a table:

| | |
|---|---|
| A. It may be. | B. It cannot be. |
| It is contingent. | It is not contingent. 25 |
| It is not impossible that it should be. | It is impossible that it should be. |
| It is not necessary that it should be. | It is necessary that it should not be. ² |
| C. It may not be. | D. It cannot not be. |
| It is contingent that it should not be. | It is not contingent that it should not be. |
| It is not impossible that it should not be. | It is impossible that it 30 should not be. |
| It is not necessary that it should not be. | It is necessary that it should be. |

Now the propositions 'it is impossible that it should be' and 'it is not impossible that it should be' are consequent upon the propositions 'it may be', 'it is contingent', and 'it cannot be', 'it is not contingent', the contradictories upon the contradictories. But there is inversion. The negative

¹ Read *δυνατόν* in ^a 15, 17, 19, 20, 34, 36, ^b 18, 24, and *ἐνδεχόμενον* in ^a 17, 19, 21, with A, B, and, in most cases, C.

² Aristotle here gives the wrong denial to *οὐκ ἀναγκαῖον εἶναι*. Pacius explains that he is here following former logicians, in order to expose their false reasoning. In 22^b 10 he points out the flaw and in 22^b 22 gives the correct table, exchanging the position of *οὐκ ἀναγκαῖον εἶναι* and *οὐκ ἀναγκαῖον μὴ εἶναι*.

of the proposition 'it is impossible' is consequent upon the
 35 proposition 'it may be' and the corresponding positive in
 the first case upon the negative in the second. For 'it is
 impossible' is a positive proposition and 'it is not impos-
 sible' is negative.

- We must investigate the relation subsisting between these
 propositions and those which predicate necessity. That
 there is a distinction is clear. In this case, contrary proposi-
 tions follow respectively from contradictory propositions,
 and the contradictory propositions belong to separate
 sequences. For the proposition 'it is not necessary that
 22^b it should be' is not the negative of 'it is necessary that it
 should not be', for both these propositions may be true of
 the same subject; for when it is necessary that a thing should
 not be, it is not necessary that it should be. The reason
 why the propositions predicating necessity do not follow in
 the same kind of sequence as the rest, lies in the fact that
 the proposition 'it is impossible' is equivalent, when used
 with a contrary subject, to the proposition 'it is necessary'.
 5 For when it is impossible that a thing should be, it is
 necessary, not that it should be, but that it should not be,
 and when it is impossible that a thing should not be, it is
 necessary that it should be. Thus, if the propositions
 predicating impossibility or non-impossibility follow with-
 out change of subject from those predicating possibility or
 non-possibility, those predicating necessity must follow with
 the contrary subject; for the propositions 'it is impossible'
 and 'it is necessary' are not equivalent, but, as has been
 said, inversely connected.
- 10 Yet perhaps it is impossible that the contradictory pro-
 positions predicating necessity should be thus arranged.
 For when it is necessary that a thing should be, it is possible
 that it should be. (For if not, the opposite follows, since
 one or the other must follow; so, if it is not possible, it is
 impossible, and it is thus impossible that a thing should be,
 which must necessarily be; which is absurd.)
- . Yet from the proposition 'it may be' it follows that it is
 15 not impossible, and from that it follows that it is not neces-
 sary; it comes about therefore that the thing which must

necessarily be need not be; which is absurd. But again, the proposition 'it is necessary that it should be' does not follow from the proposition 'it may be', nor does the proposition 'it is necessary that it should not be'. For the proposition 'it may be' implies a twofold possibility, while, if either of the two former propositions is true, the twofold possibility vanishes. For if a thing may be, it may also not ²⁰ be, but if it is necessary that it should be or that it should not be, one of the two alternatives will be excluded. It remains, therefore, that the proposition 'it is not necessary that it should not be' follows from the proposition 'it may be'. For this is true also of that which must necessarily be.

Moreover the proposition 'it is not necessary that it should not be' is the contradictory of that which follows from the proposition 'it cannot be'; for 'it cannot be' ²⁵ is followed by 'it is impossible that it should be' and by 'it is necessary that it should not be', and the contradictory of this is the proposition 'it is not necessary that it should not be'. Thus in this case also contradictory propositions follow contradictory in the way indicated, and no logical impossibilities occur when they are thus arranged.

It may be questioned whether the proposition 'it may be' follows from the proposition 'it is necessary that it should be'. If not, the contradictory must follow, namely that it ³⁰ cannot be, or, if a man should maintain that this is not the contradictory, then the proposition 'it may not be'.

Now both of these are false of that which necessarily is. At the same time, it is thought that if a thing may be cut it may also not be cut, if a thing may be it may also not be, and thus it would follow that a thing which must necessarily be may possibly not be; which is false. It is ³⁵ evident, then, that it is not always the case that that which may be or may walk possesses also a potentiality in the other direction. There are exceptions. In the first place we must except those things which possess a potentiality not in accordance with a rational principle, as fire possesses the potentiality of giving out heat, that is, an irrational capacity. Those potentialities which involve a

rational principle are potentialities of more than one result,
 23^a that is, of contrary results; those that are irrational are not
 always thus constituted. As I have said, fire cannot both
 heat and not heat, neither has anything that is always
 actual any twofold potentiality. Yet some¹ even of those
 potentialities which are irrational admit of opposite results.
 5 However, thus much has been said to emphasize the truth
 that it is not every potentiality which admits of opposite
 results, even where the word is used always in the same
 sense.

But in some cases the word is used equivocally. For the
 term 'possible' is ambiguous, being used in the one case
 with reference to facts, to that which is actualized, as when
 a man is said to find walking possible because he is actually
 walking, and generally when a capacity is predicated
 10 because it is actually realized: in the other case, with
 reference to a state in which realization is conditionally
 practicable, as when a man is said to find walking possible
 because under certain conditions he would walk. This last
 sort of potentiality belongs only to that which can be in
 motion, the former can exist also in the case of that which
 has not this power. Both of that which is walking and is
 actual, and of that which has the capacity though not
 necessarily realized, it is true to say that it is not impossible
 that it should walk (or, in the other case, that it should be),
 15 but while we cannot predicate this latter kind of potentiality
 of that which is necessary in the unqualified sense of the
 word, we can predicate the former.

Our conclusion, then, is this: that since the universal is
 consequent upon the particular, that which is necessary
 is also possible, though not in every sense in which the
 word may be used.²

We may perhaps state that necessity and its absence are

¹ Aristotle alludes to the twofold potentiality possessed by inanimate things, in virtue of which they may be either affected or not affected, as, e.g., a cloak may be either cut or not cut.

² Just as, if the species may be predicated of a certain thing, the genus or universal may also be predicated, so, if necessity is predicated of an event, possibility may also be predicated, provided that sense of the word which includes the negative possibility be rejected.

the initial principles of existence and non-existence, and that all else must be regarded as posterior to these. 20

It is plain from what has been said that that which is of necessity is actual. Thus, if that which is eternal is prior, actuality also is prior to potentiality.¹ Some things are actualities without potentiality, namely, the primary substances; ² a second class consists of those things which are actual but also potential, whose actuality is in nature prior to their potentiality, though posterior in time; ³ a third 25 class comprises those things which are never actualized, but are pure potentialities.⁴

- 14 The question arises whether an affirmation finds its contrary in a denial or in another affirmation; whether the proposition 'every man is just' finds its contrary in the proposition 'no man is just', or in the proposition 'every man is unjust'. Take the propositions 'Callias is just', 'Callias 30 is not just', 'Callias is unjust'; we have to discover which of these form contraries.

Now if the spoken word corresponds with the judgement of the mind, and if, in thought, that judgement is the contrary of another, which pronounces a contrary fact, in the way, for instance, in which the judgement 'every man is just' pronounces a contrary to that pronounced by the judgement 'every man is unjust', the same must needs hold 35 good with regard to spoken affirmations.

But if, in thought, it is not the judgement which pronounces a contrary fact that is the contrary of another, then one affirmation will not find its contrary in another, but rather in the corresponding denial. We must therefore consider which true judgement is the contrary of the false, that which forms the denial of the false judgement or that which affirms the contrary fact.

¹ The argument is this: the necessary is actual,
the necessary is also a first principle, i.e. eternal,
that which is eternal is prior,
∴ the actual is prior to the potential.

² i.e. God and the intelligences that move the heavenly bodies.
Cf. *Met.* A. 6 and *Θ.* 1050^b 3-19.

³ i.e. τὰ φθαρτά. Cf. *Met.* *Θ.* 1049^b 10-1050^a 23.

⁴ Aristotle means such things as a maximal number, a minimal magnitude, or a void; cf. *Met.* *Θ.* 1048^b 9-17.

40 Let me illustrate. There is a true judgement concerning that which is good, that it is good; another, a false judgement, that it is not good; and a third, which is distinct,
 23^b that it is bad. Which of these two is contrary to the true? And if they are one and the same, which mode of expression forms the contrary?

It is an error to suppose that judgements are to be defined as contrary in virtue of the fact that they have contrary subjects; for the judgement concerning a good thing, that it is good, and that concerning a bad thing, that it is bad,
 5 may be one and the same, and whether they are so or not, they both represent the truth. Yet the subjects here are contrary. But judgements are not contrary because they have contrary subjects, but because they are to the contrary effect.

Now if we take the judgement that that which is good is good, and another that it is not good, and if there are at the same time other attributes, which do not and cannot belong to the good, we must nevertheless refuse to treat as the contraries of the true judgement those which opine that some other attribute subsists which does not subsist,
 10 as also those that opine that some other attribute does not subsist which does subsist, for both these classes of judgement are of unlimited content.¹

Those judgements must rather be termed contrary to the true judgements, in which error is present. Now these judgements are those which are concerned with the starting points of generation, and generation is the passing from one extreme to its opposite;² therefore error is a like transition.
 15 Now that which is good is both good and not bad. The first quality is part of its essence, the second accidental; for it is by accident that it is not bad. But if that true judgement is most really true, which concerns the subject's intrinsic nature, then that false judgement likewise is most really false, which concerns its intrinsic nature. Now the judgement that that which is good is not good is a false judgement concerning its intrinsic nature, the judgement

¹ *sc.* whereas there can be only one contrary.

² For this sense of the word ἀντικείμενον cf. *Met. Δ.* 10.

that it is bad is one concerning that which is accidental. Thus the judgement which denies the truth of the true²⁰ judgement is more really false than that which positively asserts the presence of the contrary quality. But it is the man who forms that judgement which is contrary to the true who is most thoroughly deceived, for contraries are among the things which differ most widely within the same class.¹ If then of the two judgements one is contrary to the true judgement, but that which is contradictory is the more truly contrary, then the latter, it seems, is the real contrary.² The judgement that that which is good is bad is composite.²⁵ For presumably the man who forms that judgement must at the same time understand that that which is good is not good.

Further, the contradictory is either always the contrary or never; therefore, if it must necessarily be so in all other cases, our conclusion in the case just dealt with would seem to be correct. Now where terms have no contrary, that³⁰ judgement is false, which forms the negative of the true; for instance, he who thinks a man is not a man forms a false judgement. If then in these cases the negative is the contrary, then the principle is universal in its application.

Again, the judgement that that which is not good is not good is parallel with the judgement that that which is good is good. Besides these there is the judgement that that which is good is not good, parallel with the judgement that that which is not good is good. Let us consider,³⁵ therefore, what would form the contrary of the true judgement that that which is not good is not good. The judgement that it is bad would, of course, fail to meet the case, since two true judgements are never contrary and this judgement might be true at the same time as that with

¹ Cf. *Cat.* 6^a 17.

² The argument of this passage is, shortly, this:

Error consists in the transition in thought from one judgement to its opposite extreme.

The idea 'not good' is further removed from 'good' than the idea 'bad'. ∴ complete error consists in the transition from the judgement that that which is good is good to the judgement that it is not good.

But (repeating the statement *οὐδὲμίαν θετίον . . . ἀλλ' ἐν ὅσῃς ἐστὶν ἡ ἀπάτη*) it is the man who holds the contrary judgement to the true who suffers most completely from error.

∴ 'not good' is the contrary of 'good'.

which it is connected. For since some things which are not good are bad, both judgements may be true. Nor is the judgement that it is not bad the contrary, for this too might be true, since both qualities might be predicated of the same
 40 subject. It remains, therefore, that of the judgement concerning that which is not good, that it is not good, the
 24^a contrary judgement is that it is good; for this is false. In the same way, moreover, the judgement concerning that which is good, that it is not good, is the contrary of the judgement that it is good.

It is evident that it will make no difference if we universalize the positive judgement, for the universal negative
 5 judgement will form the contrary. For instance, the contrary of the judgement that everything that is good is good is that nothing that is good is good. For the judgement that that which is good is good, if the subject be understood in a universal sense, is equivalent to the judgement that whatever¹ is good is good, and this is identical with the judgement that everything that is good is good. We may deal similarly with judgements concerning that which is not good.

24^b If therefore this is the rule with judgements, and if spoken affirmations and denials are judgements expressed in words, it is plain that the universal denial is the contrary of the affirmation about the same subject. Thus the propositions 'everything good is good', 'every man is good', have for their contraries the propositions 'nothing
 5 good is good', 'no man is good'. The contradictory propositions, on the other hand, are 'not everything good is good', 'not every man is good'.

It is evident, also, that neither true judgements nor true propositions² can be contrary the one to the other. For whereas, when two propositions are true, a man may state both at the same time without inconsistency, contrary propositions are those which state contrary conditions, and contrary conditions cannot subsist at one and the same time in the same subject.

ANALYTICA PRIORA

BY

A. J. JENKINSON, M.A.

FELLOW AND TUTOR OF BRASENOSE COLLEGE

PREFACE

THIS translation is based upon the text of Bekker. The notes show where I have deviated from it. I have obtained much help from the translation and commentary of Pacius, and especially with regard to the text from the edition of the *Organon* by Waitz. But my greatest obligations are due to Mr. W. D. Ross, who has placed his knowledge of Aristotle's thought and language so freely at my disposal that any merit which this work may have belongs to him rather than to me.

ANALYTICA PRIORA

BOOK I

WE must first state the subject of our inquiry and the ^{24^a} 10
faculty to which it belongs: its subject is demonstration
and the faculty that carries it out demonstrative science.
We must next define a premiss, a term, and a syllogism,
and the nature of a perfect and of an imperfect syllogism;
and after that, the inclusion or non-inclusion of one term in
another as in a whole, and what we mean by predicating
one term of all, or none, of another. ¹⁵

A premiss then is a sentence affirming or denying one
thing of another. This is either universal or particular or
indefinite. By universal I mean the statement that some-
thing belongs to all or none of something else; by particular
that it belongs to some or not to some or not to all; by
indefinite that it does or does not belong, without any mark
to show whether it is universal or particular, e.g. 'contraries ²⁰
are subjects of the same science', or 'pleasure is not good'.
The demonstrative premiss differs from the dialectical,
because the demonstrative premiss is the assertion of one of
two contradictory statements (the demonstrator does not
ask for his premiss, but lays it down), whereas the dialectical
premiss depends on the adversary's choice between two ²⁵
contradictories. But this will make no difference to the
production of a syllogism in either case; for both the
demonstrator and the dialectician argue syllogistically after
stating that something does or does not belong to some-
thing else. Therefore a syllogistic premiss without qualifica-
tion will be an affirmation or denial of something concerning
something else in the way we have described; it will be
demonstrative, if it is true and obtained through the first. ³⁰
principles of its science; while a dialectical premiss is the
giving of a choice between two contradictories, when a man
is proceeding by question, but when he is syllogizing it

is the assertion of that which is apparent and generally admitted, as has been said in the *Topics*.¹ The nature then of a premiss and the difference between syllogistic, demonstrative, and dialectical premisses, may be taken as sufficiently
 15 defined by us in relation to our present need, but will be stated accurately in the sequel.²

I call that a term into which the premiss is resolved, i.e. both the predicate and that of which it is predicated, 'being' being added and 'not being' removed, or vice versa.

A syllogism is discourse in which, certain things being stated, something other than what is stated follows of
 20 necessity from their being so. I mean by the last phrase that they produce the consequence, and by this, that no further term is required from without in order to make the consequence necessary.

I call that a perfect syllogism which needs nothing other than what has been stated to make plain what necessarily follows; a syllogism is imperfect, if it needs either one or
 25 more propositions, which are indeed the necessary consequences of the terms set down, but have not been expressly stated as premisses.

That one term should be included in another as in a whole is the same as for the other to be predicated of all of the first. And we say that one term is predicated of all of another, whenever no instance of the subject can be found of which the other term cannot be asserted: 'to be predi-
 30 cated of none' must be understood in the same way.

25^a Every premiss states that something either is or must be 2 or may be the attribute of something else; of premisses of these three kinds some are affirmative, others negative, in respect of each of the three modes of attribution; again some affirmative and negative premisses are universal, 5 others particular, others indefinite. It is necessary then that in universal attribution the terms of the negative premiss should be convertible, e.g. if no pleasure is good, then no good will be pleasure; the terms of the affirmative

¹ 100^a 29, 104^a 8.

² The nature of demonstrative premisses is discussed in the *Post. An.*; that of dialectical premisses in the *Topics*.

must be convertible, not however universally, but in part, e.g. if every pleasure is good, some good must be pleasure; the particular affirmative must convert in part (for if some pleasure is good, then some good will be pleasure); but the particular negative need not convert, for if some animal is not man, it does not follow that some man is not animal.

First then take a universal negative with the terms *A* and *B*. If no *B* is *A*, neither can any *A* be *B*. For if 15 some *A* (say *C*) were *B*, it would not be true that no *B* is *A*; for *C* is a *B*. But if every *B* is *A*, then some *A* is *B*. For if no *A* were *B*, then no *B* could be *A*. But we assumed that every *B* is *A*. Similarly too, if the premiss 20 is particular. For if some *B* is *A*, then some of the *As* must be *B*. For if none were, then no *B* would be *A*. But if some *B* is not *A*, there is no necessity that some of the *As* should not be *B*; e.g. let *B* stand for animal and *A* for man. Not every animal is a man; but every 25 man is an animal.

- 3 The same manner of conversion will hold good also in respect of necessary premisses. The universal negative converts universally; each of the affirmatives converts into a particular. If it is necessary that no *B* is *A*, it is necessary 30 also that no *A* is *B*. For if it is possible that some *A* is *B*, it would be possible also that some *B* is *A*. If all or some *B* is *A* of necessity, it is necessary also that some *A* is *B*: for if there were no necessity, neither would some of the *Bs* be *A* necessarily. But the particular negative does not convert, 35 for the same reason which we have already stated.¹

In respect of possible premisses, since possibility is used in several senses (for we say that what is necessary and what is not necessary and what is potential is possible), affirmative statements will all convert in a manner similar to those 40 described.² For if it is possible that all or some *B* is *A*, it will be possible that some *A* is *B*. For if that were not 25^b possible, then no *B* could possibly be *A*. This has been already proved.³ But in negative statements the case is different. Whatever is said to be possible, either because *B*

¹ Il. 12, 22-6.

² In Il. 7-13.

³ A 20-2.

necessarily is *A*,¹ or because *B* is not necessarily *A*, admits
 5 of conversion like other negative statements, e. g. if one
 should say, it is possible that man is not horse, or that no
 garment is white. For in the former case the one term
 necessarily does not belong to the other: in the latter there
 is no necessity that it should: and the premiss converts like
 other negative statements. For if it is possible for no man
 10 to be a horse, it is also admissible for no horse to be a man;
 and if it is admissible for no garment to be white, it is also
 admissible for nothing white to be a garment. For if any
 white thing must be a garment, then some garment will
 necessarily be white. This has been already proved.² The
 particular negative also must be treated like those dealt
 with above.³ But if anything is said to be possible because
 15 it is the general rule and natural (and it is in this way we
 define the possible), the negative premisses can no longer
 be converted like the simple negatives; the universal nega-
 tive premiss does not convert, and the particular does. This
 will be plain when we speak about the possible.⁴ At present
 we may take this much as clear in addition to what has been
 20 said: the statement that it is possible that no *B* is *A* or
 some *B* is not *A* is affirmative in form: for the expression
 'is possible' ranks along with 'is', and 'is' makes an affirma-
 tion always and in every case, whatever the terms to which
 it is added in predication, e. g. 'it is not-good' or 'it is not-
 white' or in a word 'it is not-this'. But this also will be
 25 proved in the sequel.⁵ In conversion these premisses will
 behave like the other affirmative propositions.

After these distinctions we now state by what means, 4
 when, and how every syllogism is produced; subsequently⁶
 we must speak of demonstration. Syllogism should be
 discussed before demonstration, because syllogism is the
 30 more general: the demonstration is a sort of syllogism,
 but not every syllogism is a demonstration.

Whenever three terms are so related to one another that
 the last is contained in the middle as in a whole, and the

³ In the *Posterior Analytics*.

⁴ cc. 13, 17.

⁵ ^a 14-17.

⁶ c. 46.

middle is either contained in, or excluded from, the first as in or from a whole, the extremes must be related by a perfect syllogism. I call that term middle which is itself contained in another and contains another in itself: in position also this comes in the middle. By extremes I mean both that term which is itself contained in another and that in which another is contained. If¹ *A* is predicated of all *B*, and *B* of all *C*, *A* must be predicated of all *C*: we have already explained² what we mean by 'predicated of all'. Similarly³ also, if *A* is predicated of no *B*, and *B* of all *C*, it is necessary that no *C* will be *A*. 35

But⁴ if the first term belongs to all the middle, but the middle to none of the last term, there will be no syllogism in respect of the extremes; for nothing necessary follows from the terms being so related; for it is possible that the first should belong either to all or to none of the last, so that neither a particular nor a universal conclusion is necessary. But if there is no necessary consequence, there cannot be a syllogism by means of these premisses. As an example of a universal affirmative relation between the extremes we may take the terms animal, man, horse; of a universal negative relation, the terms animal, man, stone. Nor⁵ again can a syllogism be formed when neither the first term belongs to any of the middle, nor the middle to any of the last. As an example of a positive relation between the extremes take the terms science, line, medicine: of a negative relation science, line, unit. 40

If then the terms are universally related, it is clear in this figure when a syllogism will be possible and when not, and that if a syllogism is possible the terms must be related as described, and if they are so related there will be a syllogism. 45

But if one term is related universally, the other in part only, to its subject, there must be a perfect syllogism whenever universality is posited with reference to the major term either affirmatively or negatively, and particularity with reference to the minor term affirmatively: but whenever 50

¹ Barbara, major *A*, minor *A*.

³ Celarent, major *E*, minor *A*.

⁵ Major *E*, minor *E*.

² 24^b 28.

⁴ Major *A*, minor *E*.

the universality is posited in relation to the minor term, or the terms are related in any other way, a syllogism is impossible. I call that term the major in which the middle is contained and that term the minor which comes under the middle. Let ¹ all *B* be *A* and some *C* be *B*. Then if 'predicated of all' means what was said above,² it is necessary
 25 that some *C* is *A*. And ³ if no *B* is *A*, but some *C* is *B*, it is necessary that some *C* is not *A*. (The meaning of 'predicated of none' has also been defined.⁴) So there will be a perfect syllogism. This holds good also if the premiss *BC*⁵ should be indefinite, provided that it is affirmative: for we shall have the same syllogism whether the premiss is indefinite or particular.

30 But if the universality is posited with respect to the minor term either affirmatively or negatively, a syllogism will not be possible, whether the major premiss is positive or negative, indefinite or particular: e.g.⁶ if some *B* is or is not *A*, and all *C* is *B*. As an example of a positive relation between
 35 the extremes take the terms good, state, wisdom: of a negative relation, good, state, ignorance. Again ⁷ if no *C* is *B*, but some *B* is or is not *A*, or not every *B* is *A*, there cannot be a syllogism. Take the terms white, horse, swan: white, horse, raven. The same terms may be taken also if the premiss *BA* is indefinite.

26^b Nor when the major premiss is universal, whether affirmative or negative, and the minor premiss is negative and particular, can there be a syllogism, whether the minor premiss be indefinite or particular: e.g.⁸ if all *B* is *A*, and some *C* is not *B*, or if not all *C* is *B*. For the major term may be predicable both of all and of none of the minor,
 5 to some of which the middle term cannot be attributed. Suppose the terms are animal, man, white: next take some of the white things of which man is not predicated—swan

¹ Darii.² 24^b 28.³ Ferio.⁴ 24^b 30.

⁵ The Aristotelian formula for the proposition, *AB*, in which *B* represents the subject and *A* the predicate (*A* belongs to *B*), has been retained throughout, because in most places this suits the context better than the modern formula in which *A* represents the subject and *B* the predicate.

⁶ Major *I* or *O*, minor *A*.⁷ Major *I* or *O*, minor *E*.⁸ Major *A*, minor *O*.

and snow : animal is predicated of all of the one, but of none of the other. Consequently there cannot be a syllogism. Again¹ let no *B* be *A*, but let some *C* not be *B*. Take the 10 terms inanimate, man, white : then take some white things of which man is not predicated—swan and snow : the term inanimate is predicated of all of the one, of none of the other.

Further since it is indefinite to say some *C* is not *B*, and it is true that some *C* is not *B*, whether no *C* is *B*, or not all 15 *C* is *B*, and since if terms are assumed such that no *C* is *B*, no syllogism follows (this has already been stated²), it is clear that this arrangement of terms³ will not afford a syllogism : otherwise one would have been possible with a *universal* negative minor premiss. A similar proof may 20 also be given if the universal premiss⁴ is negative.⁵

Nor can there in any way be a syllogism if both the relations of subject and predicate are particular, either positively or negatively, or the one negative and the other affirmative,⁶ or one indefinite and the other definite, or both indefinite. Terms common to all the above are animal, white, horse : 25 animal, white, stone.

It is clear then from what has been said that if there is a syllogism in this figure with a particular conclusion, the terms must be related as we have stated : if they are related otherwise, no syllogism is possible anyhow. It is evident also that all the syllogisms in this figure are perfect (for they are all completed by means of the premisses originally 30 taken) and that all conclusions are proved by this figure, viz. universal and particular, affirmative and negative. Such a figure I call the first.

- 5 Whenever the same thing belongs to all of one subject, and to none of another, or to all of each subject or to none 35 of either, I call such a figure the second ; by middle term in it I mean that which is predicated of both subjects, by extremes the terms of which this is said, by major extreme that which lies near the middle, by minor that which is further away from the middle. The middle term

¹ Major *E*, minor *O*.

² * 2.

³ Major *A*, minor *O*.

⁴ i.e. the major premiss.

⁵ Major *E*, minor *O*.

⁶ *II*, *OO*, *IO*, *OI*.

27^a stands outside the extremes, and is first in position. A syllogism cannot be perfect anyhow in this figure, but it may be valid whether the terms are related universally or not.

If then the terms are related universally a syllogism will be possible, whenever the middle belongs to all of one subject and to none of another (it does not matter which has the negative relation), but in no other way. Let *M* be predicated of no *N*, but of all *O*. Since, then, the negative relation is convertible, *N* will belong to no *M*: but *M* was assumed to belong to all *O*: consequently *N* will belong to no *O*.¹ This has already been proved.² Again if *M* belongs to all *N*, but to no *O*, then *N* will belong to no *O*.³ For if *M* belongs to no *O*, *O* belongs to no *M*: but *M* (as was said) belongs to all *N*: *O* then will belong to no *N*: for the first figure has again been formed. But since the negative relation is convertible, *N* will belong to no *O*. Thus it will be the same syllogism that proves both conclusions.

15 It is possible to prove these results also by reduction *ad impossibile*.

It is clear then that a syllogism is formed when the terms are so related, but not a perfect syllogism: for necessity is not perfectly established merely from the original premisses; others also are needed.

But if *M* is predicated of every *N* and *O*, there cannot be a syllogism. Terms to illustrate a positive relation between the extremes are substance, animal, man; a negative relation, substance, animal, number—substance being the middle term.

Nor is a syllogism possible when *M* is predicated neither of any *N* nor of any *O*. Terms to illustrate a positive relation are line, animal, man: a negative relation, line, animal, stone.

It is clear then that if a syllogism is formed when the terms are universally related, the terms must be related as we stated at the outset:⁴ for if they are otherwise related no necessary consequence follows.

¹ Cesare.

² 25^b 40.

³ Camestres. Read *ὅτι τῶν τῶν τῶν* in l. 10 with A₂, Waitz, and perhaps Philoponus.

⁴ l. 3.

If the middle term is related universally to one of the extremes, a particular negative syllogism must result whenever the middle term is related universally to the major whether positively or negatively, and particularly to the minor and in a manner opposite to that of the universal statement: by 'an opposite manner' I mean, if the universal statement is negative, the particular is affirmative: 30 if the universal is affirmative, the particular is negative. For if *M* belongs to no *N*, but to some *O*, it is necessary that *N* does not belong to some *O*.¹ For since the negative statement is convertible, *N* will belong to no *M*: but *M* was admitted to belong to some *O*: therefore *N* will not belong to some *O*: 35 for the result is reached by means of the first figure. Again if *M* belongs to all *N*, but not to some *O*, it is necessary that *N* does not belong to some *O*:² for if *N* belongs to all *O*, and *M* is predicated also of all *N*, *M* must belong to all *O*: but we assumed that *M* does not belong to some 27^b *O*. And if *M* belongs to all *N* but not to all *O*, we shall conclude that *N* does not belong to all *O*: the proof is the same as the above. But if *M* is predicated of all *O*, but not of all *N*, there will be no syllogism. Take the terms animal, substance, raven; animal, white, raven. Nor will 5 there be a conclusion when *M* is predicated of no *O*, but of some *N*. Terms to illustrate a positive relation between the extremes are animal, substance, unit: a negative relation, animal, substance, science.

If then the universal statement is opposed to the particular, we have stated when a syllogism will be possible and when 10 not: but if the premisses are similar in form, I mean both negative or both affirmative, a syllogism will not be possible anyhow. First let them be negative, and let the major premiss be universal, e. g. let *M* belong to no *N*, and not to some *O*. It is possible then for *N* to belong either to all *O* or 15 to no *O*. Terms to illustrate the negative relation are black, snow, animal. But it is not possible to find terms of which the extremes are related positively and universally, if *M* belongs to some *O*, and does not belong to some *O*. For if *N* belonged to all *O*, but *M* to no *N*, then *M* would belong to

¹ Festino.² Baroco.

no *O* : but we assumed that it belongs to some *O*. In this
 20 way then it is not admissible to take terms : our point must
 be proved from the indefinite nature of the particular state-
 ment. For since it is true that *M* does not belong to some *O*,
 even if it belongs to no *O*, and since if it belongs to no *O*
 a syllogism is (as we have seen ¹) not possible, clearly it will
 not be possible now either.

Again let the premisses be affirmative, and let the major
 premiss as before be universal, e. g. let *M* belong to all *N*
 25 and to some *O*. It is possible then for *N* to belong to all
O or to no *O*. Terms to illustrate the negative relation
 are white, swan, stone. But it is not possible to take terms
 to illustrate the universal affirmative relation, for the reason
 already stated : ² the point must be proved from the indefinite
 nature of the particular statement. But if the *minor* pre-
 30 miss is universal, and *M* belongs to no *O*, and not to some
N, it is possible for *N* to belong either to all *O* or to no *O*.
 Terms for the positive relation are white, animal, raven : for
 the negative relation, white, stone, raven. If the premisses
 are affirmative, terms for the negative relation are white,
 animal, snow ; for the positive relation, white, animal, swan.
 Evidently then, whenever the premisses are similar in form,
 35 and one is universal, the other particular, a syllogism cannot
 be formed anyhow. Nor is one possible if the middle term
 belongs to some of each of the extremes, or does not belong
 to some of either, or belongs to some of the one, not to some
 of the other, or belongs to neither universally,³ or is related
 to them indefinitely. Common terms for all the above are
 white, animal, man : white, animal, inanimate.

28^a It is clear then from what has been said that if the terms
 are related to one another in the way stated, a syllogism
 results of necessity ; and if there is a syllogism, the terms
 must be so related. But it is evident also that all the
 syllogisms in this figure are imperfect : for all are made
 5 perfect by certain supplementary statements, which either
 are contained in the terms of necessity or are assumed as

¹ * 21.

² l. 18.

³ An alternative and clearer expression for 'does not belong to some of either'.

hypotheses, i. e. when we prove *per impossibile*. And it is evident that an affirmative conclusion is not attained by means of this figure, but all are negative, whether universal or particular.

- 6 But if one term belongs to all, and another to none, of a 10
third, or if both belong to all, or to none, of it, I call such a
figure the third; by middle term in it I mean that of which
both the predicates are predicated, by extremes I mean the
predicates, by the major extreme that which is further from
the middle, by the minor that which is nearer to it. The
middle term stands outside the extremes, and is last 15
in position. A syllogism cannot be perfect in this figure
either, but it may be valid whether the terms are related
universally or not to the middle term.

If they are universal, whenever both *P* and *R* belong to all
S, it follows that *P* will necessarily belong to some *R*.¹
For, since the affirmative statement is convertible, *S* will
belong to some *R*: consequently since *P* belongs to all *S*, 20
and *S* to some *R*, *P* must belong to some *R*: for a syllogism
in the first figure is produced. It is possible to demonstrate
this also *per impossibile* and by exposition. For if both *P*
and *R* belong to all *S*, should one of the *Ss*, e.g. *N*, be taken,
both *P* and *R* will belong to this, and thus *P* will belong to 25
some *R*.

If *R* belongs to all *S*, and *P* to no *S*, there will be
a syllogism to prove that *P* will necessarily not belong
to some *R*.² This may be demonstrated in the same way
as before by converting the premiss *RS*.³ It might be
proved also *per impossibile*, as in the former cases. But if 30
R belongs to no *S*, *P* to all *S*, there will be no syllogism.
Terms for the positive relation are animal, horse, man: for
the negative relation animal, inanimate, man.

Nor can there be a syllogism when both terms are asserted
of no *S*. Terms for the positive relation are animal, horse,
inanimate; for the negative relation man, horse, inanimate— 35
inanimate being the middle term.

It is clear then in this figure also when a syllogism will

¹ Darapti.

² Felapton.

³ See note 26^a 29.

be possible and when not, if the terms are related universally. For whenever both the terms are affirmative, there will be a syllogism to prove that one extreme belongs to some of the other; but when they are negative, no syllogism will
 28^b be possible. But when one is negative, the other affirmative, if the major is negative, the minor affirmative, there will be a syllogism to prove that the one extreme does not belong to some of the other: but if the relation is reversed, no syllogism will be possible.

5 If one term is related universally to the middle, the other in part only, when both are affirmative there must be a syllogism, no matter which of the premisses is universal. For if *R* belongs to all *S*, *P* to some *S*, *P* must belong to some *R*.¹ For since the affirmative statement is convertible
 10 *S* will belong to some *P*: consequently since *R* belongs to all *S*, and *S* to some *P*, *R* must also belong to some *P*: therefore *P* must belong to some *R*.

Again if *R* belongs to some *S*, and *P* to all *S*, *P* must belong to some *R*.² This may be demonstrated in the same way as the preceding. And it is possible to demonstrate it also *per impossibile* and by exposition, as in the former
 15 cases. But if one term is affirmative, the other negative, and if the affirmative is universal, a syllogism will be possible whenever the minor term is affirmative. For if *R* belongs to all *S*, but *P* does not belong to some *S*, it is necessary that *P* does not belong to some *R*.³ For if *P* belongs to all *R*, and *R* belongs to all *S*,⁴ then *P* will belong to all *S*:
 20 but we assumed that it did not. Proof is possible also without reduction *ad impossibile*, if one of the *S*s be taken to which *P* does not belong.

But whenever the major is affirmative, no syllogism will be possible, e.g. if *P* belongs to all *S*, and *R* does not belong to some *S*. Terms for the universal affirmative relation are animate, man, animal. For the universal negative relation
 25 it is not possible to get terms, if *R* belongs to some *S*, and does not belong to some *S*. For if *P* belongs to all *S*, and *R* to some *S*, then *P* will belong to some *R*: but we

¹ Disamis.³ Bocardo.² Datisi.⁴ Comma after Σ in l. 19.

assumed¹ that it belongs to no *R*. We must put the matter as before.² Since the expression 'it does not belong to some' is indefinite, it may be used truly of that also which belongs to none. But if *R* belongs to no *S*, no syllogism is³⁰ possible, as has been shown.³ Clearly then no syllogism will be possible here.

But if the negative term is universal, whenever the major is negative and the minor affirmative there will be a syllogism. For if *P* belongs to no *S*, and *R* belongs to some *S*, *P* will not belong to some *R*:⁴ for we shall have the first figure again, if the premiss *RS* is converted. 35

But when the minor is negative, there will be no-syllogism. Terms for the positive relation are animal, man, wild: for the negative relation, animal, science, wild—the middle in both being the term wild

Nor is a syllogism possible when both are stated in the negative, but one is universal, the other particular. When the *minor* is related universally to the middle, take the terms 29^a animal, science, wild; animal, man, wild. When the *major* is related universally to the middle, take as terms for a negative relation raven, snow, white. For a positive relation terms cannot be found, if *R* belongs to some *S*, and does not belong to some *S*. For if *P* belongs to all *R*, and *R* to some *S*, then *P* belongs to some *S*: but we assumed that it belongs to no *S*. Our point, then, must be proved from the indefinite nature of the particular statement.

Nor is a syllogism possible anyhow, if each of the extremes belongs to some of the middle, or does not belong, or one belongs and the other does not to some of the middle, or one belongs to some of the middle, the other not to all, or if the premisses are indefinite. Common terms for all are animal, man, white: animal, inanimate, white. 10

It is clear then in this figure also when a syllogism will be possible, and when not; and that if the terms are as stated, a syllogism results of necessity, and if there is a syllogism, the terms must be so related. It is clear also that all the

¹ i.e. in supposing the universal negative relation between the extremes.

² 27^b 20.

³ 28^a 30.

⁴ Ferison.

15 syllogisms in this figure are imperfect (for all are made perfect by certain supplementary assumptions), and that it will not be possible to reach a universal conclusion by means of this figure, whether negative or affirmative.

It is evident also that in all the figures, whenever a proper 7
 20 syllogism does not result, if both the terms are affirmative or negative nothing necessary follows at all, but if one is affirmative, the other negative, and if the negative is stated universally, a syllogism always results relating the minor¹ to the major term,² e. g. if *A* belongs to all or some *B*, and *B* belongs to no *C*: for if the premisses are converted
 25 it is necessary that *C* does not belong to some *A*.³ Similarly also in the other figures: a syllogism always results by means of conversion. It is evident also that the substitution of an indefinite for a particular affirmative will effect the same syllogism in all the figures.

30 It is clear too that all the imperfect syllogisms are made perfect by means of the first figure. For all are brought to a conclusion either ostensively or *per impossibile*. In both ways the first figure is formed: if they are made perfect ostensively, because (as we saw) all are brought to a conclusion by means of conversion, and conversion produces the
 35 first figure: if they are proved *per impossibile*, because on the assumption of the false statement the syllogism comes about by means of the first figure, e. g. in the last figure, if *A* and *B* belong to all *C*, it follows that *A* belongs to some *B*: for if *A* belonged to no *B*, and *B* belongs to all *C*, *A* would belong to no *C*: but (as we stated) it belongs to all *C*. Similarly also with the rest.

29^b It is possible also to reduce all syllogisms to the *universal* syllogisms in the first figure. Those in the second figure are clearly made perfect by these, though not all in the same way; the universal syllogisms are made perfect by converting the negative premiss, each of the particular syllogisms by reduction *ad impossibile*. In the first figure particular syllogisms are indeed made perfect by themselves, but it is possible also to prove them by means of the second figure,

¹ As predicate.² As subject.³ Fesapo, Fresison.

reducing them *ad impossibile*, e.g. if *A* belongs to all *B*, and *B* to some *C*, it follows that *A* belongs to some *C*. For if it belonged to no *C*, and belongs to all *B*, then *B* will belong to no *C*: this we know by means of the second figure. 10 Similarly also demonstration will be possible in the case of the negative. For if *A* belongs to no *B*, and *B* belongs to some *C*, *A* will not belong to some *C*: for if it belonged to all *C*, and belongs to no *B*, then *B* will belong to no *C*: and this (as we saw) is the middle figure. Consequently, since 15 all syllogisms in the middle figure can be reduced to universal syllogisms in the first figure, and since particular syllogisms in the first figure can be reduced to syllogisms in the middle figure, it is clear that particular syllogisms¹ can be reduced to universal syllogisms in the first figure. Syllogisms in the third figure, if the terms are universal, are directly made 20 perfect by means of those syllogisms;² but, when one of the premisses is particular, by means of the *particular* syllogisms in the first figure: and these (we have seen) may be reduced to the universal syllogisms in the first figure: consequently also the particular syllogisms in the third figure may be so reduced. It is clear then that all syllogisms may be reduced to the universal syllogisms in the first figure. 25

We have stated then how syllogisms which prove that something belongs or does not belong to something else are constituted, both how syllogisms of the same figure are constituted in themselves, and how syllogisms of different figures are related to one another.

- 8 Since there is a difference according as something belongs, necessarily belongs, or may belong to something else (for 30 many things belong indeed, but not necessarily, others neither necessarily nor indeed at all, but it is possible for them to belong), it is clear that there will be different syllogisms to prove each of these relations, and syllogisms with differently related terms, one syllogism concluding from what is necessary, another from what is, a third from what is possible. 35

There is hardly any difference between syllogisms from

¹ *sc.* in the first figure.

² *viz.* by reduction *per impossibile* to Celarent and Barbara.

necessary premisses and syllogisms from premisses which merely assert. When the terms are put in the same way, then, whether something belongs or necessarily belongs (or does not belong) to something else, a syllogism will or will not result alike in both cases, the only difference being the
 30^a addition of the expression 'necessarily' to the terms. For the negative statement is convertible alike in both cases, and we should give the same account of the expressions 'to be contained in something as in a whole' and 'to be predicated of all of something'. With the exceptions to be made below, the conclusion will be proved to be necessary
 5 by means of conversion, in the same manner as in the case of simple predication. But in the middle figure when the universal statement is affirmative, and the particular negative, and again in the third figure when the universal is affirmative and the particular negative, the demonstration will not take the same form, but it is necessary by the
 'exposition' of a part of the subject of the particular negative
 10 proposition, to which the predicate does not belong, to make the syllogism in reference to this: with terms so chosen the conclusion will necessarily follow. But if the relation is necessary in respect of the part taken, it must hold of some of that term in which this part is included: for the part taken is just some of that. And each of the resulting syllogisms is in the appropriate figure.¹

- ¹ Baroco. All *N* is necessarily *M*.
 Some *O* is necessarily not *M*.
 ∴ Some *O* is necessarily not *N*.
 Bocardo. Some *S* is necessarily not *P*.
 All *S* is necessarily *R*.
 ∴ Some *R* is necessarily not *P*.

When the propositions are assertoric, the conclusions are proved by reduction *ad impossibile*. The contradictory of 'Some *O* is necessarily not *N*' is 'Every *O* is possibly *N*'; but if this is combined with 'All *N* is necessarily *M*', the combination of an apodictic with a problematic premiss does not give an apodictic conclusion. Aristotle therefore falls back on another method of proof. If some *O* is necessarily not *M*, take some part of *O*—viz. *Q*—all of which is necessarily not *M*. Then

- It is necessary that all *N* be *M*.
 It is necessary that no *Q* be *M*.
 ∴ It is necessary that no *Q* be *N*.
 ∴ It is necessary that some *O* be not *N*.

Baroco is proved by means of Camestres; similarly Bocardo is proved by means of Felapton—each by a syllogism in the same figure

It happens sometimes also that when *one* premiss is 15
 necessary the conclusion is necessary, not however when
 either premiss is necessary, but only when the major is,
 e.g. if *A* is taken as necessarily belonging or not belonging
 to *B*, but *B* is taken as simply belonging to *C*: for if the
 premisses are taken in this way, *A* will necessarily belong 20
 or not belong to *C*. For since *A* necessarily belongs, or
 does not belong, to every *B*, and since *C* is one of the *B*s,
 it is clear that for *C*¹ also the positive or the negative rela-
 tion to *A* will hold necessarily. But if the major premiss
 is not necessary, but the minor is necessary, the conclusion
 will not be necessary. For if it were, it would result both 25
 through the first figure and through the third that *A* belongs
 necessarily to some *B*. But this is false; for *B* may be
 such that it is possible that *A* should belong to none of it.
 Further, an example also makes it clear that the conclusion
 will not be necessary, e.g. if *A* were movement, *B* animal, 30
C man: man is an animal necessarily, but an animal does
 not move necessarily, nor does man. Similarly also if the
 major premiss is negative; for the proof is the same.

In particular syllogisms, if the universal premiss is neces-
 sary, then the conclusion will be necessary; but if the par- 35
 ticular, the conclusion will not be necessary, whether the
 universal premiss is negative or affirmative. First let the
universal be necessary, and let *A* belong to all *B* necessarily,
 but let *B* simply belong to some *C*: it is necessary then that
A belongs to some *C* necessarily: for *C* falls under *B*, and 40
A was assumed to belong necessarily to all *B*. Similarly 30^b
 also if the syllogism should be negative: for the proof will
 be the same. But if the *particular* premiss is necessary, the
 conclusion will not be necessary: for from the denial of such
 a conclusion nothing impossible results,² just as it does not
 in the universal syllogisms. The same is true of negative 5
 syllogisms. Try the terms movement, animal, white.

In the *second* figure, if the negative premiss is necessary,
 then the conclusion will be necessary, but if the affirmative,
 as itself (l. 13). Camestres and Felapton can then by conversion be
 proved by means of Celarent and Ferio (ll. 3-5).

¹ Read ϕ Γ in l. 22 with A, B, C, Phil., and Waitz.

² i.e. from the assumption 'all *C* is possibly not *A*'. Cf. 36^a 22-5.

not necessary. First let the *negative* be necessary; let *A*
 10 be possible of no *B*, and simply belong to *C*. Since then
 the negative statement is convertible, *B* is possible of no *A*.
 But *A* belongs to all *C*; consequently *B* is possible of no *C*.
 For *C* falls under *A*. The same result would be obtained if
 the *minor* premiss were ¹ negative: for if *A* is possible of no
 15 *C*, *C* is possible of no *A*: but *A* belongs to all *B*, conse-
 quently *C* is possible of none of the *B*s: for again we have
 obtained the first figure. Neither then is *B* possible of *C*:
 for conversion is possible without modifying the relation.

But if the *affirmative* premiss is necessary, the conclusion
 20 will not be necessary. Let *A* belong to all *B* necessarily,
 but to no *C* simply. If then the negative premiss is con-
 verted, the first figure results. But it has been proved ² in
 the case of the first figure that if the negative major premiss
 is not necessary the conclusion will not be necessary either.
 Therefore the same result will obtain here. Further, if the
 25 conclusion is necessary, it follows that *C* necessarily does not
 belong to some *A*. For if *B* necessarily belongs to no *C*,
C will necessarily belong to no *B*. But *B* at any rate must
 belong to some *A*, if it is true (as was assumed) that *A*
 necessarily belongs to all *B*. Consequently it is necessary
 30 that *C* does not belong to some *A*. But nothing prevents
 such an *A* being taken that it is possible for *C* to belong
 to all of it. Further one might show by an exposition of
 terms that the conclusion is not necessary without qualifica-
 tion, though it is a necessary conclusion from the premisses.
 For example let *A* be animal, *B* man, *C* white, and let the
 premisses be assumed to correspond to what we had before: ³
 35 it is possible that animal should belong to nothing white.
 Man then will not belong to anything white, but not neces-
 sarily: for it is possible for man to be born white, not
 however so long as animal belongs to nothing white. Con-
 sequently under these conditions the conclusion will be
 necessary, but it is not necessary without qualification.

31^a Similar results will obtain also in particular syllogisms.
 For whenever the negative premiss is both universal and

¹ Read *τεθείη* in l. 14 with Al.¹, Phil.¹, and Them.
² l. 20.

³ ^a 23-33.

necessary, then the conclusion will be necessary: but whenever the affirmative premiss is universal, the negative particular, the conclusion will not be necessary. First then let the *negative* premiss be both universal and necessary: let it be possible for no *B* that *A* should belong to it, and let *A* simply belong to some *C*. Since the negative statement is convertible, it will be possible for no *A* that *B* should belong to it: but *A* belongs to some *C*; consequently *B* necessarily does not belong to some of the *C*s. Again let the *affirmative* premiss be both universal and necessary, and let the *major* premiss be affirmative. If then *A* necessarily belongs to all *B*, but does not belong to some *C*, it is clear that *B* will not belong to some *C*, but not necessarily. For the same terms can be used to demonstrate the point, which were used in the universal syllogisms.¹ Nor again, if the negative statement is necessary but particular, will the conclusion be necessary. The point can be demonstrated by means of the same terms.

- II In the *last* figure when the terms are related universally to the middle, and both premisses are affirmative, if one of the two is necessary, then the conclusion will be necessary. But if one is negative, the other affirmative, whenever the negative is necessary the conclusion also will be necessary, but whenever the affirmative is necessary the conclusion will not be necessary. First let both the premisses be affirmative, and let *A* and *B* belong to all *C*, and let *AC* be necessary. Since then *B* belongs to all *C*, *C* also will belong to some *B*, because the universal is convertible into the particular: consequently if *A* belongs necessarily to all *C*, and *C* belongs to some *B*, it is necessary that *A* should belong to some *B* also. For *B* is under *C*. The first figure then is formed. A similar proof will be given also if *BC* is necessary. For *C* is convertible with some *A*: consequently if *B* belongs necessarily to all *C*, it will belong necessarily also to some *A*.

Again let *AC* be negative, *BC* affirmative, and let the *negative* premiss be necessary. Since then *C* is convertible with some *B*, but *A* necessarily belongs to no *C*, *A* will

¹ 30^b 33-40.

necessarily not belong to some *B* either: for *B* is under *C*. But if the *affirmative* is necessary, the conclusion will not be necessary. For suppose *BC* is affirmative and necessary, while *AC* is negative and not necessary. Since then the
 40 affirmative is convertible, *C* also will belong to some *B* necessarily: consequently if *A* belongs to none of the *Cs*,
 31^b while *C* belongs¹ to some of the *Bs*, *A* will not belong to some of the *Bs*—but not of necessity; for it has been proved, in the case of the first figure, that if the negative premiss is not necessary, neither will the conclusion be necessary. Further, the point may be made clear by considering the
 5 terms. Let the term *A* be 'good', let that which *B* signifies be 'animal', let the term *C* be 'horse'. It is possible then that the term good should belong to no horse, and it is necessary that the term animal should belong to every horse: but it is not necessary that some animal should not be good, since it is possible for every animal to be good. Or if that is not possible, take as the term 'awake' or 'asleep': for
 10 every animal can accept these.

If, then, the premisses are universal, we have stated when the conclusion will be necessary. But if one premiss is universal, the other particular, and if both are affirmative, whenever the universal is necessary the conclusion also must
 15 be necessary. The demonstration is the same as before;² for the particular affirmative also is convertible. If then it is necessary that *B* should belong to all *C*, and *A* falls under *C*,³ it is necessary that *B* should belong to some *A*. But if *B* must belong to some *A*, then *A* must belong to some *B*: for conversion is possible. Similarly also if *AC* should be
 20 necessary and universal: for *B* falls under *C*.⁴ But if the *particular* premiss is necessary, the conclusion will not be necessary. Let the premiss *BC* be both particular and necessary, and let *A* belong to all *C*, not however necessarily. If the proposition *BC* is converted the first figure is formed,
 25 and the universal premiss is not necessary, but the particular is necessary. But when the premisses were thus, the conclusion (as we proved⁵) was not necessary: consequently it

¹ *sc.* necessarily.⁴ *i.e.* some *C* is *B*.² * 24-33.³ *i.e.* some *C* is *A*.⁵ 30^a 35-7, ^b 1-5.

is not here either. Further, the point is clear if we look at the terms. Let *A* be waking, *B* biped, and *C* animal. It is necessary that *B* should belong to some *C*, but it is possible for *A* to belong to *C*, and that *A* should belong to *B* is not ³⁰ necessary. For there is no necessity that some biped should be asleep or awake. Similarly and by means of the same terms proof can be made, should the proposition *AC* be both particular and necessary.

But if one premiss is affirmative, the other negative, whenever the universal is both negative and necessary the conclusion also will be necessary. For if it is not possible ³⁵ that *A* should belong to any *C*, but *B* belongs to some *C*, it is necessary that *A* should not belong to some *B*. But whenever the affirmative proposition is necessary, whether universal or particular, or the negative is particular, the conclusion will not be necessary. The proof of this by reduction will be the same as before;¹ but if terms are ⁴⁰ wanted, when the universal affirmative is necessary, take the terms 'waking'—'animal'—'man', 'man' being middle, and when the affirmative is particular and necessary, take ^{32^a} the terms 'waking'—'animal'—'white': for it is necessary that animal should belong to some white thing, but it is possible that waking should belong to none, and it is not necessary that waking should not belong to some animal. But when the negative proposition being particular is necessary, take the terms 'biped', 'moving', 'animal', ⁵ 'animal' being middle.

- ¹² It is clear then that a simple conclusion is not reached unless both premisses are simple assertions, but a necessary conclusion is possible although one only of the premisses is necessary. But in both cases, whether the syllogisms are affirmative or negative, it is necessary that one premiss ¹⁰ should be similar to the conclusion. I mean by 'similar', if the conclusion is a simple assertion, the premiss must be simple; if the conclusion is necessary, the premiss must be necessary. Consequently this also is clear, that the conclusion will be neither necessary nor simple unless a necessary or simple premiss is assumed.

¹ Cf. ^a 37—^b 4, ^b 20—7.

15 Perhaps enough has been said about the proof of necessity, how it comes about and how it differs from the
 proof of a simple statement. We proceed to discuss that
 which is possible, when and how and by what means it can
 be proved. I use the terms 'to be possible' and 'the pos-
 20 sible' of that which is not necessary but, being assumed,
 results in nothing impossible. We say indeed ambiguously
 of the necessary that it is possible. But that my definition
 of the possible is correct is clear from the phrases by which
 we deny or on the contrary affirm possibility. For the
 expressions 'it is not possible to belong', 'it is impossible to
 belong', and 'it is necessary not to belong' are either iden-
 25 tical or follow from one another; consequently their oppo-
 sites also, 'it is possible to belong', 'it is not impossible to
 belong', and 'it is not necessary not to belong', will either
 be identical or follow from one another. For of everything
 the affirmation or the denial holds good. That which is
 possible then will be not necessary and that which is not
 necessary will be possible. It results that all premisses in
 30 the mode of possibility are convertible into one another.
 I mean not that the affirmative are convertible into the
 negative, but that those which are affirmative in form admit
 of conversion by opposition, e.g. 'it is possible to belong'
 may be converted into 'it is possible not to belong', and
 'it is possible for *A* to belong to all *B*' into 'it is possible
 for *A* to belong to no *B*' or 'not to all *B*', and 'it is possible
 35 for *A* to belong to some *B*' into 'it is possible for *A* not to
 belong to some *B*'. And similarly the other propositions
 in this mode can be converted. For since that which is
 possible is not necessary, and that which is not necessary
 may possibly not belong, it is clear that if it is possible that
A should belong to *B*, it is possible also that it should not
 belong to *B*: and if it is possible that it should belong to all,
 it is also possible that it should not belong to all. The same
 40 holds good in the case of particular affirmations: for the
 32^b proof is identical. And such premisses are affirmative and
 not negative: for 'to be possible' is in the same rank as
 'to be', as was said above.¹

¹ 25^b 21.

Having made these distinctions we next point out that the expression 'to be possible' is used in two ways. In one 5 it means to happen generally and fall short of necessity, e. g. man's turning grey or growing or decaying, or generally what naturally belongs to a thing (for this has not its necessity unbroken, since man's existence is not continuous for ever, although if a man does exist, it comes about either necessarily or generally). In another sense the expression 10 means the indefinite, which can be both thus and not thus, e. g. an animal's walking or an earthquake's taking place while it is walking, or generally what happens by chance: for none of these inclines by nature in the one way more than in the opposite.

That which is possible in each of its two senses is convertible into its opposite, not however in the same way: 15 but what is natural is convertible because it does not necessarily belong (for in this sense it is possible that a man should not grow grey¹) and what is indefinite is convertible because it inclines this way no more than that. Science and demonstrative syllogism are not concerned with things which are indefinite, because the middle term is uncertain; but they are concerned with things that are natural, and 20 as a rule arguments and inquiries are made about things which are possible in this sense. Syllogisms indeed can be made about the former, but it is unusual at any rate to inquire about them.

These matters will be treated more definitely in the sequel;² our business at present is to state the moods and nature of the syllogism made from possible premisses. The expression 'it is possible for this to belong to that' may be understood 25 in two senses: 'that' may mean either that to which 'that' belongs or that to which it may belong; for the expression 'A is possible of the subject of B' means that it is possible either of that of which B is stated or of that of which B may possibly be stated. It makes no difference whether we say, A is possible of the subject of B, or all B admits of A. It is 30

¹ i.e. it is because man does not necessarily grow grey that 'man may grow grey' is convertible into 'man may not grow grey'.

² *Post. An.* i. 8.

clear then that the expression '*A* may possibly belong to all *B*' might be used in two senses. First then we must state the nature and characteristics of the syllogism which arises if *B* is possible of the subject of *C*, and *A* is possible of the subject of *B*. For thus both premisses are assumed
 35 in the mode of possibility; but whenever *A* is possible of that of which *B* is true, one premiss is a simple assertion, the other a problematic. Consequently we must start from premisses which are similar in form,¹ as in the other cases.

Whenever *A* may possibly belong to all *B*, and *B* to all *C*,¹⁴ there will be a perfect syllogism to prove that *A* may possibly
 40 belong to all *C*. This is clear from the definition: for it was
 33^a in this way that we explained 'to be possible for one term to belong to all of another'.² Similarly if it is possible for *A* to belong to no *B*, and for *B* to belong to all *C*, then it is possible for *A* to belong to no *C*. For the statement that it is possible for *A* not to belong to that of which *B* may be true means (as we saw) that none of those things which can
 5 possibly fall under the term *B* is left out of account. But whenever *A* may belong to all *B*, and *B* may belong to no *C*, then indeed no syllogism results from the premisses assumed, but if the premiss *BC* is converted after the manner of problematic propositions, the same syllogism results as before.³ For since it is possible that *B* should
 10 belong to no *C*, it is possible also that it should belong to all *C*. This has been stated above.⁴ Consequently if *B* is possible for all *C*, and *A* is possible for all *B*, the same syllogism again results. Similarly if in both the premisses the negative is joined with 'it is possible': e.g. if *A* may
 15 belong to none of the *B*s, and *B* to none of the *C*s. No syllogism results from the assumed premisses, but if they are converted we shall have the same syllogism as before.⁵ It is clear then that if the minor premiss is negative, or if both premisses are negative, either no syllogism results, or if
 20 one does it is not perfect. For the necessity results from the conversion.

¹ Read *ὁμοιοσημίων* in l. 37 with A₂, B, C, Al., Phil., and Waitz.

² 32^b 25-37.

³ In 32^b 38-40.

⁴ 32^a 34.

⁵ Read *ὅσπερ* for *ὥς* in l. 17 with B.

But if one of the premisses is universal, the other particular, when the major premiss is *universal* there will be a perfect syllogism. For if *A* is possible for all *B*, and *B* for some *C*, then *A* is possible for some *C*. This is clear from the definition of being possible.¹ Again if *A* may belong to 25 no *B*, and *B* may belong to some of the *C*s, it is necessary that *A* may possibly not belong to some of the *C*s. The proof is the same as above. But if the particular premiss is negative, and the universal is affirmative, the major still being universal and the minor particular, e.g. *A* is possible for all *B*, *B* may possibly not belong to some *C*, then a clear 30 syllogism does not result from the assumed premisses, but if the particular premiss is converted and it is laid down that *B* possibly may belong to some *C*, we shall have the same conclusion as before,² as in the cases given at the beginning.³

But if the major premiss is *particular*, the minor universal, 35 whether both are affirmative, or negative, or different in quality, or if both are indefinite or particular, in no way will a syllogism be possible. For nothing prevents *B* from reaching beyond *A*, so that as predicates they cover unequal areas. Let *C* be that by which *B* extends beyond *A*. To *C* 40 it is not possible that *A* should belong—either to all or to 33^b none or to some or not to some, since premisses in the mode of possibility are convertible and it is possible for *B* to belong to more things than *A* can. Further, this is obvious if we take terms; for if the premisses are as assumed, the major term is both possible for none of the minor and 5 must belong to all of it. Take as terms common to all the cases under consideration 'animal'—'white'—'man', where the major belongs necessarily to the minor; 'animal'—'white'—'garment', where it is not possible that the major should belong to the minor. It is clear then that if the terms are related in this manner, no syllogism results. For every syllogism proves that something belongs either simply 10 or necessarily or possibly. It is clear that there is no proof of the first or of the second. For the affirmative is destroyed by the negative, and the negative by the affirmative. There remains the proof of possibility. But this is impossible.

¹ 32^b 25-37.² I. 24.³ II. 5-17.

For it has been proved that if the terms are related in this
 15 manner it is both necessary that the major should belong
 to all the minor and not possible that it should belong to
 any. Consequently there cannot be a syllogism to prove
 the possibility; for the necessary (as we stated) is not
 possible.¹

It is clear that if the terms are universal in possible
 premisses a syllogism always results in the first figure,
 20 whether they are affirmative or negative, only a perfect
 syllogism results in the first case, an imperfect in the
 second. But possibility must be understood according to
 the definition laid down,² not as covering necessity. This
 is sometimes forgotten.

25 If one premiss is a simple proposition, the other a
 problematic, whenever the major premiss indicates possi-
 bility all the syllogisms will be perfect and establish
 possibility in the sense defined;³ but whenever the minor
 premiss indicates possibility all the syllogisms will be
 imperfect, and those which are negative will establish not
 30 possibility according to the definition, but that the major
 does not necessarily belong to any, or to all, of the minor.
 For if this is so, we say it is possible that it should belong
 to none or not to all. Let *A* be possible for all *B*, and let *B*
 belong to all *C*. Since *C* falls under *B*, and *A* is possible for
 35 all *B*, clearly it is possible for all *C* also. So a perfect
 syllogism results. Likewise if the premiss *AB* is negative,
 and the premiss *BC* is affirmative, the former stating
 possible, the latter simple attribution, a perfect syllogism
 40 results proving that *A* possibly belongs to no *C*.

34^a It is clear that perfect syllogisms result if the minor
 premiss states simple belonging: but that syllogisms will
 result if the modality of the premisses is reversed, must be
 proved *per impossibile*. At the same time it will be evident
 that they are imperfect: for the proof proceeds not from
 5 the premisses assumed. First we must state that if *B*'s
 being follows necessarily from *A*'s being, *B*'s possibility will
 follow necessarily from *A*'s possibility. Suppose, the terms

¹ 32^a 28.² 32^a 18.³ 32^a 18.

being so related,¹ that *A* is possible, and *B* is impossible. If then that which is possible, when it is possible for it to be, might happen, and if that which is impossible, when it is impossible, could not happen, and if at the same time *A* 10 is possible and *B* impossible, it would be possible for *A* to happen without *B*, and if to happen, then to be. For that which has happened, when it has happened, is. But we must take the impossible and the possible not only in the sphere of becoming, but also in the spheres of truth and predicability, and the various other spheres in which we speak of the possible: for it will be alike in all. Further 15 we must understand the statement that *B*'s being depends on *A*'s being, not as meaning that if some single thing *A* is, *B* will be: for nothing follows of necessity from the being of some one thing, but from two at least, i. e. when the premisses are related in the manner stated to be that of the syllogism. For if *C* is predicated of *D*, and *D* of *F*, then *C* 20 is necessarily predicated of *F*. And if each is possible, the conclusion also is possible. If then, for example, one should indicate the premisses by *A*, and the conclusion by *B*, it would not only result that if *A* is necessary *B* is necessary, but also that if *A* is possible, *B* is possible.

Since this is proved it is evident that if a false and not 25 impossible assumption is made, the consequence of the assumption will also be false and not impossible: e. g. if *A* is false, but not impossible, and if *B* is the consequence of *A*, *B* also will be false but not impossible. For since it has been proved that if *B*'s being is the consequence of *A*'s being, then *B*'s possibility will follow from *A*'s possibility 30 (and *A* is assumed to be possible), consequently *B* will be possible: for if it were impossible, the same thing would at the same time be possible and impossible.

Since we have defined these points, let *A* belong to all *B*, and *B* be possible for all *C*: it is necessary then that *A* 35 should be a possible attribute for all *C*. Suppose that it is not possible, but assume that *B* belongs to all *C*: this is false but not impossible. If then *A* is not possible for *C* but *B* belongs to all *C*, then *A* is not possible for all *B*: for

¹ That *B*'s being follows necessarily from *A*'s being.

40 a syllogism is formed in the third figure. But it was assumed that *A* is a possible attribute for all *B*. It is necessary then
 34^b that *A* is possible for all *C*. For though the assumption we made¹ is false and not impossible, the conclusion is impossible.² It is possible also in the first figure to bring about the impossibility, by assuming that *B* belongs to *C*. For if *B* belongs to all *C*, and *A* is possible for all *B*, then *A*
 5 would be possible for all *C*. But the assumption was made that *A* is not possible for all *C*.

We must understand 'that which belongs to all' with no limitation in respect of time, e.g. to the present or to a particular period, but simply without qualification. For it is by the help of such premisses that we make syllogisms,
 10 since if the premiss is understood with reference to the present moment, there cannot be a syllogism. For nothing perhaps prevents 'man' belonging at a particular time to everything that is moving, i.e. if nothing else were moving: but 'moving' is possible for every horse; yet 'man' is possible for no horse. Further let the major term be
 15 'animal', the middle 'moving', the minor 'man'. The premisses then will be as before, but the conclusion necessary, not possible. For man is necessarily animal. It is clear then that the universal must be understood simply, without limitation in respect of time.

Again let the premiss *AB* be universal and negative, and
 20 assume that *A* belongs to no *B*, but *B* possibly belongs to all *C*. These propositions being laid down, it is necessary that *A* possibly belongs to no *C*. Suppose that it cannot belong, and that *B* belongs to *C*, as above.³ It is necessary then that *A* belongs to some *B*: for we have a syllogism in
 25 the third figure: but this is impossible. Thus it will be possible for *A* to belong to no *C*; for if that is supposed false, the consequence is an impossible one. This syllogism then does not establish that which is possible according to the definition,⁴ but that which does not necessarily belong to any part of the subject (for this is the contradictory of

¹ That all *C* is *B*.

² And therefore the other premiss, that *A* is not possible for all *C*, must have been impossible.

³ ^a 36.

⁴ Cf. 32^a 18.

the assumption which was made: for it was supposed that *A* necessarily belongs to some *C*, but the syllogism *per impossibile* establishes the contradictory which is opposed to this).¹ Further, it is clear also from an example that the conclusion will not establish possibility. Let *A* be 'raven', *B* 'intelligent', and *C* 'man'. *A* then belongs to no *B*: for no intelligent thing is a raven. But *B* is possible for all *C*:² for every man may possibly be intelligent. But *A* necessarily belongs to no *C*: so the conclusion does not establish possibility. But neither is it always necessary. Let *A* be 'moving', *B* 'science', *C* 'man'. *A* then will belong to no *B*; but *B* is possible for all *C*. And the conclusion will not be necessary. For it is not necessary that no man should move; rather it is not necessary that any man should move.³ Clearly then the conclusion establishes that one term does not necessarily belong to any instance of another term. But we must take our terms better.

If the minor premiss is negative and indicates possibility, from the actual premisses taken there can be no syllogism, but if the problematic premiss is converted, a syllogism will be possible, as before.⁴ Let *A* belong to all *B*, and let *B* possibly belong to no *C*. If the terms are arranged thus, nothing necessarily follows: but if the proposition *BC* is converted and it is assumed that *B* is possible for all *C*, a syllogism results as before:⁵ for the terms are in the same relative positions.⁶ Likewise if both the relations are negative, if the major premiss states that *A* does not belong to *B*, and the minor premiss indicates that *B* may possibly belong to no *C*. Through the premisses actually taken nothing necessary results in any way; but if the problematic premiss is converted, we shall have a syllogism. Suppose that *A* belongs to no *B*, and *B* may possibly belong to no *C*. Through these comes nothing necessary. But, if *B* is assumed to be possible for all *C* (and this is true) and if the premiss *AB* remains as before, we shall again have the same syllogism. But if it be assumed that *B* *does* not

¹ Read a comma after *ἐπὶ ἀρχῇ* l. 30 and remove the bracket to after *ἀντιφάσεις* l. 31.

² 33^a 7.

³ 34^a 34.

⁴ i.e. the major premiss is pure, the minor problematic.

belong to any *C*, instead of possibly not belonging, there cannot be a syllogism anyhow, whether the premiss *AB* is negative or affirmative. As common instances of a necessary and positive relation we may take the terms white—animal—snow : of a necessary and negative relation, white—animal—pitch.

- 25 Clearly then if the terms are universal, and one of the premisses is assertoric, the other problematic, whenever the minor premiss is problematic a syllogism always results, only sometimes it results from the premisses that are taken, sometimes it requires the conversion of one premiss. We
 30 have statcd when each of these happens and the reason why. But if one of the relations is universal, the other particular, then whenever the major premiss is universal and problematic, whether affirmative or negative, and the particular is affirmative and assertoric, there will be a perfect syllogism, just as when the terms are universal.
 35 The demonstration is the same as before.¹ But whenever the major premiss is universal, but assertoric, not problematic, and the minor is particular and problematic, whether both premisses are negative or affirmative, or one is negative, the other affirmative, in all cases there will be an imperfect
 40 syllogism. Only some of them will be proved *per impossi-*
 35^b *bile*, others by the conversion of the problematic premiss, as has been shown above.² And a syllogism will be possible by means of conversion when the major premiss is universal and assertoric, whether positive or negative, and the minor
 5 particular, negative, and problematic, e.g. if *A* belongs to all *B* or to no *B*, and *B* may possibly not belong to some *C*. For if the premiss *BC* is converted in respect of possibility, a syllogism results. But whenever the particular premiss is assertoric and negative, there cannot be a syllogism. As instances of the positive relation we may take the terms
 10 white—animal—snow ; of the negative, white—animal—pitch. For the demonstration must be made through the indefinite nature of the particular premiss.³ But if the minor premiss is universal, and the major particular, whether either premiss is negative or affirmative, problematic or

¹ Cf. 33^b 33-40.

² * 14.

³ Cf. 26^b 14, 27^b 20.

assertoric, nohow is a syllogism possible. Nor is a syllogism possible when the premisses are particular or indefinite, 15 whether problematic or assertoric, or the one problematic, the other assertoric. The demonstration is the same as above.¹ As instances of the necessary and positive relation we may take the terms animal—white—man; of the necessary and negative relation, animal—white—garment. It is evident then that if the major premiss is universal, a syllogism 20 always results, but if the minor is universal nothing at all can ever be proved.

- 16 Whenever one premiss is necessary, the other problematic, there will be a syllogism when the terms are related as before;² and a perfect syllogism when the minor premiss is 25 necessary. If the premisses are affirmative the conclusion will be problematic, not assertoric, whether the premisses are universal or not: but if one is affirmative, the other negative, when the affirmative is necessary the conclusion will be problematic, not negative assertoric; but when the 30 negative is necessary the conclusion will be problematic negative, and assertoric negative, whether the premisses are universal or not. Possibility in the conclusion must be understood in the same manner as before.³ There cannot be an inference to the necessary negative proposition: for 'not necessarily to belong' is different from 'necessarily not 35 to belong'.

If the premisses are affirmative, clearly the conclusion which follows is not necessary. Suppose *A* necessarily belongs to all *B*, and let *B* be possible for all *C*. We shall have an imperfect syllogism to prove that *A* may belong to all *C*. That it is imperfect is clear from the proof: for it will be proved 40 in the same manner as above.⁴ Again, let *A* be possible 36^a for all *B*, and let *B* necessarily belong to all *C*. We shall then have a syllogism to prove that *A* may belong to all *C*, not that *A* does belong to all *C*: and it is perfect, not 5 imperfect: for it is completed directly through the original premisses.

But if the premisses are not similar in quality, suppose

¹ 33^a 34-^b 17. ² Cf. ^a 25-^b 8. ³ 33^b 29, 34^b 27. ⁴ 34^a 34-^b 6.

first that the *negative* premiss is necessary, and let *A* necessarily not be possible for any *B*, but let *B* be possible
 10 for all *C*. It is necessary then that *A* belongs to no *C*. For suppose *A* to belong to all *C* or to some *C*. Now we assumed that *A* is not possible for any *B*. Since then the negative proposition is convertible, *B* is not possible for any *A*. But *A* is supposed to belong to all *C* or to some *C*. Consequently *B* will not be possible for any *C* or for all *C*.
 15 But it was originally laid down that *B* is possible for all *C*. And it is clear that the possibility of not belonging can be inferred, since the fact of not belonging is inferred. Again, let the *affirmative* premiss be necessary, and let *A* possibly not belong to any *B*, and let *B* necessarily belong to all *C*.
 20 The syllogism will be perfect, but it will establish a problematic negative, not an assertoric negative. For the major premiss was problematic, and further it is not possible to prove the assertoric conclusion *per impossibile*. For if it were supposed that *A* belongs to some *C*, and it is laid down that *A* possibly does not belong to any *B*, no impossible relation between *B* and *C* follows from these premisses. But if the
 25 minor premiss is negative, when it is problematic a syllogism is possible by conversion, as above;¹ but when it is necessary no syllogism can be formed. Nor again when both premisses are negative, and the minor is necessary. The same terms as before² serve both for the positive
 30 relation—white—animal—snow, and for the negative relation—white—animal—pitch.

The same relation will obtain in particular syllogisms. Whenever the negative proposition is necessary, the conclusion will be negative assertoric: e.g. if it is not possible
 35 that *A* should belong to any *B*, but *B* may belong to some of the *C*s, it is necessary that *A* should not belong to some of the *C*s. For if *A* belongs to all *C*, but cannot belong to any *B*, neither can *B* belong to any *A*. So if *A* belongs to all *C*, to none of the *C*s can *B* belong. But it was laid down that *B* may belong to some *C*. But when the particular
 40 affirmative in the negative syllogism, e.g. *BC* the minor premiss, or the universal proposition in the affirmative syllogism,

¹ 35^b 7. Cf. 33^a 7.² 35^b 10.

e.g. *AB* the major premiss, is necessary, there will not be an assertoric conclusion. The demonstration is the same as before.¹ But if the minor premiss is universal, and problematic, whether affirmative or negative, and the major premiss is particular and necessary, there cannot be a syllogism. Premisses of this kind are possible both where the relation is positive and necessary, e.g. animal—white—man, and where it is necessary and negative, e.g. animal—white—garment. But when the universal is necessary, the particular problematic, if the universal is negative we may take the terms animal—white—raven to illustrate the positive relation, or animal—white—pitch to illustrate the negative; and if the universal is affirmative we may take the terms animal—white—swan to illustrate the positive relation, and animal—white—snow to illustrate the negative and necessary relation. Nor again is a syllogism possible when the premisses are indefinite, or both particular. Terms applicable in either case to illustrate the positive relation are animal—white—man: to illustrate the negative, animal—white—inanimate. For the relation of animal to some white, and of white to some inanimate, is both necessary and positive and necessary and negative. Similarly if the relation is problematic: so the terms may be used for all cases.

Clearly then from what has been said a syllogism results or not from similar relations of the terms whether we are dealing with simple existence or necessity, with this exception, that if the negative premiss is assertoric the conclusion is problematic, but if the negative premiss is necessary the conclusion is both problematic and negative assertoric. [It is clear also that all the syllogisms are imperfect and are perfected by means of the figures above mentioned.²]

- 17 In the second figure whenever both premisses are problematic, no syllogism is possible, whether the premisses are affirmative or negative, universal or particular. But when one premiss is assertoric, the other problematic, if the

¹ ^a 19-25.

² Maier, *Syllogistik des Aristoteles*, ii. 1. 176, n. 2, shows that this sentence has been wrongly introduced from 39^a 1.

30 affirmative is assertoric no syllogism is possible, but if the universal negative is assertoric a conclusion can always be drawn. Similarly when one premiss is necessary, the other problematic. Here also we must understand the term 'possible' in the conclusions, in the same sense as before.¹

35 First we must point out that the negative problematic proposition is not convertible, e.g. if *A* may belong to no *B*, it does not follow that *B* may belong to no *A*. For suppose it to follow and assume that *B* may belong to no *A*. Since then problematic affirmations are convertible with negations,
40 whether they are contraries or contradictories, and since *B*
37^a may belong to no *A*, it is clear that *B* may belong to all *A*. But this is false: for if all this can be that, it does not follow that all that can be this: consequently the negative proposition is not convertible. Further, these propositions are not incompatible, '*A* may belong to no *B*', '*B* necessarily does not belong to some of the *As*'; e.g. it is possible
5 that no man should be white (for it is also possible that every man should be white), but it is not true to say that it is possible that no white thing should be a man: for many white things are necessarily not men, and the necessary (as we saw ²) is other than the possible.

Moreover it is not possible to prove the convertibility of
10 these propositions by a *reductio ad absurdum*, i. e. by claiming assent to the following argument: 'since it is false that *B* may belong to no *A*, it is true that it cannot belong to no *A*, for the one statement is the contradictory of the other. But if this is so, it is true that *B* necessarily belongs to some of the *As*: consequently *A* necessarily belongs to some of the *Bs*. But this is impossible.'³ The argument cannot be admitted, for it does not follow that some *A* is
15 necessarily *B*, if it is not possible that no *A* should be *B*. For the latter expression is used in two senses, one if some *A* is necessarily *B*, another if some *A* is necessarily not *B*. For it is not true to say that that which necessarily does not belong to some of the *As* may possibly not belong to any *A*, just as it is not true to say that what necessarily

¹ 33^b 29, 34^b 27.

² 32^a 28.

³ Colon after *B*, full stop after ἀδύνατον in l. 14, with Maier.

belongs to some *A* may possibly belong to all *A*. If any one then should claim that because it is not possible for *C* to belong to all *D*, it necessarily does not belong to some *D*, he would make a false assumption: for it does belong to all *D*, but because in some cases it belongs necessarily, therefore we say that it is not *possible* for it to belong to all. Hence both the propositions '*A* necessarily belongs to some *B*' and '*A* necessarily does not belong to some *B*'¹ are opposed to the proposition '*A* may belong to all *B*'. Similarly also they are opposed to the proposition '*A* may belong to no *B*'. It is clear then that in relation to what is possible and not possible, in the sense originally defined,¹ we must assume, not that *A* necessarily belongs to some *B*, but that *A* necessarily does not belong to some *B*. But if this is assumed, no absurdity results: consequently no syllogism. It is clear from what has been said that the negative proposition is not convertible.²

This being proved, suppose it possible that *A* may belong to no *B* and to all *C*. By means of conversion no syllogism will result: for the major premiss, as has been said, is not convertible. Nor can a proof be obtained by a *reductio ad* 35

¹ 32^a 18.

² The argument put into the mouth of Aristotle's opponent in ll. 10-14 is as follows:

If *A* may be true of no *B*, *B* may be true of no *A*.

(*X*) For if not, *B* cannot be true of no *A*.

(*Y*) ∴ *B* must be true of some *A*.

∴ *A* must be true of some *B*.

But this is impossible, since *ex hypothesi* *A* may be true of no *B*.

∴ *B* may be true of no *A*.

Aristotle's criticism in ll. 14-31 is as follows:

The step from *X* to *Y* is unsound. '*B* must be true of some *A*' is not the only alternative to '*B* may be true of no *A*'. There is also the alternative '*B* must be untrue of some *A*'. *Necessity*, not only the necessity that some *B* be *A*, but equally the necessity that some *B* be not *A*, is incompatible with the *possibility* that no *B* be *A*.

The proper inference then in place of (*Y*) is 'Either *B* must be true of some *A*, or *B* must be untrue of some *A*'. And from the second alternative no impossible conclusion follows, so that the proof *per impossibile* that *B* may be true of no *A* fails.

Waitz's reading in l. 28 οὐ μόνον (cod. *B*) τὸ ἐξ ἀνάγκης . . . ἀλλὰ καὶ (*BC*) τὸ ἐξ ἀνάγκης is supported by Philop. and Them. But *Al.* has the *lectio difficilior* without μόνον and καί, and the other is evidently only an attempt to make things easier. Not either alternative, nor both, but the disjunction of the two, is the proper inference from *X*. But in answer to the opponent's assumption of *Y* we must make the counter-assumption '*B* must be untrue of some *A*'.

absurdum: for if it is assumed that *B* can belong to all *C*,¹ no false consequence results: for *A* may belong both to all *C* and to no *C*. In general, if there is a syllogism, it is clear that its conclusion will be problematic because neither of
 40 the premisses is assertoric; and this must be either affirmative or negative. But neither is possible. Suppose the conclusion is affirmative: it will be proved by an example
 37^b that the predicate cannot belong to the subject. Suppose the conclusion is negative: it will be proved that it is not problematic but necessary. Let *A* be white, *B* man, *C*
 5 horse. It is possible then for *A* to belong to all of the one and to none of the other. But it is not possible for *B* to belong nor not to belong to *C*. That it is not possible for it to belong, is clear. For no horse is a man. Neither is it possible for it not to belong. For it is necessary that no horse should be a man, but the necessary we found to be
 10 different from the possible.² No syllogism then results. A similar proof can be given if the major premiss is negative, the minor affirmative, or if both are affirmative or negative. The demonstration can be made by means of the same terms. And whenever one premiss is universal, the other particular, or both are particular or indefinite, or
 15 in whatever other way the premisses can be altered, the proof will always proceed through the same terms. Clearly then, if both the premisses are problematic, no syllogism results.

But if one premiss is assertoric, the other problematic, 18.
 20 if the affirmative is assertoric and the negative problematic no syllogism will be possible, whether the premisses are universal or particular. The proof is the same as above, and by means of the same terms. But when the affirmative premiss is problematic, and the negative assertoric,
 25 we shall have a syllogism. Suppose *A* belongs to no *B*, but can belong to all *C*. If the negative proposition is converted, *B* will belong to no *A*. But *A ex hypothesi* can

¹ If Aristotle is to be saved from a fallacious inference we must, with Maier, in ll. 35, 36 insert μή before παντί and before υπάρχειν. But in view of the consent of the MSS. and the ancient commentators the mistake seems to go back to Aristotle.

² 32^a 28.

belong to all *C*: so a syllogism is made, proving by means of the first figure that *B* may belong to no *C*. Similarly also if the *minor* premiss is negative. But if both premisses are negative, one being assertoric, the other problematic, 30 nothing follows necessarily from these premisses as they stand, but if the problematic premiss is converted into its complementary affirmative¹ a syllogism is formed to prove that *B* may belong to no *C*, as before: for we shall again have the first figure. But if both premisses are affirmative, 35 no syllogism will be possible. This arrangement of terms is possible both when the relation is positive, e.g. health, animal, man, and when it is negative, e.g. health, horse, man.

The same will hold good if the syllogisms are particular. 40 Whenever the affirmative proposition is assertoric, whether universal or particular, no syllogism is possible (this is 38^a proved similarly and by the same examples as above), but when the negative proposition is assertoric, a conclusion can be drawn by means of conversion, as before. Again if both the relations are negative, and the assertoric proposi- 5 tion is universal, although no conclusion follows from the actual premisses, a syllogism can be obtained by converting the problematic premiss into its complementary affirmative as before. But if the negative proposition is assertoric, but particular, no syllogism is possible, whether the other premiss is affirmative or negative. Nor can a conclusion be 10 drawn when both premisses are indefinite, whether affirmative or negative, or particular. The proof is the same and by the same terms.

- 19 If one of the premisses is necessary, the other problematic, then if the negative is necessary a syllogistic conclusion can be drawn, not merely a negative problematic but also a 15 negative assertoric conclusion; but if the affirmative premiss is necessary, no conclusion is possible. Suppose that *A* necessarily belongs to no *B*, but may belong to all *C*. If the negative premiss is converted *B* will belong to no *A*: but *A ex hypothesi* is capable of belonging to all *C*: so once

¹ Cf. 32^a 29.

20 more a conclusion is drawn by the first figure that *B* may belong to no *C*. But at the same time it is clear that *B will* not belong to any *C*. For assume that it does: then if *A* cannot belong to any *B*, and *B* belongs to some of the *Cs*, *A* cannot belong to some of the *Cs*: but *ex hypothesi* it
 25 may belong to all. A similar proof can be given if the *minor* premiss is negative. Again let the affirmative proposition be necessary, and the other problematic; i.e. suppose that *A* may belong to no *B*, but necessarily belongs to all *C*. When the terms are arranged in this way, no syllogism is
 30 possible. For (1) it sometimes turns out that *B* necessarily does not belong to *C*. Let *A* be white, *B* man, *C* swan. White then necessarily belongs to swan, but may belong to no man; and man necessarily belongs to no swan. Clearly then we cannot draw a problematic conclusion; for that
 35 which is necessary is admittedly distinct from that which is possible. (2) Nor again can we draw a necessary conclusion: for that presupposes that both premisses are necessary, or at any rate the negative premiss.¹ (3) Further it is possible also, when the terms are so arranged, that *B* should belong to *C*: for nothing prevents *C* falling under *B*, *A* being possible
 40 for all *B*, and necessarily belonging to *C*; e.g. if *C* stands for 'awake', *B* for 'animal', *A* for 'motion'. For motion
 38^b necessarily belongs to what is awake, and is possible for every animal: and everything that is awake is animal. Clearly then the conclusion cannot be the negative assertion, if the relation must be positive when the terms are related as above. Nor can the opposite affirmations² be established: consequently no syllogism is possible. A similar proof is
 5 possible if the *major* premiss is affirmative.

But if the premisses are similar in quality, when they are negative a syllogism can always be formed by converting the problematic premiss into its complementary affirmative as before.³ Suppose *A* necessarily does not belong to *B*,

¹ Cf. 30^b 7, 31^a 21.

² Read *καταφύσεων* in l. 4 with cod. n, Al. [Amm.], and Waitz. The opposite affirmations are

'*C* may be *B*'
 '*C* must be *B*'
 '*C* is *B*'.

³ Cf. 32^a 29.

and possibly may not belong to *C*: if the premisses are 10 converted *B* belongs to no *A*, and *A* may possibly belong to all *C*: thus we have the first figure. Similarly if the minor premiss is negative.¹ But if the premisses are affirmative there cannot be a syllogism. Clearly the conclusion cannot be a negative assertoric or a negative necessary 15 proposition because no negative premiss has been laid down either in the assertoric or in the necessary mode. Nor can the conclusion be a problematic negative proposition. For if the terms are so related, there are cases in which *B* necessarily will not belong to *C*; e.g. suppose that *A* is white, 20 *B* swan, *C* man. Nor can the opposite affirmations² be established, since we have shown a case in which *B* necessarily does not belong to *C*. A syllogism then is not possible at all.

Similar relations will obtain in particular syllogisms. For whenever the negative proposition is universal and necessary, 25 a syllogism will always be possible to prove both a problematic and a negative assertoric proposition (the proof proceeds by conversion); but when the affirmative proposition is universal and necessary, no syllogistic conclusion can be drawn. This can be proved in the same way as for universal propositions, and by the same terms.³ Nor is a syllogistic conclusion possible when both premisses are 30 affirmative: this also may be proved as above.⁴ But when both premisses are negative, and the premiss that definitely disconnects two terms is universal and necessary,⁵ though nothing follows necessarily from the premisses as they are stated, a conclusion can be drawn as above⁶ if the problematic premiss is converted into its complementary affirma- 35 tive. But if both are indefinite or particular, no syllogism can be formed. The same proof will serve, and the same terms.⁷

¹ *sc.* and necessary.

² Read *καταφάσεων* in l. 21 with Al. and Waitz.

³ Cf. *26^b 5.

⁴ ll. 12-23.

⁵ 'And necessary' is pointless, as the whole chapter is concerned only with combinations of a necessary with a problematic premiss. Possibly we should read *ἢ* for *καί* in l. 32. The reading of Al.'s lemma *στερητικοί καὶ καθόλου δὲ ἀναγκαῖα* suggests that *καί* may have originated by dittography.

⁶ ll. 25-7.

⁷ Cf. 36^b 12-18.

It is clear then from what has been said that if the universal and negative premiss is necessary, a syllogism is
 40 always possible, proving not merely a negative problematic, but also a negative assertoric proposition; but if the affirmative premiss is necessary no conclusion can be drawn. It is clear too that a syllogism is possible or not under the same
 39^a conditions whether the mode of the premisses is assertoric or necessary. And it is clear that all the syllogisms are imperfect, and are completed by means of the figures mentioned.

In the last figure a syllogism is possible whether both or
 5 only one of the premisses is problematic. When the premisses are problematic the conclusion will be problematic; and also when one premiss is problematic, the other assertoric. But when the other premiss is necessary, if it is affirmative the conclusion will be neither necessary nor assertoric; but
 10 if it is negative the syllogism will result in a negative assertoric proposition, as above.¹ In these also we must understand the expression 'possible' in the conclusion in the same way as before.

First let the premisses be problematic and suppose that
 15 both *A* and *B* may possibly belong to every *C*. Since then the affirmative proposition is convertible into a particular, and *B* may possibly belong to every *C*, it follows that *C* may possibly belong to some *B*. So, if *A* is possible for every *C*, and *C* is possible for some of the *B*s, then *A* is possible for some of the *B*s. For we have got the first figure. And if
 20 *A* may possibly belong to no *C*, but *B* may possibly belong to all *C*, it follows that *A* may possibly not belong to some *B*: for we shall have the first figure again by conversion. But if both premisses should be negative no necessary consequence will follow from them as they are stated, but if the
 25 premisses are converted into their corresponding affirmatives there will be a syllogism as before. For if *A* and *B* may possibly not belong to *C*, if 'may possibly belong' is substituted we shall again have the first figure by means of conversion. But if one of the premisses is universal, the other particular, a syllogism will be possible, or not, under the

¹ 38^a 14.

same arrangement of the terms as in the case of assertoric³⁰ propositions. Suppose that *A* may possibly belong to all *C*, and *B* to some *C*. We shall have the first figure again if the particular premiss is converted. For if *A* is possible for all *C*, and *C* for some of the *B*s, then *A* is possible for some of the *B*s. Similarly if the proposition *BC* is universal,³⁵ Likewise also if the proposition *AC* is negative, and the proposition *BC* affirmative: for we shall again have the first figure by conversion. But if both premisses should be negative—the one universal and the other particular—although no syllogistic conclusion will follow from the premisses as^{39^b} they are put, it will follow if they are converted, as above. But when both premisses are indefinite or particular, no syllogism can be formed: for *A* must belong sometimes to all *B* and sometimes to no *B*. To illustrate the affirmative relation take the terms animal—man—white; to illustrate⁵ the negative, take the terms horse—man—white—white being the middle term.

- 21 If one premiss is pure, the other problematic, the conclusion will be problematic, not pure; and a syllogism will be possible under the same arrangement of the terms as¹⁰ before.¹ First let the premisses be affirmative: suppose that *A* belongs to all *C*, and *B* may possibly belong to all *C*. If the proposition *BC* is converted, we shall have the first figure, and the conclusion that *A* may possibly belong to some of the *B*s. For when one of the premisses in the first¹⁵ figure is problematic, the conclusion also (as we saw²) is problematic. Similarly if the proposition *BC* is pure, *AC* problematic; or if *AC* is negative, *BC* affirmative, no matter which of the two is pure; in both cases the conclusion will be problematic: for the first figure is obtained once more,²⁰ and it has been proved that if one premiss is problematic in that figure the conclusion also will be problematic. But if the minor premiss *BC* is negative,³ or if both premisses are negative, no syllogistic conclusion can be drawn from

¹ i.e. where the premisses were pure, or problematic.

² 33^b 25–40.

³ Omit ἐνδεχόμενον in l. 22 with cod. n, Al., Phil., Them., and Waitz. ἐνδεχόμενον can easily be supplied in thought, since it is obvious that a negative assertoric minor gives no conclusion in the third figure.

the premisses as they stand, but if they are converted a
 25 syllogism is obtained as before.

If one of the premisses is universal, the other particular, then when both are affirmative, or when the universal is negative, the particular affirmative, we shall have the same sort of syllogisms: for all are completed by means of the
 30 first figure. So it is clear that we shall have not a pure but a problematic syllogistic conclusion. But if the affirmative premiss is universal, the negative particular, the proof will proceed by a *reductio ad impossibile*. Suppose that *B* belongs to all *C*, and *A* may possibly not belong to some *C*: it
 35 follows that *A* may possibly not belong to some *B*. For if *A* necessarily belongs to all *B*, and *B* (as has been assumed) belongs to all *C*, *A* will necessarily belong to all *C*: for this has been proved before.¹ But it was assumed at the outset that *A* may possibly not belong to some *C*.

40^a Whenever both premisses are indefinite or particular, no syllogism will be possible. The demonstration is the same as was given in the case of universal premisses,² and proceeds by means of the same terms.

If one of the premisses is necessary, the other problematic, 5 when the premisses are affirmative a problematic affirmative conclusion can always be drawn; when one proposition is affirmative, the other negative, if the affirmative is necessary a problematic negative can be inferred; but if the negative proposition is necessary both a problematic and a pure negative conclusion are possible. But a necessary negative
 10 conclusion will not be possible, any more than in the other figures. Suppose first that the premisses are affirmative, i. e. that *A* necessarily belongs to all *C*, and *B* may possibly belong to all *C*. Since then *A* must belong to all *C*, and *C* may belong to some *B*, it follows that *A* may (not does)
 15 belong to some *B*: for so it resulted³ in the first figure. A similar proof may be given if the proposition *BC* is necessary, and *AC* is problematic. Again suppose one

¹ 30^a 15-23.

² No such demonstration occurs in the discussion of the case of two universal premisses. The reference is a careless one to the discussion of the case of two problematic premisses, 39^b 2-6.

³ 35^a 26-8.

proposition is affirmative, the other negative, the *affirmative* being necessary: i.e. suppose *A* may possibly belong to no *C*, but *B* necessarily belongs to all *C*. We shall have ²⁰ the first figure once more: and—since the negative premiss is, problematic—it is clear that the conclusion will be problematic: for when the premisses stand thus in the first figure, the conclusion (as we found¹) is problematic. But if the *negative* premiss is necessary, the conclusion will be not ²⁵ only that *A* may possibly not belong to some *B* but also that it does not belong to some *B*. For suppose that *A* necessarily does not belong to *C*, but *B* may belong to all *C*. If the affirmative proposition *BC* is converted, we shall have the first figure, and the negative premiss is necessary. But when the premisses stood thus, it resulted² that *A* might ³⁰ possibly not belong to some *C*, and that it did not belong to some *C*; consequently here it follows that *A* does not belong to some *B*. But when the minor premiss is negative, if it is problematic we shall have a syllogism by altering the premiss into its complementary affirmative, as before; ³⁵ but if it is necessary no syllogism can be formed. For *A* sometimes necessarily belongs to all *B*, and sometimes cannot possibly belong to any *B*. To illustrate the former take the terms sleep—sleeping horse—man; to illustrate the latter take the terms sleep—waking horse—man.

Similar results will obtain if one of the terms is related universally to the middle, the other in part. If both pre- ⁴⁰ misses are affirmative, the conclusion will be problematic, not ^{40^b} pure; and also when one premiss is negative, the other affirmative, the latter being necessary. But when the negative premiss is necessary, the conclusion also will be a pure negative proposition; for the same kind of proof can be ⁵ given whether the terms are universal or not. For the syllogisms must be made perfect by means of the first figure, so that a result which follows in the first figure follows also in the third. But when the minor premiss is negative and universal, if it is problematic a syllogism can ¹⁰ be formed by means of conversion; but if it is necessary a syllogism is not possible. The proof will follow the same

¹ 36^a 17-25.² 36^a 32-9.

course as where the premisses are universal ; and the same terms may be used.

It is clear then in this figure also when and how a syllogism can be formed, and when the conclusion is problematic, and when it is pure. It is evident also that all syllogisms in
 15 this figure are imperfect, and that they are made perfect by means of the first figure.

It is clear from what has been said that the syllogisms in these figures are made perfect by means of universal syllogisms in the first figure and are reduced to them. That
 20 every syllogism without qualification can be so treated, will be clear presently, when it has been proved that every syllogism is formed through one or other of these figures.

It is necessary that every demonstration and every syllogism should prove either that something belongs or that it
 25 does not, and this either universally or in part, and further either ostensively or hypothetically. One sort of hypothetical proof is the *reductio ad impossibile*. Let us speak first of ostensive syllogisms: for after these have been pointed out the truth of our contention will be clear with regard to those which are proved *per impossibile*, and in general hypothetically.

30 If then one wants to prove syllogistically *A* of *B*, either as an attribute of it or as not an attribute of it, one must assert something of something else. If now *A* should be asserted of *B*, the proposition originally in question will have been assumed. But if *A* should be asserted of *C*, but *C* should not be asserted of anything, nor anything of it, nor anything else of *A*, no syllogism will be possible. For
 35 nothing necessarily follows from the assertion of some one thing concerning some other single thing. Thus we must take another premiss as well. If then *A* be asserted of something else, or something else of *A*, or something different of *C*, nothing prevents a syllogism being formed, but it will not be in relation to *B* through the premisses
 40 taken. Nor when *C* belongs to something else, and that to something else and so on, no connexion however being made
 41^a with *B*, will a syllogism be possible concerning *A* in its

relation to *B*. For in general we stated¹ that no syllogism can establish the attribution of one thing to another, unless some middle term is taken, which is somehow related to each by way of predication. For the syllogism in general is made out of premisses, and a syllogism referring to *this* 5 out of premisses with the same reference, and a syllogism relating *this* to *that* proceeds through premisses which relate this to that. But it is impossible to take a premiss in reference to *B*, if we neither affirm nor deny anything of it; or again to take a premiss relating *A* to *B*, if we take nothing common, but affirm or deny peculiar attributes of 10 each. So we must take something midway between the two, which will connect the predications, if we are to have a syllogism relating this to that. If then we must take something common in relation to both, and this is possible in three ways (either by predicating *A* of *C*, and *C* of *B*, or *C* 15 of both, or both of *C*), and these are the figures of which we have spoken, it is clear that every syllogism must be made in one or other of these figures. The argument is the same if several middle terms should be necessary to establish the relation to *B*; for the figure will be the same whether there is one middle term or many. 20

It is clear then that the ostensive syllogisms are effected by means of the aforesaid figures; these considerations will show that *reductiones ad impossibile* also are effected in the same way. For all who effect an argument *per impossibile* infer syllogistically what is false, and prove the original conclusion hypothetically when something impossible results 25 from the assumption of its contradictory; e.g. that the diagonal of the square is incommensurate with the side, because odd numbers are equal to evens if it is supposed to be commensurate.² One infers syllogistically that odd numbers come out equal to evens, and one proves hypothetically the incommensurability of the diagonal, since a falsehood results through contradicting this. For this 30 we found to be reasoning *per impossibile*, viz. proving some-

¹ Cf. 25^b 32.

² The proof is given in Euclid, *Elements*, Bk. x, App. 27 (ed. Heiberg and Menge). Cf. B. Russell, *Introduction to Mathematical Philosophy*, p. 67.

thing impossible by means of an hypothesis conceded at the beginning. Consequently, since the falsehood is established in reductions *ad impossibile* by an ostensive syllogism, and the original conclusion is proved hypothetically, and we have
 35 already stated that ostensive syllogisms are effected by means of these figures, it is evident that syllogisms *per impossibile* also will be made through these figures. Likewise all the other hypothetical syllogisms: for in every case the syllogism leads up to the proposition that is substituted
 40 for the original thesis; but the original thesis is reached by means of a concession or some other hypothesis.¹ But if
 41^b this is true, every demonstration and every syllogism must be formed by means of the three figures mentioned above. But when this has been shown it is clear that every syllogism is perfected by means of the first figure and is reducible to
 5 the universal syllogisms in this figure.

Further in every syllogism one of the premisses must be affirmative, and universality must be present: unless one of the premisses is universal either a syllogism will not be possible, or it will not refer to the subject proposed, or the original position will be begged. Suppose we have to prove
 10 that pleasure in music is good. If one should claim as a premiss that pleasure is good without adding 'all', no syllogism will be possible; if one should claim that some pleasure is good, then if it is different from pleasure in music, it is not relevant to the subject proposed; if it is this very pleasure, one is assuming that which was proposed at the outset to be proved. This is more obvious in geometrical proofs, e. g. that the angles at the base of an isosceles
 15 triangle are equal. Suppose the lines *A* and *B* have been drawn to the centre. If then one should assume that the angle *AC* is equal to the angle *BD*, without claiming generally that angles of semicircles are equal; and again if one should assume that the angle *C* is equal to the angle *D*, without the additional assumption that every angle of

¹ Aristotle is thinking of the method of establishing a proposition *A* is *B* by inducing the opponent to agree that *A* is *B* if *X* is *Y*. All that remains then is to establish syllogistically that *X* is *Y*. That *A* is *B* thus follows from the agreement.

a segment is equal to every other angle of the same segment ; and further if one should assume that when equal angles are taken from the whole angles, which are themselves equal, the remainders *E* and *F* are equal, he will beg the thing to 20 be proved, unless he also states that when equals are taken from equals the remainders are equal.¹

It is clear then that in every syllogism there must be a universal premiss, and that a universal statement is proved only when all the premisses are universal, while a particular statement is proved both from two universal premisses and from one only : consequently if the conclusion 25 is universal, the premisses also must be universal, but if the

¹ The diagram Aristotle has in mind appears to be the following :

Here *A* and *B* are the equal sides, *E* and *F* the angles at the base of the isosceles triangle. *C* and *D* are the angles formed by the base with the circumference. The angles formed by the equal sides with the base are loosely called *AC*, *BD*. That the angles of the semicircle of the segment mean those formed by the diameter and the chord respectively with the circumference (as supposed by Al. Phil., Pacius, and Blancanus), not those in the semicircle and in the segment (as supposed by Waitz) seems to be sufficiently indicated by the language of Euclid, iii. 16, 31. Contrast ἡ ἐν ἡμικυκλίῳ, *Post. An.* 94^a 28, *Met.* 1051^a 27.

premises are universal it is possible that the conclusion may not be universal. And it is clear also that in every syllogism, either both or one of the premises must be like the conclusion.

I mean not only in being affirmative or negative, but also in
30 being necessary, pure, or problematic. We must consider also the other forms of predication.

It is clear also when a syllogism in general can be made and when it cannot; and when a valid,¹ when a perfect syllogism can be formed; and that if a syllogism is formed the terms must be arranged in one of the ways that have
35 been mentioned.

It is clear too that every demonstration will proceed 25 through three terms and no more, unless the same conclusion is established by different pairs of propositions; e.g. the conclusion *E* may be established through the propositions *A* and *B*, and through the propositions *C* and *D*, or through the propositions *A* and *B*, or *A* and *C*, or *B* and *C*.² For
40 nothing prevents there being several middles for the same terms. But in that case there is not one but several
42^a syllogisms. Or again when each of the propositions *A* and *B* is obtained by syllogistic inference, e.g. *A* by means of *D* and *E*, and again *B* by means of *F* and *G*. Or one may be obtained by syllogistic, the other by inductive inference. But thus also the syllogisms are many; for the conclusions
5 are many, e.g. *A* and *B* and *C*. But if this can be called one syllogism, not many, the same conclusion may be reached by more than three terms in this way, but it cannot be reached as *C* is established by means of *A* and *B*.³ Suppose that the proposition *E* is inferred from the premises *A*, *B*, *C*, and *D*. It is necessary then that of these one
10 should be related to another as whole to part: for it has already been proved that if a syllogism is formed some of its terms must be related in this way.⁴ Suppose then that *A* stands in this relation to *B*. Some conclusion then

¹ sc. but imperfect.

² Insert *kal* *AI* after *AB* in l. 39 with *A*, *C*, *AL*, *Phil.*, and *Waitz*.

³ i.e. by way of a simple syllogism. This is incompatible with there being more than three terms.

⁴ 40^b 30.

follows from them. It must either be *E* or one or other of *C* and *D*, or something other than these.

(1) If it is *E* the syllogism will have *A* and *B* for its sole 15 premisses. But if *C* and *D* are so related that one is whole, the other part, some conclusion will follow from them also ; and it must be either *E*, or one or other of the propositions *A* and *B*, or something other than these. And if it is (i) *E*, or (ii) *A* or *B*, either (i) the syllogisms will be more than one, or (ii) the same thing happens to be inferred by means of several terms only in the sense which we saw to be possible.¹ But if (iii) the conclusion is other than *E* or *A* or *B*, the 20 syllogisms will be many, and unconnected with one another. But if *C* is not so related to *D* as to make a syllogism, the propositions will have been assumed to no purpose, unless for the sake of induction or of obscuring the argument or something of the sort.

(2) But if from the propositions *A* and *B* there follows not *E* but some other conclusion, and if from *C* and *D* either *A* or 25 *B* follows or something else, then there are several syllogisms, and they do not establish the conclusion proposed : for we assumed that the syllogism proved *E*. And if no conclusion follows from *C* and *D*, it turns out that these propositions have been assumed to no purpose, and the syllogism does not prove the original proposition. 30

So it is clear that every demonstration and every syllogism will proceed through three terms only.

This being evident, it is clear that a syllogistic conclusion follows from two premisses and not from more than two. For the three terms make two premisses, unless a new premiss is assumed, as was said at the beginning,² to perfect the syllogisms. It is clear therefore that in whatever 35 syllogistic argument the premisses through which the main conclusion follows (for some of the preceding conclusions must be premisses) are not even in number, this argument either has not been drawn syllogistically or it has assumed more than was necessary to establish its thesis. 40

¹ 1. 6.

² The reference is to the new premisses produced by conversion, when a syllogism in the second or third figure is being reduced to one in the first. Cf. 24^b 24.

42^b If then syllogisms are taken with respect to their main premisses, every syllogism will consist of an even number of premisses and an odd number of terms (for the terms exceed the premisses by one), and the conclusions will be half the
 5 number of the premisses. But whenever a conclusion is reached by means of prosyllogisms or by means of several continuous middle terms,¹ e. g. the proposition AB by means of the middle terms C and D , the number of the terms will similarly exceed that of the premisses by one (for the extra term must either be added outside or inserted: but in either
 10 case it follows that the relations of predication are one fewer than the terms related), and the premisses will be equal in number to the relations of predication. The premisses however will not always be even, the terms odd; but they will alternate—when the premisses are even, the terms must be odd; when the terms are even, the premisses must be odd: for along with one term one premiss is added, if a term is added from any quarter. Consequently since the premisses
 15 were (as we saw) even, and the terms odd, we must make them alternately even and odd at each addition. But the conclusions will not follow the same arrangement either in respect to the terms or to the premisses. For if one term is added, conclusions will be added less by one than the pre-existing terms: for the conclusion is drawn not in rela-
 20 tion to the single term last added, but in relation to all the rest, e. g. if to ABC the term D is added, two conclusions are thereby added, one in relation to A , the other in relation to B . Similarly with any further additions. And similarly too if the term is inserted in the middle: for in relation to one term only, a syllogism will not be constructed. Consequently
 25 the conclusions will be much more numerous than the terms or the premisses.

Since we understand the subjects with which syllogisms are concerned, what sort of conclusion is established in each figure, and in how many moods this is done, it is evident to us both what sort of problem is difficult and what sort is easy
 30 to prove. For that which is concluded in many figures and

¹ Omit $\mu\eta$ in L. 6 with cod. n, Al., Them., and Waitz.

through many moods is easier ; that which is concluded in few figures and through few moods is more difficult to attempt. The universal affirmative is proved by means of the first figure only and by this in only one mood ; the universal negative is proved both through the first figure and through the second, through the first in one mood, through the 35 second in two. The particular affirmative is proved through the first and through the last figure, in one mood through the first, in three moods through the last. The particular negative is proved in all the figures, but once in the first, in two moods in the second, in three moods in the third. It is 40 clear then that the universal affirmative is most difficult to establish, most easy to overthrow. In general, universals are easier game for the destroyer than particulars: for whether the predicate belongs to none or not to some, they are destroyed : and the particular negative is proved in all the figures, the universal negative in two. Similarly with 5 universal negatives: the original statement is destroyed, whether the predicate belongs to all or to some : and this we found possible in two figures. But particular statements can be refuted in one way only—by proving that the predicate belongs either to all or to none. But particular statements are easier to *establish*: for proof is possible in more figures and through more moods. And in general 10 we must not forget that it is possible to refute statements by means of one another, I mean, universal statements by means of particular, and particular statements by means of universal: but it is not possible to establish universal statements by means of particular, though it is possible to establish particular statements by means of universal. At the same time it is evident that it is easier to refute than to establish. 15

The manner in which every syllogism is produced, the number of the terms and premisses through which it proceeds, the relation of the premisses to one another, the character of the problem proved in each figure, and the number of the figures appropriate to each problem, all these matters are clear from what has been said.

We must now state how we may ourselves always have a 20

20 supply of syllogisms in reference to the problem proposed and by what road we may reach the principles relative to the problem: for perhaps we ought not only to investigate the construction of syllogisms, but also to have the power of making them.

25 Of all the things which exist some are such that they cannot be predicated of anything else truly and universally, e.g. Cleon and Callias, i.e. the individual and sensible, but other things may be predicated of them (for each of these is both man and animal); and some things are themselves
30 predicated of others, but nothing prior is predicated of them; and some are predicated of others, and yet others of them, e.g. man of Callias and animal of man. It is clear then that some things are naturally not stated of anything: for as a rule each sensible thing is such that it cannot be predicated of anything, save incidentally: for we sometimes say
35 that that white object is Socrates, or that that which approaches is Callias. We shall explain in another place¹ that there is an upward limit also to the process of predication: for the present we must assume this. Of these ultimate predicates it is not possible to demonstrate another predicate, save as a matter of opinion, but these may be predicated of other things. Neither can individuals
40 be predicated of other things, though other things can be predicated of them. Whatever lies between these limits can be spoken of in both ways: they may be stated of others, and others stated of them. And as a rule arguments and inquiries are concerned with these things.

43^b We must select the premisses suitable to each problem in this manner: first we must lay down the subject and the definitions and the properties of the thing; next we must lay down those attributes which follow² the thing, and again those which the thing follows, and those which cannot
5 belong to it. But those to which it cannot belong need not be selected, because the negative statement implied above

¹ *Post. An.* i. 19-22.

² The term 'follow' has been used to translate *ἐπεσθαι* with the implication of logical sequence. Though the usage is hardly idiomatic in regard to terms, one of which is consequent on or implied by the other, it has become current with respect to propositions.

is convertible. Of the attributes which follow we must distinguish those which fall within the definition, those which are predicated as properties, and those which are predicated as accidents, and of the latter those which apparently and those which really belong. The larger the supply a man has of these, the more quickly will he reach 10 a conclusion; and in proportion as he apprehends those which are truer, the more cogently will he demonstrate. But he must select not those which follow some particular but those which follow the thing as a whole, e. g. not what follows a particular man but what follows every man: for the syllogism proceeds through universal premisses. If the statement is indefinite, it is uncertain whether the premiss 15 is universal, but if the statement is definite, the matter is clear. Similarly one must select those attributes which the subject follows as wholes, for the reason given. But that which follows one must not suppose to follow as a whole, e. g. that every animal follows man or every science music, but only that it follows, without qualification. as indeed we state it in a proposition: for the other statement is useless 20 and impossible, e. g. that every man is every animal or justice is all good. But that which something follows receives the mark 'every'. Whenever the subject, for which we must obtain the attributes that follow, is contained by something else, what follows or does not follow the highest term universally must not be selected in dealing with the subordinate term (for these attributes have been taken 25 in dealing with the superior term; for what follows animal also follows man, and what does not belong to animal does not belong to man); but we must choose those attributes which are peculiar to each subject. For some things are peculiar to the species as distinct from the genus; for species being distinct there must be attributes peculiar to each. Nor must we take as things which the superior term follows, those things which the inferior term follows, e. g. take as subjects of the predicate 'animal' what are really 30 subjects of the predicate 'man'. It is necessary indeed, if animal follows man, that it should follow all these also. But these belong more properly to the choice of what

concerns man. One must apprehend also normal consequents and normal antecedents; for propositions which obtain normally are established syllogistically from premisses
 35 which obtain normally, some if not all of them having this character of normality. For the conclusion of each syllogism resembles its principles. We must not however choose attributes which are consequent upon all the terms:¹ for no syllogism can be made out of such premisses. The reason why this is so will be clear in the sequel.²

If men wish to establish something about some whole, 28
 40 they must look to the *subjects* of that which is being established (the subjects of which it happens to be asserted), and the *attributes* which follow that of which it is to be predicated. For if any of these subjects is the same as any of these attributes, the attribute originally in question must belong to the subject originally in question.³ But if the purpose is to establish not a universal but a particular proposition, they must look for the terms of which the
 44^a terms in question are predicable: for if any of these are identical, the attribute in question must belong to some of the subject in question.⁴ Whenever the one term has to belong to none of the other, one must look to the consequents of the subject, and to those attributes which cannot possibly be present in the predicate in question:⁵ or conversely to the attributes which cannot possibly be present
 5 in the subject, and to the consequents of the predicate.⁶ If any members of these groups are identical, one of the terms in question cannot possibly belong to any of the other. For sometimes a syllogism in the first figure results,⁷ sometimes a syllogism in the second. But if the object is to establish a particular negative proposition, we must find antecedents of the subject in question and attri-
 10 butes which cannot possibly belong to the predicate in question.⁸ If any members of these two groups are identical,

¹ i.e. on the major and minor terms. Two affirmative premisses in the second figure give no conclusion. ² 44^b 20.

³ We thus get a syllogism in Barbara.

⁴ Darapti.

⁵ Cesare.

⁶ Camestres.

⁷ By converting the major premiss of the Cesare syllogism or the minor premiss of the Camestres syllogism. ⁸ Felapton, by conversion.

it follows that one of the terms in question does not belong to some of the other. Perhaps each of these statements will become clearer in the following way. Suppose the consequents of *A* are designated by *B*, the antecedents of *A* by *C*, attributes which cannot possibly belong to *A* by *D*. Suppose again that the attributes of *E* are designated 15 by *F*, the antecedents of *E* by *G*, and attributes which cannot belong to *E* by *H*. If then one of the *C*s should be identical with one of the *F*s, *A* must belong to all *E*: for *F* belongs to all *E*, and *A*¹ to all *C*, consequently *A* belongs to all *E*. If *C* and *G* are identical, *A* must belong to some 20 of the *E*s: for *A* follows *C*, and *E* follows all *G*. If *F* and *D* are identical, *A* will belong to none of the *E*s by a prosyllogism: for since the negative proposition is convertible, and *F* is identical with *D*, *A* will belong to none of the *F*s, but *F* belongs to all *E*. Again, if *B* and *H* are identical, *A* will belong to none of the *E*s: for *B* will belong 25 to all *A*, but to no *E*:² for it was assumed to be identical with *H*, and *H* belonged to none of the *E*s. If *D* and *G* are identical, *A* will not belong to some of the *E*s: for it will not belong to *G*, because it does not belong to *D*: but *G* falls under *E*: consequently *A* will not belong to some 30 of the *E*s. If *B* is identical with *G*, there will be a converted syllogism: for *E*³ will belong to all *A*, since *B* belongs to *A* and *E* to *B* (for *B* was found to be identical with *G*): but that *A* should belong to all *E* is not necessary, but it must belong to some *E* because it is possible to convert the universal statement into a particular. 35

It is clear then that in every proposition which requires proof we must look to the aforesaid relations of the subject and predicate in question: for all syllogisms proceed through these. But if we are seeking consequents and antecedents we must look for those which are primary and most universal, e.g. in reference to *E* we must look to *KF* rather than to *F* 40 alone, and in reference to *A* we must look to *KC* rather than

¹ $\tau\acute{\alpha}\iota$ *A* in Bekker, l. 19, is a misprint for $\tau\acute{o}$ *A*.

² Read $\tau\acute{\alpha}\iota$ δ' for $\tau\acute{o}$ δ' in l. 26 with *A*₂, *C*, and Waitz.

³ Read *E* in l. 31 with *A*, *B*₂, *C*, and treat $\tau\acute{o}$ $\gamma\acute{\alpha}\rho$. . . *H* ll. 32-3 as parenthetical (Waitz).

44^b to *C* alone.¹ For if *A* belongs to *KF*, it belongs both to *F* and to *E*: but if it does not follow *KF*, it may yet follow *F*. Similarly we must consider the antecedents of *A* itself: for if a term follows the primary antecedents, it will follow those also which are subordinate, but if it does not follow the
5 former, it may yet follow the latter.

It is clear too that the inquiry proceeds through the three terms and the two premisses, and that all the syllogisms proceed through the aforesaid figures. For it is proved that *A* belongs to *all E*, whenever an identical term is found among the *Cs* and *Fs*. This will be the middle term; *A* and
10 *E* will be the extremes. So the first figure is formed. And *A* will belong to *some E*, whenever *C* and *G* are apprehended to be the same. This is the last figure: for *G* becomes the middle term. And *A* will belong to *no E*, when *D* and *F* are identical. Thus we have both the first figure and the middle figure; the first, because *A* belongs to *no F*, since
15 the negative statement is convertible, and *F* belongs to *all E*; the middle figure because *D* belongs to *no A*, and to *all E*. And *A* will *not* belong to *some E*, whenever *D* and *G* are identical. This is the last figure: for *A* will belong to *no G*, and *E* will belong to *all G*. Clearly then
20 all syllogisms proceed through the aforesaid figures, and we must not select consequents of all the terms,² because no syllogism is produced from them. For (as we saw)³ it is not possible at all to establish a proposition from consequents, and it is not possible to refute by means of a consequent of both the terms in question: for the middle term must belong to the one, and not belong to the other.

¹ Aristotle has in mind the proof in ^a 12-19, where

All *E* is *F*.

F = *C*.

All *C* is *A*.

∴ All *E* is *A*.

He now points out that it is preferable to take both the antecedents and the consequents of *A* and of *E* in their most general form, e.g. to take *KF*, a *καθόλου* which includes *F*, and *KC*, a *καθόλου* which includes *C*. If all *KF* is *A*, then all *F* and ∴ all *E* is *A*, and by taking account of *KF* as well as of *F* we shall have put the proof in a more satisfactory because more universal way.

² i.e. the consequents of *A* and *E*.

³ ^a 27^a 18-20, ^b 23-8.

It is clear too that other methods of inquiry by selection 25 of middle terms are useless to produce a syllogism, e.g. if the consequents of the terms in question are identical, or if the antecedents of *A* are identical with those attributes which cannot possibly belong to *E*, or if those attributes are identical which cannot belong to either term: for no syllogism is produced by means of these. For if the consequents are identical, e.g. *B* and *F*, we have the 30 middle figure with both premisses affirmative: if the antecedents of *A* are identical with attributes which cannot belong to *E*, e.g. *C* with *H*, we have the first figure with its minor premiss negative. If attributes which cannot belong to either term are identical, e.g. *C* and *H*, both premisses are 35 negative, either in the first or in the middle figure. But no syllogism is possible in this way.

It is evident too that we must find out which terms in this inquiry are identical, not which are different or contrary, first because the object of our investigation is the middle 40 term, and the middle term must be not diverse but identical. Secondly, wherever it happens that a syllogism results from 45^a taking contraries or terms which cannot belong to the same thing, all arguments can be reduced to the aforesaid moods, e.g. if *B* and *F* are contraries or cannot belong to the same thing. For if these are taken, a syllogism will be formed 5 to prove that *A* belongs to none of the *Es*, not however from the premisses taken but in the aforesaid mood. For *B* will belong to all *A* and to no *E*. Consequently *B* must be identical with one of the *Hs*. Again, if *B* and *G* cannot belong to the same thing, it follows that *A* will not belong 10 to some of the *Es*: for then too we shall have the middle figure: for *B* will belong to all *A* and to no *G*.¹ Consequently *B* must be identical with some of the *Hs*.² For the fact that *B* and *G* cannot belong to the same thing differs in no way from the fact that *B* is identical with some of the *Hs*: for that includes everything which cannot 15 belong to *E*.

It is clear then that from the inquiries taken by them-

¹ And \therefore not to some *E*.

² This does not actually follow.

selves no syllogism results ; but if *B* and *F* are contraries *B* must be¹ identical with one of the *H*s. and the syllogism
 20 results through these terms. It turns out then that those who inquire in this manner are looking gratuitously for some other way than the necessary way because they have failed to observe the identity of the *B*s with the *H*s.

Syllogisms which lead to impossible conclusions are similar to ostensive syllogisms ; they also are formed by means of
 25 the consequents and antecedents of the terms in question. In both cases the same inquiry is involved. For what is proved ostensively may also be concluded syllogistically *per impossibile* by means of the same terms ; and what is proved *per impossibile* may also be proved ostensively, e.g. that *A* belongs to none of the *E*s. For suppose *A* to belong to some *E* : then since *B* belongs to all *A* and *A*
 30 to some of the *E*s, *B* will belong to some of the *E*s : but it was assumed that it belongs to none. Again we may prove that *A* belongs to some *E* : for if *A* belonged to none of the *E*s, and *E* belongs to all *G*, *A* will belong to none of the *G*s : but it was assumed to belong to all. Similarly with the other propositions requiring proof. The proof
 35 *per impossibile* will always and in all cases be from the consequents and antecedents of the terms in question. Whatever the problem the same inquiry is necessary whether one wishes to use an ostensive syllogism or a reduction to impossibility. For both the demonstrations start from the same terms, e.g. suppose it has been proved that *A* belongs to no *E*, because it turns out that otherwise
 40 *B* belongs to some of the *E*s and this is impossible—if now it is assumed that *B* belongs to no *E* and to all *A*, it is clear
 45^b that *A* will belong to no *E*. Again if it has been proved by an ostensive syllogism that *A* belongs to no *E*, assume that *A* belongs to some *E* and it will be proved *per impossibile* to belong to no *E*. Similarly with the rest. In all cases it is necessary to find some common term other than
 5 the subjects of inquiry, to which the syllogism establishing the false conclusion may relate, so that if this premiss is

¹ Read ἀνάγκη δ' εἶ for εἶναι δὲ in l. 18 with Bnu and Waitz.

converted,¹ and the other remains as it is, the syllogism will be ostensive by means of the same terms. For the ostensive syllogism differs from the *reductio ad impossibile* in this: in the ostensive syllogism both premisses are laid down in accordance with the truth, in the *reductio ad impossibile* one of the premisses is assumed falsely. 10

These points will be made clearer by the sequel,² when we discuss the reduction to impossibility: at present this much must be clear, that we must look to terms of the kinds mentioned whether we wish to use an ostensive syllogism or a reduction to impossibility. In the other hypothetical 15 syllogisms, I mean those which proceed by substitution,³ or by positing a certain quality,⁴ the inquiry will be directed to the terms of the problem to be proved—not the terms of the original problem, but the new terms introduced; and the method of the inquiry will be the same as before. But we must consider and determine in how many ways hypo- 20 thetical syllogisms are possible.

Each of the problems then can be proved in the manner described; but it is possible to establish some of them syllogistically in another way, e.g. universal problems by the inquiry which leads up to a particular conclusion, with the addition of an hypothesis.⁵ For if the *Cs* and the *Gs* should be identical, but *E* should be assumed to belong to the *Gs* only, then *A* would belong to every *E*: and again 25 if the *Ds* and the *Gs* should be identical, but *E* should be predicated of the *Gs* only, it follows that *A* will belong to none of the *Es*. Clearly then we must consider the matter in this way also. The method is the same whether the relation is necessary or possible. For the inquiry will be the same, and the syllogism will proceed through terms

¹ i.e. if this false conclusion is replaced by its contradictory and this is treated as a premiss.

² ii. 14.

³ Cf. 41^a 39.

⁴ Al. and Phil. interpret this as referring to arguments *ἀπὸ τοῦ μᾶλλον καὶ ἧττον καὶ ὁμοίου*, from the possession of a quality in unequal or equal degree by two terms, i.e. arguments *a fortiori* and by analogy.

⁵ i.e. the assumption that *C = G*, which in 44^a 19–21 proved that some *E* is *A*, will, if we add the hypothesis that only *G* is *E*, prove that all *E* is *A*; and the assumption that *D = G*, which in 44^a 28–30 proved that some *E* is not *A*, will, if we suppose that only *G* is *E*, prove that no *E* is *A*.

30 arranged in the same order whether a possible or a pure proposition is proved. We must find in the case of possible relations, as well as terms that belong, terms which can belong though they actually do not: for we have proved that the syllogism which establishes a possible relation
35 proceeds through these terms as well. Similarly also with the other modes of predication.¹

It is clear then from what has been said not only that all syllogisms can be formed in this way, but also that they cannot be formed in any other. For every syllogism has been proved to be formed through one of the aforementioned
40 figures, and these cannot be composed through other terms than the consequents and antecedents of the terms in question: for from these we obtain the premisses and find the
46^a middle term. Consequently a syllogism cannot be formed by means of other terms.

The method is the same in all cases, in philosophy, in 3c
any art or study. We must look for the attributes and the
5 subjects of both our terms,² and we must supply ourselves with as many of these as possible, and consider them by means of the three terms, refuting statements in one way, confirming them in another, in the pursuit of truth starting from premisses in which the arrangement of the terms is in accordance with truth, while if we look for dialectical syllo-
10 gisms we must start from probable premisses. The principles of syllogisms have been stated in general terms, both how they are characterized and how we must hunt for them, so as not to look to everything that is said about the terms of the problem or to the same points whether we are confirming or refuting, or again whether we are con-
15 firming of all or of some, and whether we are refuting of all or some; we must look to fewer points and they must be definite. We have also stated how we must select with reference to everything that is, e. g. about good or knowledge. But in each science the principles which are peculiar³ are the most numerous. Consequently it is the business

¹ e. g. propositions asserting non-necessity, impossibility, &c.

² Read *ἐκάτερον* in l. 5 with A, B, C, AL., and Waitz.

³ Read *ἰδίαι* in l. 17 with AL. and Waitz.

of experience to give the principles which belong to each subject. I mean for example that astronomical experience supplies the principles of astronomical science: for once the 20 phenomena were adequately apprehended, the demonstrations of astronomy were discovered. Similarly with any other art or science. Consequently, if the attributes of the thing are apprehended, our business will then be to exhibit readily the demonstrations. For if none of the true attributes of things had been omitted in the historical survey, 25 we should be able to discover the proof and demonstrate everything which admitted of proof, and to make that clear, whose nature does not admit of proof.

In general then we have explained fairly well how we must select premisses: we have discussed the matter accurately in the treatise concerning dialectic.¹ 30

31 It is easy to see that division into classes² is a small part of the method we have described: for division is, so to speak, a weak syllogism; for what it ought to prove, it begs, and it always establishes something more general than the attribute in question. First, this very point had escaped all those who used the method of division; and 35 they attempted to persuade men that it was possible to make a demonstration of substance and essence. Consequently they did not understand what it is possible to prove syllogistically by division,³ nor did they understand that it was possible to prove syllogistically in the manner we have described.⁴ In demonstrations, when there is a need to prove a positive statement, the middle term through which 40 the syllogism is formed must always be inferior to and not 46^b comprehend the first of the extremes. But division has a contrary intention: for it takes the universal as middle. Let animal be the term signified by *A*, mortal by *B*, and immortal by *C*, and let man, whose definition is to be got,

¹ *Topics*, especially i. 14.

² Aristotle is thinking of Plato's establishment of definitions by means of division by dichotomy.

³ Read διαπομπέων in l. 38 with codd. mn, Al., Phil., Them., and Waitz.

⁴ In cc. 1-30.

5 be signified by *D*. The man who divides assumes that every animal is either mortal or immortal: i.e. whatever is *A* is all either *B* or *C*. Again, always dividing, he lays it down that man is an animal, so he assumes *A* of *D* as belonging to it. Now the true conclusion is that every *D*
 10 is either *B* or *C*, consequently man must be either mortal or immortal, but it is not necessary that man should be a mortal animal—this is begged: and this is what ought to have been proved syllogistically. And again, taking *A* as mortal animal, *B* as footed, *C* as footless, and *D* as man, he assumes in the
 15 same way that *A* inheres either in *B* or in *C* (for every mortal animal is either footed or footless), and he assumes *A* of *D* (for he assumed man, as we saw, to be a mortal animal); consequently it is necessary that man should be either a footed or a footless animal; but it is not necessary that man should be footed: this he assumes: and it is just this again which he ought to have demonstrated. Always dividing
 20 then in this way it turns out that these logicians assume as middle the universal term, and as extremes that which ought to have been the subject of demonstration and the *differentiae*. In conclusion, they do not make it clear, and show it to be necessary, that this is man or whatever the subject of inquiry may be: for they pursue the other method
 25 altogether, never even suspecting the presence of the rich supply of evidence which might be used. It is clear that it is neither possible to refute a statement by this method of division, nor to draw a conclusion about an accident or property of a thing, nor about its genus, nor in cases in which it is unknown whether it is thus or thus, e.g. whether the diagonal is incommensurate. For if he assumes that
 30 every length is either commensurate or incommensurate, and the diagonal is a length, he has proved that the diagonal is either incommensurate or commensurate. But if he should assume that it is incommensurate, he will have assumed what he ought to have proved. He cannot then prove it: for this is his method, but proof is not possible by this method. Let *A* stand for 'incommensurate or commensurate', *B* for
 35 'length', *C* for 'diagonal'. It is clear then that this method of investigation is not suitable for every inquiry, nor is it

useful in those cases in which it is thought to be most suitable.

From what has been said it is clear from what elements demonstrations are formed and in what manner, and to what points we must look in each problem.

- 32 Our next business is to state how we can reduce syllogisms to the aforementioned figures: for this part of the inquiry 47 still remains. If we should investigate the production of the syllogisms and had the power of discovering them, and further if we could resolve the syllogisms produced into the aforementioned figures, our original problem would be 5 brought to a conclusion. It will happen at the same time that what has been already said will be confirmed and its truth made clearer by what we are about to say. For everything that is true must in every respect agree with itself.

First then we must attempt to select the two premisses 10 of the syllogism (for it is easier to divide into large parts than into small,¹ and the composite parts are larger than the elements out of which they are made); next we must inquire which are universal and which particular, and if both premisses have not been stated, we must ourselves assume the one which is missing. For sometimes men put forward the universal premiss, but do not posit the premiss 15 which is contained in it, either in writing or in discussion: or men put forward the premisses of the principal syllogism, but omit those through which they are inferred, and invite the concession of others to no purpose.² We must inquire then whether anything unnecessary has been assumed, or anything necessary has been omitted, and we must posit the one and take away the other, until we have 20 reached the two premisses: for unless we have these, we cannot reduce³ arguments put forward in the way described. In some arguments it is easy to see what is wanting, but some escape us, and appear to be syllogisms, because something necessary results from what has been laid

¹ i. e. the terms.

² *Top.* viii. 1.

³ Read *ἀναγνώρις* in l. 21 with B, C₂, Al., and Wäitz.

down, e. g. if the assumptions were made that substance is
25 not annihilated by the annihilation of what is not substance,
and that if the elements out of which a thing is made
are annihilated, then that which is made out of them is
destroyed: these propositions being laid down, it is neces-
sary that any part of substance is substance; this has not
however been drawn by syllogism from the propositions
assumed, but premisses are wanting. Again if it is necessary
that animal should exist, if man does, and that substance
should exist, if animal does, it is necessary that substance
30 should exist if man does: but as yet the conclusion has not
been drawn syllogistically: for the premisses are not in the
shape we required. We are deceived in such cases because
something necessary results from what is assumed, since
the syllogism also is necessary. But that which is necessary
is wider than the syllogism: for every syllogism is necessary,
35 but not everything which is necessary is a syllogism. Con-
sequently, though something results when certain proposi-
tions are assumed, we must not try to reduce it directly,
but must first state the two premisses, then divide them into
their terms. We must take that term as middle which
is stated in both the premisses: for it is necessary that the
40 middle should be found in both premisses in all the figures.
47^b If then the middle term is a predicate and a subject of
predication, or if it is a predicate, and something else is
denied of it, we shall have the first figure: if it both is a
predicate and is denied of something, the middle figure:
if other things are predicated of it, or one is denied, the other
5 predicated, the last figure. For it was thus that we found
the middle term placed in each figure. It is placed similarly
too if the premisses are not universal: for the middle term
is determined in the same way. Clearly then, if the same
term is not stated more than once in the course of an
argument, a syllogism cannot be made: for a middle term
has not been taken. Since we know what sort of thesis is
10 established in each figure, and in which the universal, in
what sort the particular is established, clearly we must not
look for all the figures, but for that which is appropriate to
the thesis in hand. If the thesis is established in more

figures than one, we shall recognize the figure by the position of the middle term.

- 33 Men are frequently deceived about syllogisms because ¹⁵ the inference is necessary, as has been said above; ¹ sometimes they are deceived by the similarity in the positing of the terms; and this ought not to escape our notice. E. g. if *A* is stated of *B*, and *B* of *C*: it would seem that a syllogism is possible since the terms stand thus: but nothing necessary results, nor does a syllogism. Let *A* represent ²⁰ the term 'being eternal', *B* 'Aristomenes as an object of thought', *C* 'Aristomenes'. It is true then that *A* belongs to *B*. For Aristomenes as an object of thought is eternal. But *B* also belongs to *C*: for Aristomenes is Aristomenes as an object of thought. But *A* does not belong to *C*: for ²⁵ Aristomenes is perishable. For no ² syllogism was made although the terms stood thus: that required that the premiss *AB* should be stated universally. But this is false, that every Aristomenes who is an object of thought is eternal, since Aristomenes is perishable. Again let *C* stand for 'Miccalus', *B* for 'musical Miccalus', *A* for 'perishing ³⁰ to-morrow'. It is true to predicate *B* of *C*: for Miccalus is musical Miccalus. Also *A* can be predicated of *B*: for musical Miccalus might perish to-morrow.³ But to state *A* of *C* is false at any rate. This argument then is identical with the former; for it is not true universally that musical ³⁵ Miccalus perishes to-morrow: but unless this is assumed, no syllogism (as we have shown) is possible.

This deception then arises through ignoring a small distinction. For we accept the conclusion as though it made no difference whether we said 'This belongs to that' or 'This belongs to all of that'.

- 34 Men will frequently fall into fallacies through not setting ^{48^a} out the terms of the premiss well, e. g. suppose *A* to be health, *B* disease, *C* man. It is true to say that *A* cannot belong to any *B* (for health belongs to no disease) and again that *B* belongs to every *C* (for every man is capable ⁵

¹ ^a 31.

² Read οὐ γὰρ in l. 26 with A, B, C, and Waitz.

³ i.e. Miccalus might to-morrow cease to be musical.

of disease). It would seem to follow that health cannot belong to any man. The reason for this is that the terms are not set out well in the statement, since if the things which are in the conditions are substituted, no syllogism
 10 can be made, e.g. if 'healthy' is substituted for 'health' and 'diseased' for 'disease'. For it is not true to say that being healthy cannot belong to one who is diseased. But unless this is assumed no conclusion results, save in respect of possibility: but such a conclusion is not impossible: for
 15 it is possible that health should belong to no man. Again the fallacy may occur in a similar way in the middle figure: 'it is not possible that health should belong to any disease, but it is possible that health should belong to every man, consequently it is not possible that disease should belong to any man'. In the third figure the fallacy results in reference to possibility. For health and disease, and
 20 knowledge and ignorance, and in general contraries, may possibly belong to the same thing, but cannot belong to one another. This is not in agreement with what was said before: for we stated¹ that when several things could belong to the same thing, they could belong to one another.

It is evident then that in all these cases the fallacy arises
 25 from the setting out of the terms: for if the things that are in the conditions are substituted, no fallacy arises. It is clear then that in such premisses what possesses the condition ought always to be substituted for the condition and taken as the term.

We must not always seek to set out the terms in a single
 30 word: for we shall often have complexes of words to which a single name is not given. Hence it is difficult to reduce syllogisms with such terms. Sometimes too fallacies will result from such a search, e.g. the belief that syllogism can establish that which has no mean. Let *A* stand for two right angles, *B* for triangle, *C* for isosceles triangle. *A* then
 35 belongs to *C* because of *B*: but *A* belongs to *B* without the mediation of another term: for the triangle in virtue of its own nature contains two right angles, consequently

¹ 39^a 14-19.

there will be no middle term for the proposition, AB , although it is demonstrable. For it is clear that the middle must not always be assumed to be an individual thing, but sometimes a complex of words, as happens in the case mentioned.

- 36 That the first term belongs to the middle, and the middle 40 to the extreme,¹ must not be understood in the sense that they can always be predicated of one another or that the first term will be predicated of the middle in the 'same way' 48^b as the middle is predicated of the last term. The same holds if the premisses are negative. But we must suppose the verb 'to belong' to have as many meanings as the senses in which the verb 'to be' is used, and in which the assertion that a thing 'is' may be said to be true. Take for example the statement that there is a single science 5 of contraries. Let A stand for 'there being a single science', and B for things which are contrary to one another. Then A belongs to B , not in the sense that contraries are² the fact of there being a single science of them, but in the sense that it is true to say of the contraries that there is a single science of them.

It happens sometimes that the first term is stated of the 10 middle, but the middle is not stated of the third term, e.g. if wisdom is knowledge, and wisdom is of the good, the conclusion is that there is knowledge of the good. The good then is not knowledge, though wisdom is knowledge. Sometimes the middle term is stated of the third, but the 15 first is not stated of the middle, e.g. if there is a science of everything that has a quality, or is a contrary, and the good both is a contrary and has a quality, the conclusion is that there is a science of the good, but the good is not science, nor is that which has a quality or is a contrary, though the good is both of these. Sometimes neither the first term is stated of the middle, nor the 20 middle of the third, while the first is sometimes stated of the third, and sometimes not: e.g. if there is a genus of that of which there is a science, and if there is a science

¹ i.e. the minor.

² Omit the comma after *ἐναντία* in l. 7 with Al. and Waitz.

of the good, we conclude that there is a genus of the good. But nothing is predicated of anything. And if that
 25 of which there is a science is a genus, and if there is a science of the good, we conclude that the good is a genus. The first term then is predicated of the extreme, but in the premisses one thing is not stated of another.

The same holds good where the relation is negative. For 'that does not belong to this' does not always mean
 30 that 'this is not that', but sometimes that 'this is not of that' or 'for that', e.g. 'there is not a motion of a motion or a becoming of a becoming, but there is a becoming of pleasure: so pleasure is not a becoming.' Or again it may be said that there is a sign of laughter, but there is not a sign of a sign, consequently laughter is not a sign. This holds in the other cases too, in which the thesis is refuted
 35 because the genus is asserted in a particular way, in relation to the terms of the thesis.¹ Again take the inference 'opportunity is not the right time: for opportunity belongs to God, but the right time does not, since nothing is useful to God'. We must take as terms opportunity—right time—God: but the premiss must be understood according to the case of the noun. For we state this universally without
 40 qualification, that the terms ought always to be stated in the nominative, e.g. man, good, contraries, not in oblique
 49^a cases, e.g. of man, of good, of contraries, but the premisses ought to be understood with reference to the cases of each term—either the dative, e.g. 'equal to this', or the genitive, e.g. 'double of this', or the accusative, e.g. 'that which strikes or sees this', or the nominative, e.g. 'man is an
 5 animal', or in whatever other way the word falls in the premiss.

The expressions 'this belongs to that' and 'this holds 37 true of that' must be understood in as many ways as there are different categories, and these categories must be taken either with or without qualification, and further as simple or compound: the same holds good of the corresponding

¹ .e. negative syllogisms in the second figure in which the middle term is not strictly predicated of the extremes but is said to stand in some relation to them such as is indicated by the use of an oblique case.

negative expressions. We must consider these points and 10
define them better.

- 38 A term which is repeated in the premisses ought to be joined to the first extreme, not to the middle. I mean for example that if a syllogism should be made proving that there is knowledge of justice, that it is good, the expression 'that it is good' (or '*quod* good') should be joined to the first term. Let *A* stand for 'knowledge that it is good', 15
B for good, *C* for justice. It is true to predicate *A* of *B*. For of the good there is knowledge that it is good. Also it is true to predicate *B* of *C*. For justice is identical with a good. In this way an analysis of the argument can be made. But if the expression 'that it is good' were added to *B*, the conclusion will not follow: for *A* will be 20
true of *B*, but *B* will not be true of *C*. For to predicate of justice the term 'good that it is, good' is false and not intelligible. Similarly if it should be proved that the healthy is an object of knowledge *quod* good, or goat-stag an object of knowledge *quod* not existing,¹ or man perishable *quod* an object of sense: in every case in which an addition is made to the predicate, the addition must be joined to the 25
extreme.²

The position of the terms is not the same when something is established without qualification and when it is qualified by some attribute or condition, e.g. when the good is proved to be an object of knowledge and when it is proved to be an object of knowledge that it is good.³ If it has been proved to be an object of knowledge without 30
qualification, we must put as middle term 'that which is', but if we add the qualification 'that it is good', the middle term must be 'that which is something'. Let *A* stand for 'knowledge that it is something', *B* stand for 'something', and *C* stand for 'good'. It is true to predicate *A* of *B*: for *ex hypothesi* there is a science of that which is something, that it is something. *B* too is true of *C*: for that which *C*

¹ i.e. in the sense that it can be known not to exist. Omit *δοξαόντων* in l. 24 with A, B, C, Al., Phil., and Waitz.

² i.e. the major term.

³ Omit *τι* in l. 29 with Al., Phil., Them., and Waitz.

35 represents is something. Consequently A is true of C :
 there will then be knowledge of the good, that it is good:
 for *ex hypothesi* the term 'something' indicates the thing's
 special nature. But if 'being' were taken as middle and
 'being' simply were joined to the extreme, not 'being some-
 thing', we should not have had a syllogism proving that
 there is knowledge of the good, that it is good, but that
 49^b it is; e.g. let A stand for knowledge that it is, B for being,
 C for good. Clearly then in syllogisms which are thus
 limited we must take the terms in the way stated.

We ought also to exchange terms which have the same 39
 value, word for word, and phrase for phrase, and word and
 5 phrase, and always take a word in preference to a phrase:
 for thus the setting out of the terms will be easier. For
 example if it makes no difference whether we say that the
 supposable is not the genus of the opinable or that the
 opinable is not identical with a particular kind of supposable
 (for what is meant is the same in both statements), it is
 better to take as the terms the supposable and the opinable
 in preference to the phrase suggested.

10 Since the expressions 'pleasure is good' and 'pleasure is 40
 the good' are not identical, we must not set out the terms
 in the same way; but if the syllogism is to prove that
 pleasure is the good, the term must be 'the good', but
 if the object is to prove that pleasure is good, the term
 will be 'good'. Similarly in all other cases.

15 It is not the same, either in fact or in speech, that A 41
 belongs to all of that to which B belongs, and that A belongs
 to all of that to all of which B belongs: for nothing
 prevents B from belonging to C , though not to all C : e.g.
 let B stand for beautiful, and C for white. If beauty belongs
 to something white, it is true to say that beauty belongs to
 that which is white; but not perhaps to everything that is
 20 white. If then A belongs to B , but not to everything of
 which B is predicated, then whether B belongs to all C or
 merely belongs to C , it is not necessary that A should
 belong, I do not say to all C , but even to C at all. But if
 A belongs to everything of which B is truly stated, it will

follow that *A* can be said of *all* of that of *all* of which *B* is said. If however *A* is said of that of *all* of which¹ *B* may²⁵ be said, nothing prevents *B* belonging to *C*, and yet *A* not belonging to all *C* or to any *C* at all. If then we take three terms it is clear that the expression '*A* is said of all of which *B* is said'² means this, '*A* is said of all the things of which *B* is said'. And if *B* is said of all of a third term, so also is³⁰ *A*: but if *B* is not said of all of the third term, there is no necessity that *A* should be said of all of it.

We must not suppose that something absurd results through setting out the terms: for we do not use the existence of this particular thing, but imitate the geometrician who says that 'this line a foot long' or 'this³⁵ straight line' or 'this line without breadth' exists although it does not, but does not use the diagrams in the sense that he reasons from them. For in general, if two things are not related as whole to part and part to whole, the prover does not prove from them, and so no syllogism is formed. We (I mean the learner) use the process of setting out terms^{50^a} like perception by sense, not as though it were impossible to demonstrate without these illustrative terms, as it is to demonstrate without the premisses of the syllogism.

42 We should not forget that in the same syllogism not all⁵ conclusions are reached through one figure, but one through one figure, another through another. Clearly then we must analyse arguments in accordance with this. Since not every problem is proved in every figure, but certain problems in each figure, it is clear from the conclusion in what figure¹⁰ the premisses should be sought.

43 In reference to those arguments aiming at a definition which have been directed to prove some part of the definition, we must take as a term the point to which the argument has been directed, not the whole definition: for so we shall be less likely to be disturbed by the length of the term: e.g. if a man proves that water is a drinkable liquid, we must take as terms drinkable and water.¹⁵

¹ Omit the comma after λέγεται in l. 26 with Waitz.

² Omit the comma after B in l. 28 with Waitz. The Greek phrase is there ambiguous, and Aristotle's object is to remove this ambiguity.

Further we must not try to reduce hypothetical syllogisms ; 44
 for with the given premisses it is not possible to reduce them.
 For they have not been proved by syllogism, but assented
 to by agreement. For instance if a man should suppose
 20 that unless there is one faculty of contraries, there cannot be
 one science, and should then argue that not every¹ faculty
 is of contraries, e. g. of what is healthy and what is sickly :
 for the same thing will then be at the same time healthy
 and sickly. He has shown² that there is not one faculty of
 all contraries, but he has not proved that there is not
 25 a science. And yet one must agree. But the agreement
 does not come from a syllogism, but from an hypothesis.
 This argument cannot be reduced : but the proof that there
 is not a single faculty can. The latter argument perhaps
 was a syllogism : but the former was an hypothesis.

The same holds good of arguments which are brought
 30 to a conclusion *per impossibile*. These cannot be analysed
 either ; but the reduction to what is impossible can be
 analysed since it is proved by syllogism, though the rest of
 the argument cannot, because the conclusion is reached from
 an hypothesis. But these differ from the previous arguments :
 for in the former a preliminary agreement must be reached
 if one is to accept the conclusion ; e. g. an agreement that if
 there is proved to be one faculty of contraries, then contraries
 35 fall under the same science ; whereas in the latter, even if no
 preliminary agreement has been made, men still accept the
 reasoning, because the falsity is patent, e. g. the falsity of
 what follows from the assumption that the diagonal is com-
 mensurate, viz. that then odd numbers are equal to evens.³

Many other arguments are brought to a conclusion by the
 40 help of an hypothesis ; these we ought to consider and mark
 out clearly. We shall describe in the sequel⁴ their differences,
 50^b and the various ways in which hypothetical arguments are
 formed : but at present this much must be clear, that it is
 not possible to resolve such arguments into the figures. And
 we have explained the reason.

¹ Read *ἡᾱρα* for *μία* in l. 21 with B, Al., and Waitz.

² Read *ἐπιδέδεικται* for *ἀποδείδεικται* in l. 24 with A, B, C, and Waitz.

³ Cf. 41^a 26.

⁴ This promise is not fulfilled in Aristotle's extant works.

45 Whatever problems are proved in more than one figure, it 5
 they have been established in one figure by syllogism, can
 be reduced to another figure, e.g. a negative syllogism in
 the first figure can be reduced to the second, and a syllogism
 in the middle figure to the first, not all however but some
 only. The point will be clear in the sequel. If *A* belongs
 to no *B*, and *B* to all *C*, then *A* belongs to no *C*. Thus the 10
 first figure; but if the negative statement is converted, we
 shall have the middle figure. For *B* belongs to no *A*, and
 to all *C*. Similarly if the syllogism is not universal but
 particular, e.g. if *A* belongs to no *B*, and *B* to some *C*.
 Convert the negative statement and you will have the 15
 middle figure.

The universal syllogisms in the second figure can be
 reduced to the first, but only one of the two particular
 syllogisms. Let *A* belong to no *B* and to all *C*. Convert
 the negative statement, and you will have the first figure. 20
 For *B* will belong to no *A*, and *A* to all *C*. But if the
 affirmative statement concerns *B*, and the negative *C*, *C* must
 be made first term. For *C* belongs to no *A*, and *A* to all *B*:
 therefore *C* belongs to no *B*. *B* then belongs to no *C*: for
 the negative statement is convertible. 25

But if the syllogism is particular, whenever the *negative*
 statement concerns the major extreme, reduction to the
 first figure will be possible, e.g. if *A* belongs to no *B* and to
 some *C*: convert the negative statement and you will have
 the first figure. For *B* will belong to no *A*, and *A* to some
C. But when the *affirmative* statement concerns the major 30
 extreme, no resolution will be possible, e.g. if *A* belongs to
 all *B*, but not to all *C*: for the statement *AB* does not
 admit of conversion,¹ nor would there be a syllogism if it
 did.

Again syllogisms in the third figure cannot all be resolved 35
 into the first, though all syllogisms in the first figure can be
 resolved into the third. Let *A* belong to all *B* and *B* to
 some *C*. Since the particular affirmative is convertible, *C*
 will belong to some *B*: but *A* belonged to all *B*: so that
 the third figure is formed. Similarly if the syllogism is

¹ i.e. simple conversion.

negative: for the particular affirmative is convertible: therefore *A* will belong to no *B*, and to some *C*.

51^a Of the syllogisms in the last figure one only cannot be resolved into the first, viz. when the negative statement is not universal: all the rest can be resolved. Let *A* and *B* be affirmed of all *C*: then *C* can be converted partially with either *A* or *B*: *C* then belongs to some *B*. Consequently we shall get the first figure, if *A* belongs to all *C*, and *C* to some of the *B*s. If *A* belongs to all *C* and *B* to some *C*, the argument is the same: for *B* is convertible in reference to *C*. But if *B* belongs to all *C* and *A* to some *C*, the first term must be *B*: for *B* belongs to all *C*, and *C* to some *A*, therefore *B* belongs to some *A*. But since the particular statement is convertible, *A* will belong to some *B*. If the syllogism is negative, when the terms are universal we must take them in a similar way. Let *B* belong to all *C*, and *A* to no *C*: then *C* will belong to some *B*, and *A* to no *C*; and so *C* will be middle term. Similarly if the negative statement is universal, the affirmative particular: for *A* will belong to no *C*, and *C* to some of the *B*s. But if the negative statement is particular, no resolution will be possible, e. g. if *B* belongs to all *C*, and *A* does not belong to some *C*: convert the statement *BC* and both premisses will be particular.

It is clear that in order to resolve the figures¹ into one another the premiss which concerns the minor extreme must be converted in both the figures: for when this premiss is altered, the transition to the other figure is made.

One of the syllogisms in the middle figure can, the other cannot, be resolved into the third figure. Whenever the universal statement is negative, resolution is possible. For if *A* belongs to no *B* and to some *C*, both *B* and *C* alike are convertible in relation to *A*, so that *B* belongs to no *A*, and *C* to some *A*. *A* therefore is middle term. But when *A* belongs to all *B*, and not to some *C*, resolution will not be possible: for neither of the premisses is universal after conversion.

Syllogisms in the third figure can be resolved into the

¹ i.e. the first and third figures.

middle figure, whenever the negative statement is universal, 35
e.g. if *A* belongs to no *C*, and *B* to some or all *C*. For *C*
then will belong to no *A* and to some *B*. But if the negative
statement is particular, no resolution will be possible: for
the particular negative does not admit of conversion.

It is clear then that the same syllogisms cannot be 40
resolved in these figures which could not be resolved into the
first figure, and that when syllogisms are reduced to the 51^b
first figure these alone are confirmed by reduction to what is
impossible.

It is clear from what we have said how we ought to
reduce syllogisms, and that the figures may be resolved into
one another.

- 46 In establishing or refuting, it makes some difference 5
whether we suppose the expressions 'not to be this' and
'to be not-this' are identical or different in meaning, e.g.
'not to be white' and 'to be not-white'. For they do not
mean the same thing, nor is 'to be not-white' the negation
of 'to be white', but 'not to be white'. The reason for this 10
is as follows. The relation of 'he can walk' to 'he can not-
walk' is similar to the relation of 'it is white' to 'it is not-
white'; so is that of 'he knows what is good' to 'he knows
what is not-good'. For there is no difference between the ex-
pressions 'he knows what is good' and 'he is knowing what 15
is good', or 'he can walk' and 'he is able to walk': there-
fore there is no difference between their contraries 'he cannot
walk'—'he is not able to walk'. If then 'he is not able to
walk' means the same as 'he is able not to walk', capacity
to walk and incapacity to walk will belong at the same time
to the same person (for the same man can both walk and not-
walk, and is possessed of knowledge of what is good and of 20
what is not-good), but an affirmation and a denial which are
opposed to one another do not belong at the same time to
the same thing. As then 'not to know what is good' is not
the same as 'to know what is not good', so 'to be not-good'
is not the same as 'not to be good'. For when two pairs
correspond, if the one pair are different from one another, the
other pair also must be different. Nor is 'to be not-equal' the 25

same as 'not to be equal': for there is something underlying the one, viz. that which is not-equal, and this is the unequal, but there is nothing underlying the other. Wherefore not everything is either equal or unequal, but everything is equal or is not equal. Further the expressions 'it is a not-white log' and 'it is not a white log' do not imply one another's
 30 truth. For if 'it is a not-white log', it must be a log: but that which is not a white log need not be a log at all. Therefore it is clear that 'it is not-good' is not the denial of 'it is good'. If then every single statement may truly be said to be either an affirmation or a negation, if it is not a negation clearly it must in a sense be an affirmation. But every affirmation has a corresponding
 35 negation. The negation then of 'it is not-good' is 'it is not not-good'. The relation of these statements to one another is as follows. Let *A* stand for 'to be good', *B* for 'not to be good', let *C* stand for 'to be not-good' and be placed under *B*,¹ and let *D* stand for 'not to be not-good' and be placed under *A*. Then either *A* or *B* will belong to everything, but they will never belong to the same thing;
 40 and either *C* or *D* will belong to everything, but they will never belong to the same thing. And *B* must belong to everything to which *C* belongs. For if it is true to say
 52^a 'it is not-white', it is true also to say 'it is not white': for it is impossible that a thing should simultaneously be white and be not-white, or be a not-white log and be a white log; consequently if the affirmation does not belong, the denial must belong. But *C* does not always belong to *B*: for what
 5 is not a log at all, cannot be a not-white log either. On the other hand *D* belongs to everything to which *A* belongs. For either *C* or *D* belongs to everything to which *A* belongs. But since a thing cannot be simultaneously not-white

¹ The text implies the following diagram:

| | |
|--|----------------------------|
| <i>A</i> (It is good.) | <i>B</i> (It is not good.) |
| <i>D</i> (It is not not-good.) | <i>C</i> (It is not-good.) |
| Aristotle points out that <i>A</i> and <i>B</i> are contradictory. | |
| <i>C</i> and <i>D</i> " " | |
| <i>A</i> and <i>C</i> " contrary. | |
| <i>B</i> and <i>D</i> " compatible. | |
| <i>D</i> is inferable from <i>A</i> . | |
| <i>B</i> " " " <i>C</i> . | |

and white, *D* must belong to everything to which *A* belongs. For of that which is white it is true to say that it is not not-white. But *A* is not true of all *D*. For of that which is not a log at all it is not true to say *A*, viz. that it is a 10 white¹ log. Consequently *D* is true, but *A* is not true, i. e. that it is a white log. It is clear also that *A* and *C* cannot together belong to the same thing, and that *B* and *D* may possibly belong to the same thing.

Privative terms are similarly related to positive terms in 15 respect of this arrangement. Let *A* stand for 'equal', *B* for 'not equal', *C* for 'unequal', *D* for 'not unequal'.

In many things also, to some of which something belongs which does not belong to others, the negation may be true in a similar way,² viz. that all are not white or that each is 20 not white, while that each is not-white or all are not-white is false. Similarly also 'every animal is not-white' is not the negation of 'every animal is white' (for both are false): the proper negation is 'every animal is not white'. Since it is clear that 'it is not-white' and 'it is not white' mean 25 different things, and one is an affirmation, the other a denial, it is evident that the method of proving each cannot be the same, e. g. that whatever is an animal is not white or may not be white, and that it is true to call it not-white; for this means that it is not-white. But we may prove that it is true to call it white or not-white in the same way—for both are 30 proved constructively by means of the first figure. For the expression 'it is true' stands on a similar footing to 'it is'. For the negation of 'it is true to call it white' is not 'it is true to call it not-white' but 'it is not true to call it white'. If then it is to be³ true to say that whatever is a man is musical or is not-musical, we must assume that whatever 35 is an animal either is musical or is not-musical; and the proof has been made. That whatever is a man is not musical is proved destructively in the three ways mentioned.⁴

In general whenever *A* and *B* are such that they cannot belong at the same time to the same thing, and one of the 40 two necessarily belongs to everything, and again *C* and *D*

¹ Omit *ob* in l. 11 with B, C₂, A₁, and Waitz.

² Cf. ll. 4, 5.

³ Read *forai* in l. 34.

⁴ Celarent, Cesare, Camestres.

52^b are related in the same way, and *A* follows *C* but the relation cannot be reversed, then *D* must follow *B* and the relation cannot be reversed. And *A* and *D* may belong to the same thing, but *B* and *C* cannot. First it is clear from the following consideration that *D* follows *B*. For since either *C* or *D* necessarily belongs to everything; and since *C* cannot belong to that to which *B* belongs, because it carries *A* along with it and *A* and *B* cannot belong to the same thing; it is clear that *D* must follow *B*. Again since *C* does not reciprocate with *A*, but *C* or *D* belongs to everything, it is possible that *A* and *D* should belong to the same thing. But *B* and *C* cannot belong to the same thing, because *A* follows *C*; and so something impossible results. It is clear then that *B* does not reciprocate with *D* either, since it is possible that *D* and *A* should belong at the same time to the same thing.

It results sometimes even in such an arrangement of terms that one is deceived through not apprehending the opposites rightly, one of which must belong to everything, e.g. we may reason that 'if *A* and *B* cannot belong at the same time to the same thing, but it is necessary that one of them should belong to whatever the other does not belong to: and again *C* and *D* are related in the same way, and *A* follows everything which *C* follows: it will result¹ that *B* belongs necessarily to everything to which *D* belongs': but this is false. 'Assume that *F* stands for the negation of *A* and *B*, and again that *H* stands for the negation of *C* and *D*. It is necessary then that either *A* or *F* should belong to everything: for either the affirmation or the denial must belong. And again either *C* or *H* must belong to everything: for they are related as affirmation and denial. And *ex hypothesi* *A* belongs to everything to which *C* belongs. Therefore *H* belongs to everything to which *F* belongs. Again since either *F* or *B* belongs to everything, and similarly either *H* or *D*, and since *H* follows *F*, *B* must follow *D*: for we know this.² If then *A* follows *C*, *B* must follow *D*'. But this is false: for as we proved³ the sequence is reversed in terms

¹ Omit γὰρ in l. 19 with *A* and *B*.

² * 19-b 13.

³ From * 39-b 13.

so constituted. The fallacy arises because perhaps it is not necessary that *A* or *F* should belong to everything, or that ³⁰ *F* or *B* should belong to everything: for *F* is not the denial of *A*. For *not-good* is the negation of good: and not-good is not identical with 'neither good nor not-good'. Similarly also with *C* and *D*. For two negations have been assumed in respect to one term.¹

¹ In II. 18, 21.

BOOK II

52^b WE have already explained the number of the figures, the character and number of the premisses, when and how
 40 a syllogism is formed ;¹ further what we must look for when
 53^a refuting and establishing propositions, and how we should investigate a given problem in any branch of inquiry, also by what means we shall obtain principles appropriate to each subject.² Since some syllogisms are universal, others
 5 particular, all the universal syllogisms give more than one result, and of particular syllogisms the affirmative yield more than one, the negative yield only the stated conclusion. For all propositions are convertible save only the particular negative : and the conclusion states one definite thing about another definite thing. Consequently all syllogisms save the particular negative yield more than one conclusion, e. g. if
 10 *A* has been proved to belong to all or to some *B*, then *B* must belong to some *A* : and if *A* has been proved to belong to no *B*, then *B* belongs to no *A*. This is a different conclusion from the former. But if *A* does not belong to some *B*, it is not necessary that *B* should not belong to some *A* : for it may possibly belong to all *A*.
 15 This then is the reason common to all syllogisms whether universal or particular. But it is possible to give another reason concerning those which are universal. For all the things that are subordinate to the middle term or to the conclusion may be proved by the same syllogism, if the former are placed in the middle, the latter in the conclusion ;
 20 e. g. if the conclusion *AB* is proved through *C*, whatever is subordinate to *B* or *C* must accept the predicate *A* : for if *D* is included in *B* as in a whole, and *B* is included in *A*, then *D* will be included in *A*. Again if *E* is included in *C* as in a whole, and *C* is included in *A*, then *E* will be included in *A*. Similarly if the syllogism is negative. In the second

¹ i. 1-26.

² . 27-31.

figure it will be possible to infer only that which is subordi- 25
nate to the conclusion, e. g. if *A* belongs to no *B* and to all
C; we conclude that *B* belongs to no *C*. If then *D*
is subordinate to *C*, clearly *B* does not belong to it. But
that *B* does not belong to what is subordinate to *A*, is not
clear by means of the syllogism. And yet *B* does not 30
belong to *E*, if *E* is subordinate to *A*. But while it has
been proved through the syllogism that *B* belongs to no *C*,
it has been assumed without proof that *B* does not belong to
A, consequently it does not result through the syllogism that
B does not belong to *E*.

But in particular syllogisms there will be no necessity of
inferring what is subordinate to the conclusion (for a syllogism 35
does not result when this premiss¹ is particular), but what-
ever is subordinate to the middle term may be inferred,
not however through the syllogism, e. g. if *A* belongs to all
B and *B* to some *C*. Nothing can be inferred about that
which is subordinate to *C*; something can be inferred
about that which is subordinate to *B*, but not through the
preceding syllogism. Similarly in the other figures. That 40
which is subordinate to the conclusion cannot be proved;
the other subordinate can be proved, only not through the 53^b
syllogism, just as in the universal syllogisms what is
subordinate to the middle term is proved (as we saw) from
a premiss which is not demonstrated: consequently either a
conclusion is not possible in the case of universal syllogisms
or else it is possible also in the case of particular syllogisms.

- 2 It is possible for the premisses of the syllogism to be
true, or to be false, or to be the one true, the other false. 5
The conclusion is either true or false necessarily. From
true premisses it is not possible to draw a false conclusion,
but a true conclusion may be drawn from false premisses,
true however only in respect to the fact, not to the reason.
The reason cannot be established from false premisses: why
this is so will be explained in the sequel.² 10

¹ i. e. the conclusion of the original syllogism, which would have to
become the major premiss of the further syllogism required. A parti-
cular major premiss yields no conclusion (in the first figure).

² 57^a 40-^b 17.

First then that it is not possible to draw a false conclusion from true premisses, is made clear by this consideration. If it is necessary that *B* should be when *A* is, it is necessary that *A* should not be when *B* is not. If then *A* is true, *B* must be true: otherwise it will turn out that the same
 15 thing both is and is not at the same time. But this is impossible. Let it not, because *A* is laid down as a single term, be supposed that it is possible, when a single fact is given, that something should necessarily result. For that is not possible. For what results necessarily is the conclusion, and the means by which this comes about are at the least three terms, and two relations of subject and
 20 predicate or premisses. If then it is true that *A* belongs to all that to which *B* belongs, and that *B* belongs to all that to which *C* belongs, it is necessary that *A* should belong to all that to which *C* belongs, and this cannot be false: for then the same thing will belong and not belong at the same time. So *A* is posited as one thing, being two premisses taken together. The same holds good of negative
 25 syllogisms: it is not possible to prove a false conclusion from true premisses.

But from what is false a true conclusion may be drawn, whether both the premisses are false or only one, provided that this is not either of the premisses indifferently,¹ if it is taken as wholly false: but if the premiss is not taken as wholly false, it does not matter which of the two is false.²
 30 (1) Let *A* belong to the whole of *C*, but to none of the *B*s,

¹ Omit ἀλλὰ τῆς δευτέρας in l. 28 with codd. Bu.

² The following cases are discussed in the sequel:

Universal premisses.

- | | |
|--------------------------------------|---|
| 53 ^b 30-54 ^a 1 | Both premisses wholly false, conclusion true. |
| 54 ^a 1, 2 | Both premisses partly false, conclusion true. |
| 54 ^a 2-18 | Major wholly false, minor true, conclusion false. |
| 54 ^a 18-28 | Major partly false, minor true, conclusion true. |
| 54 ^a 28- ^b 2 | Major true, minor wholly false, conclusion true. |
| 54 ^b 2-16 | Major true, minor partly false, conclusion true. |

One premiss particular.

- | | |
|--------------------------------------|--|
| 54 ^b 21-35 | Major wholly false, minor true, conclusion true. |
| 54 ^b 35-55 ^a 4 | Major partly false, minor true, conclusion true. |
| 55 ^a 4-19 | Major true, minor wholly false, conclusion true. |
| 55 ^a 19-28 | Major partly false, minor wholly false, conclusion true. |
| 55 ^a 28- ^b 2 | Both premisses wholly false, conclusion true. |

neither let B belong to C . This is possible, e.g. animal belongs to no stone, nor stone to any man. If then A is taken to belong to all B and B to all C , A will belong to all C ; consequently though both the premisses are false the conclusion is true: for every man is an animal. Similarly ³⁵ with the negative. For it is possible that neither A nor B should belong to any C , although A belongs to all B , e.g. if the same terms are taken and man is put as middle: for neither animal nor man belongs to any stone, but animal belongs to every man.¹ Consequently if one term is taken to belong to none of that to which it does belong, and the ⁴⁰ other term is taken to belong to all of that to which it does not belong, though both the premisses are false the conclusion will be true. (2) A similar proof may be given if ⁵⁴^a each premiss is partially false.

(3) But if one only of the premisses is false, when the first premiss is wholly false, e.g. AB , the conclusion will not be true, but if the premiss BC is wholly false, a true conclusion will be possible. I mean by 'wholly false' the contrary of the truth, e.g. if what belongs to none is assumed to belong ⁵ to all, or if what belongs to all is assumed to belong to none. Let A belong to no B , and B to all C . If then the premiss BC which I take is true, and the premiss AB is wholly false, viz. that A belongs to all B , it is impossible that the conclusion should be true: for A belonged to none of the C s, since A belonged to nothing to which B belonged, and B ¹⁰ belonged to all C . Similarly there cannot be a true conclusion if A belongs to all B , and B to all C , but while the true premiss BC is assumed, the wholly false premiss AB is also assumed, viz. that A belongs to nothing to which B belongs: here the conclusion must be false. For A will belong to all C , since A belongs to everything to which B ¹⁵ belongs, and B to all C . It is clear then that when the first premiss is wholly false, whether affirmative or negative, and the other premiss is true, the conclusion cannot be true.

(4) But if the premiss is not wholly false, a true conclusion

¹ No B (men) are A (animals).
 All C (stones) are B (men).
 \therefore No C (stones) are A (animals).

is possible. For if A belongs to all C and to some B , and if B
 20 belongs to all C , e.g. animal to every swan and to some
 white thing, and white to every swan, then if we take as
 premisses that A belongs to all B , and B to all C , A will
 belong to all C truly: for every swan is an animal. Similarly
 if the statement AB is negative. For it is possible that A
 25 should belong to some B and to no C , and that B should
 belong to all C , e.g. animal to some white thing, but to no
 snow, and white to all snow. If then one should assume
 that A belongs to no B , and B to all C , then A will belong
 to no C .

(5) But if the premiss AB , which is assumed, is wholly true,
 and the premiss BC is wholly false, a true syllogism will be
 30 possible: for nothing prevents A belonging to all B and to
 all C , though B belongs to no C , e.g. these being species of
 the same genus which are not subordinate one to the other:
 for animal belongs both to horse and to man, but horse to
 no man. If then it is assumed that A belongs to all B and
 B to all C , the conclusion will be true, although the premiss
 35 BC is wholly false. Similarly if the premiss AB is negative.
 For it is possible that A should belong neither to any B nor
 to any C , and that B should not belong to any C , e.g. a genus
 to species of another genus: for animal belongs neither to
 music nor to the art of healing, nor does music belong to
 54^b the art of healing. If then it is assumed that A belongs to
 no B , and B to all C , the conclusion will be true.

(6) And if the premiss BC is not wholly false but in part
 only, even so the conclusion may be true. For nothing
 5 prevents A belonging to the whole of B and of C , while B
 belongs to some C , e.g. a genus to its species and difference:
 for animal belongs to every man and to every footed thing,
 and man to some footed things though not to all. If then
 it is assumed that A belongs to all B , and B to all C , A will
 belong to all C : and this *ex hypothesi* is true. Similarly
 10 if the premiss AB is negative. For it is possible that A
 should neither belong to any B nor to any C , though B
 belongs to some C , e.g. a genus to the species of another
 genus and its difference: for animal neither belongs to any
 wisdom nor to any instance of 'speculative', but wisdom

belongs to some instance of 'speculative'. If then it should be assumed that *A* belongs to no *B*, and *B* to all *C*, *A* will 15 belong to no *C*: and this *ex hypothesi* is true.

In particular syllogisms it is possible when the first premiss is wholly false, and the other true, that the conclusion should be true; also when the first premiss is false in part, and the other true;¹ and when the first is true, and 20 the particular is false; and when both are false. (7) For nothing prevents *A* belonging to no *B*, but to some *C*, and *B* to some *C*, e.g. animal belongs to no snow, but to some white thing, and snow to some white thing. If then² snow is taken as middle, and animal as first term, and it is assumed 25 that *A* belongs to the whole of *B*, and *B* to some *C*, then the premiss *AB* is wholly false, the premiss *BC* true, and the conclusion true. Similarly if the premiss *AB* is negative: for it is possible that *A* should belong to the whole of *B*, but not to some *C*, although *B* belongs to some *C*, 30 e.g. animal belongs to every man, but does not follow³ some white, but man belongs to some white; consequently if man be taken as middle term and it is assumed that *A* belongs to no *B* but *B* belongs to some *C*, the conclusion will be true although the premiss *AB* is wholly false.

(8) If the premiss *AB* is false in part, the conclusion may 35 be true. For nothing prevents *A* belonging both to *B* and to some *C*, and *B* belonging to some *C*, e.g. animal to something beautiful and to something great, and beautiful belonging to something great. If then *A* is assumed to belong to all *B*, and *B* to some *C*, the premiss *AB* will be partially false, the premiss *BC* will be true, and the con- 55^aclusion true. Similarly if the premiss *AB* is negative. For the same terms will serve, and in the same positions, to prove the point.⁴

(9) Again if the premiss *AB* is true, and the premiss *BC* is false, the conclusion may be true. For nothing prevents *A* 5 belonging to the whole of *B* and to some *C*, while *B* belongs

¹ Omit *ἐλγς* in l. 20 with A, B, C, and Waitz.

² *οὐ* in l. 24 (Bekker) is a misprint for *οὐν*.

³ See note 43^b 3.

⁴ viz. that a true conclusion may follow if one premiss is partially false, the other true.

to no *C*, e. g. animal to every swan and to some black things, though swan belongs to no black thing. Consequently if it should be assumed that *A* belongs to all *B*, and *B* to some *C*,
 10 the conclusion will be true, although the statement *BC* is false. Similarly if the premiss *AB* is negative. For it is possible that *A* should belong to no *B*, and not to some *C*, while *B* belongs to no *C*, e. g. a genus to the species of another genus and to the accident of its own species: for
 15 animal belongs to no number and not to some white things,¹ and number belongs to nothing white. If then number is taken as middle, and it is assumed that *A* belongs to no *B*, and *B* to some *C*, then *A* will not belong to some *C*, which *ex hypothesi* is true. And the premiss *AB* is true, the premiss *BC* false.

(10) Also if the premiss *AB* is partially false, and the pre-
 20 miss *BC* is false too, the conclusion may be true. For nothing prevents *A* belonging to some *B* and to some *C*, though *B* belongs to no *C*, e. g. if *B* is the contrary of *C*, and both are accidents of the same genus: for animal belongs to some white things and to some black things, but white belongs to
 25 no black thing. If then it is assumed that *A* belongs to all *B*, and *B* to some *C*, the conclusion will be true. Similarly if the premiss *AB* is negative: for the same terms arranged in the same way will serve for the proof.

(11) Also though both premisses are false the conclusion may be true. For it is possible that *A* may belong to no *B*
 30 and to some *C*, while *B* belongs to no *C*, e. g. a genus in relation to the species of another genus, and to the accident of its own species: for animal belongs to no number, but to some white things, and number to nothing white. If then it is assumed that *A* belongs to all *B* and *B* to some *C*, the
 35 conclusion will be true, though both premisses are false. Similarly also if the premiss *AB* is negative. For nothing prevents *A* belonging to the whole of *B*, and not to some *C*, while *B* belongs to no *C*, e. g. animal belongs to every swan,

¹ Read in l. 15 τινὶ οὐδ', which seems to have been read by Phil.

No *B* (number) is *A* (animal). (True.)

Some *C* (white) is *B* (number). (False.)

∴ Some *C* (white) is not *A* (animal). (True.)

and not to some black things, and swan belongs to nothing black. Consequently if it is assumed that *A* belongs to 40 no *B*, and *B* to some *C*, then *A* does not belong to some *C*. 55^b The conclusion then is true, but the premisses are false.

- 3 In the middle figure it is possible in every way to reach a true conclusion through false premisses, whether the syllogisms are universal or particular, viz. when both premisses are wholly false; when each is partially false; when one 5 is true, the other wholly false (it does not matter which of the two premisses is false); if both premisses are partially false; if one is quite true, the other partially false; if one is wholly false, the other partially true.¹ For (1) if *A* belongs 10 to no *B* and to all *C*, e. g. animal to no stone and to every horse, then if the premisses are stated contrariwise and it is assumed that *A* belongs to all *B* and to no *C*, though the premisses are wholly false they will yield a true conclusion.

¹ The possible combinations of premisses in which there is some element of falsity are:

- (1) Wholly false with wholly false.
- (2) True with wholly false.
- (3) Partly false with partly false.
- (4) True with partly false.
- (5) Wholly false with partly false.

ἐπὶ τι ἑκατέρως seems, in the light of 56^b 20-33, to mean the third (and not the fifth) of these cases, which is also expressed by *καὶ εἰ ἀμφότεραι ἐπὶ τι ψευδεῖς*. Waitz would excise the latter clause for this reason, and *καὶ εἰ ἡ μὲν ὅλη ψευδὴς ἢ δ' ἐπὶ τι ἀληθὴς* because (*αἱ ἐπὶ τι ἀληθὴς* does not occur elsewhere in Aristotle, (b) it must mean either (i) the same as 'partly false', so that case (5) is meant, a case entirely ignored by Aristotle throughout cc. 2-4, and therefore not to be expected here, or (ii) something else, in which case Aristotle illogically omits all the other combinations which include one 'partly true' premiss.

To (a) it may be replied that *ἐπὶ τι ἀληθὴς* is justified by the use of its opposite *ἀπλῶς ἀληθὴς* l. 7, which Waitz does not reject (cf. *ὅλη ἀληθὴς* l. 17, &c.). To (b) it may be replied that the clause plainly does indicate case (5) and that this case is expressly dealt with in the discussion of the first figure, 55^a 19-28. It is true that this case is omitted in the detailed discussion of the second figure, where with reference to universal syllogisms (1) is discussed in 55^b 10-16, (2) in 55^b 16-23, (4) in 55^b 23-38, (3) in 55^b 38-56^a 4, and with reference to particular syllogisms (2) is discussed in 56^a 5-32, (1) in 56^a 32-^b 3. But similarly (3) is omitted in the discussion of particular syllogisms in the first figure. Aristotle does not attempt to work out all the possibilities.

There remains the repetition involved in *ἐπὶ τι ἑκατέρως* and *εἰ ἀμφότεραι ἐπὶ τι ψευδεῖς*. It is quite possible that through confusion Aristotle wrote the passage as it stands; if anything is to go it seems better to excise *ἐπὶ τι ἑκατέρως* as introduced by imitation of c. 4, 56^b 5.

15 Similarly if *A* belongs to all *B* and to no *C*: for we shall have the same syllogism.

(2) Again if one premiss is wholly false, the other wholly true: for nothing prevents *A* belonging to all *B* and to all *C*, though *B* belongs to no *C*, e.g. a genus to its co-ordinate species. For animal belongs to every horse and man, and
20 no man is a horse. If then it is assumed that animal belongs to all of the one, and none of the other, the one premiss will be wholly false, the other wholly true, and the conclusion will be true whichever term the negative statement concerns.

(3) Also if one premiss is partially false, the other wholly true. For it is possible that *A* should belong to some *B*
25 and to all *C*, though *B* belongs to no *C*, e.g. animal to some white things and to every raven, though white belongs to no raven. If then it is assumed that *A* belongs to no *B*, but to the whole of *C*, the premiss *AB* is partially false, the premiss *AC* wholly true, and the conclusion true. Similarly
30 if the negative statement is transposed:¹ the proof can be made by means of the same terms. Also if the affirmative premiss is partially false, the negative wholly true, a true conclusion is possible. For nothing prevents *A* belonging to some *B*, but not to *C* as a whole,² while *B* belongs to no *C*, e.g. animal belongs to some white things, but to no
35 pitch, and white belongs to no pitch. Consequently if it is assumed that *A* belongs to the whole of *B*, but to no *C*, the premiss *AB* is partially false, the premiss *AC* is wholly true, and the conclusion is true.

(4) And if both the premisses are partially false, the conclusion may be true. For it is possible that *A* should
40 belong to some *B* and to some *C*, and *B* to no *C*, e.g. animal to some white things and to some black things, though white
56^a belongs to nothing black. If then it is assumed that *A* belongs to all *B* and to no *C*, both premisses are partially false, but the conclusion is true. Similarly, if the negative premiss is transposed, the proof can be made by means of the same terms.

¹ i.e. treated as minor instead of major premiss.

² i.e. not to any *C*.

It is clear also that our thesis holds in particular syllo-⁵gisms. For (5) nothing prevents *A* belonging to all *B* and to some *C*, though *B* does not belong to some *C*, e.g. animal to every man and to some white things, though man will not belong to some white things. If then it is stated that *A* belongs to no *B* and to some *C*, the universal premiss is ¹⁰ wholly false, the particular premiss is true, and the conclusion is true. Similarly if the premiss *AB* is affirmative: for it is possible that *A* should belong to no *B*, and not to some *C*, though *B* does not belong to some *C*, e.g. animal belongs to nothing lifeless, and does not belong to some white things, and lifeless will not belong to some white ¹⁵ things.¹ If then it is stated that *A* belongs to all *B* and not to some *C*, the premiss *AB* which is universal is wholly false, the premiss *AC* is true, and the conclusion is true. Also a true conclusion is possible when the universal premiss is true, and the particular is false. For nothing prevents *A* following² neither *B* nor *C* at all, while *B* does not belong to ²⁰ some *C*, e.g. animal belongs to no number nor to anything lifeless, and number does not follow some lifeless things. If then it is stated that *A* belongs to no *B* and to some *C*, the conclusion will be true, and the universal premiss true, but the particular false. Similarly if the premiss which is ²⁵ stated universally is affirmative. For it is possible that *A* should belong both to *B* and to *C* as wholes, though *B* does not follow some *C*, e.g. a genus in relation to its species and difference: for animal follows every man and footed things as a whole, but man does not follow every footed thing. Consequently if it is assumed that *A* belongs to the whole of *B*, but does not belong to some *C*, the universal ³⁰ premiss is true, the particular false, and the conclusion true.

(6) It is clear too that though both premisses are false they may yield a true conclusion, since it is possible that *A*

¹ Read οὐ for οὐκ ὑπάρχει in l. 15 with C₂. The sense requires a negative, though this has little MS. support.

All *B* (lifeless) is *A* (animal). (False.)

Some *C* (white) is not *A* (animal). (True.)

∴ Some *C* (white) is not *B* (lifeless). (True.)

² See note 43^b 3.

should belong both to *B* and to *C* as wholes,¹ though *B*
 35 does not follow some *C*. For if it is assumed that *A* belongs
 to no *B* and to some *C*, the premisses are both false, but the
 conclusion is true. Similarly if the universal premiss is
 affirmative and the particular negative. For it is possible
 that *A* should follow no *B* and all *C*, though *B* does not
 40 belong to some *C*, e.g. animal follows no science but every
 man, though science does not follow every man. If then *A*
 56^b is assumed to belong to the whole of *B*, and not to follow
 some *C*, the premisses are false but the conclusion is true.

In the last figure a true conclusion may come through 4
 5 what is false, alike when both premisses are wholly false,
 when each is partly false, when one premiss is wholly true,
 the other false, when one premiss is partly false, the other
 wholly true, and vice versa, and in every other way in which it
 is possible to alter the premisses.² For (1) nothing prevents
 10 neither *A* nor *B* from belonging to any *C*, while *A* belongs
 to some *B*, e.g. neither man nor footed follows anything
 lifeless, though man belongs to some footed things. If then
 it is assumed that *A* and *B* belong to all *C*, the premisses
 will be wholly false, but the conclusion true. Similarly if
 one premiss is negative, the other affirmative. For it is
 15 possible that *B* should belong to no *C*, but *A* to all *C*, and that
A should not belong to some *B*, e.g. black belongs to no
 swan, animal to every swan, and animal not to everything
 black. Consequently if it is assumed that *B* belongs to

¹ The sense requires something like the reading implied in l. 34 by
 Boethius' translation, viz. τῷ μὲν ὅλῳ τῷ δὲ μηδενί, in place of ὅλῳ.

No *B* is *A*. (False.)

Some *C* is *A*. (False.)

∴ Some *C* is not *B*. (True.)

But the confusion may be in Aristotle.

² The following cases are discussed in the sequel :

Both premisses universal.

56^b 9-20 Both premisses wholly false, conclusion true.

56^b 20-33 Both premisses partly false, conclusion true.

56^b 33-57* 9 One premiss true, the other wholly false, conclusion
 true.

57* 9-28 One premiss true, the other partly false, conclusion
 true.

One premiss particular.

57* 29-35 Same situation as when both premisses are universal.

all *C*, and *A* to no *C*, *A* will not belong to some *B*: and the conclusion is true, though the premisses are false. 10

(2) Also if each premiss is partly false, the conclusion may be true. For nothing prevents both *A* and *B* from belonging to some *C* while *A* belongs to some *B*, e.g. white and beautiful belong to some animals, and white to some beautiful things. If then it is stated that *A* and *B* belong to all *C*, the premisses are partially false, but the conclusion 15 is true. Similarly if the premiss *AC* is stated as negative. For nothing prevents *A* from not belonging, and *B* from belonging, to some *C*, while *A* does not belong to all *B*, e.g. white does not belong to some animals, beautiful belongs to some animals, and white does not belong to 30 everything beautiful. Consequently if it is assumed that *A* belongs to no *C*, and *B* to all *C*, both premisses are partly false, but the conclusion is true.

(3) Similarly if one of the premisses assumed is wholly false, the other wholly true. For it is possible that both *A* and *B* should follow all *C*, though *A* does not belong to some *B*, 35 e.g. animal and white follow every swan, though animal does not belong to everything white. Taking these then as terms, if one assumes that *B* belongs to the whole of *C*, but *A* does not belong to *C* at all, the premiss *BC* will be wholly true, the premiss *AC* wholly false, and the conclusion true. Similarly if the statement *BC* is false, the 40 statement *AC* true, the conclusion may be true. The same terms will serve for the proof.¹ Also if both the 57^a premisses assumed are affirmative, the conclusion may be true. For nothing prevents *B* from following all *C*, and *A* from not belonging to *C* at all, though *A* belongs to some *B*, e.g. animal belongs to every swan,² black to no swan, and black to some animals. Consequently if it is 5 assumed that *A* and *B* belong to every *C*, the premiss *BC* is wholly true, the premiss *AC* is wholly false, and the conclu-

¹ 'Black—swan—lifeless', which follow in the MSS. at l. 1, are not 'the same terms', and owe their origin to the (lost) commentary of Alexander, who saw that 'the same terms'—animal, white, swan—will not serve Aristotle's turn—i.e. if they are as before respectively major, minor, and middle term.

² Omit *μεν* in l. 4 with B and Waitz.

sion is true. Similarly if the premiss AC which is assumed is true: the proof can be made through the same terms.

(4) Again if one premiss is wholly true, the other partly false, the conclusion may be true. For it is possible that B should belong to all C , and A to some C , while A belongs to some B , e.g. biped belongs to every man, beautiful not to every man, and beautiful to some bipeds. If then it is assumed that both A and B belong to the whole of C , the premiss BC is wholly true, the premiss AC partly false, the conclusion true. Similarly if of the premisses assumed AC is true and BC partly false, a true conclusion is possible: this can be proved, if the same terms as before are transposed. Also the conclusion may be true if one premiss is negative, the other affirmative. For since it is possible that B should belong to the whole of C , and A to some C , and, when they are so, that A should not belong to all B , therefore if it is assumed that B belongs to the whole of C , and A to no C , the negative premiss is partly false, the other premiss wholly true, and the conclusion is true. Again since it has been proved that if A belongs to no C and B to some C , it is possible that A should not belong to some C , it is clear that if the premiss AC is wholly true, and the premiss BC partly false, it is possible that the conclusion should be true. For if it is assumed that A belongs to no C , and B to all C , the premiss AC is wholly true, and the premiss BC is partly false.

(5) It is clear also in the case of particular syllogisms¹ that a true conclusion may come through what is false, in every possible way. For the same terms must be taken as have been taken when the premisses are universal, positive terms in positive syllogisms, negative terms in negative. For it makes no difference to the setting out of the terms, whether one assumes that what belongs to none belongs to all or that what belongs to some belongs to all. The same applies to negative statements.

It is clear then that if the conclusion is false, the premisses of the argument must be false, either all or some of them; but when the conclusion is true, it is not necessary

¹ i.e. syllogisms having one premiss particular.

that the premisses should be true, either one or all, yet it is possible, though no part of the syllogism is true, that the conclusion may none the less be true; but it is not necessitated. The reason is that when two things are so related 40 to one another, that if the one is, the other necessarily is, then if the latter is not, the former will not be either, but if the latter is, it is not necessary that the former should be. But it is impossible that the same thing should be necessitated by the being and by the not-being of the same thing. I mean, for example, that it is impossible that *B* should necessarily be great since *A* is white and that *B* 5 should necessarily be great since *A* is not white. For whenever since this, *A*, is white it is necessary that that, *B*, should be great, and since *B* is great that *C* should not be white, then it is necessary if *A* is white that *C* should not be white. And whenever it is necessary, since one of two things is, that the other should be, it is necessary, if the 10 latter is not, that the former (viz. *A*) should not be. If then *B* is not great *A* cannot be white. But if, when *A* is not white, it is necessary that *B* should be great, it necessarily results that if *B* is not great, *B* itself is great. (But this is impossible.) For if *B* is not great, *A* will necessarily not be white. If then when this is not white *B* must be 15 great, it results that if *B* is not great, it is great, just as if it were proved through three terms.

- 5 Circular and reciprocal proof means proof by means of the conclusion, i. e. by converting one of the premisses simply and inferring the other premiss which was assumed 20 in the original syllogism:¹ e.g. suppose it has been necessary to prove that *A* belongs to all *C*, and it has been proved through *B*; suppose that *A* should now be proved to belong to *B* by assuming that *A* belongs to *C*, and *C* to *B*—so *A* belongs to *B*: but in the first syllogism the converse was assumed, viz. that *B* belongs 25 to *C*. Or suppose it is necessary to prove that *B* belongs to *C*, and *A* is assumed to belong to *C*, which was the conclusion of the first syllogism, and *B* to belong to *A*: but the converse was assumed in the earlier syllogism,

¹ The sentence would be clearer if we could read *λαβεῖν* in l. 20.

viz. that *A* belongs to *B*. In no other way is reciprocal proof possible. If another term is taken as middle, the
 30 proof is not circular: for neither of the propositions assumed is the same as before: if one of the accepted terms is taken as middle, only one of the premisses of the first syllogism can be assumed in the second: for if both of them are taken the same conclusion as before will result: but it must be different. If the terms are not convertible, one of the premisses from which the syllogism results must be undemonstrated: for it is not possible to demonstrate through these terms that the third belongs to the middle
 35 or the middle to the first. If the terms are convertible, it is possible to demonstrate everything reciprocally, e. g. if *A* and *B* and *C* are convertible with one another. Suppose the proposition *AC* has been demonstrated through *B* as middle term, and again the proposition *AB* through the conclusion and the premiss *BC* converted, and similarly the
 40 proposition *BC* through the conclusion and the premiss *AB* 58^a converted. But it is necessary to prove both the premiss *CB*, and the premiss *BA*: for we have used these alone without demonstrating them. If then it is assumed that *B* belongs to all *C*, and *C* to all *A*, we shall have a syllogism
 5 relating *B* to *A*. Again if it is assumed that *C* belongs to all *A*, and *A* to all *B*, *C* must belong to all *B*. In both these syllogisms the premiss *CA* has been assumed without being demonstrated: the other premisses had *ex hypothesi* been proved. Consequently if we succeed in demonstrating this premiss, all the premisses will have been proved
 10 reciprocally. If then it is assumed that *C* belongs to all *B*, and *B* to all *A*, both the premisses assumed have been proved, and *C* must belong to *A*. It is clear then that only if the terms are convertible is circular and reciprocal demonstration possible (if the terms are not convertible,
 15 the matter stands as we said above). But it turns out in these also that we use for the demonstration the very thing that is being proved: for *C* is proved of *B*, and *B* of *A*, by assuming that *C* is said of *A*, and *C* is proved of *A* through these premisses, so that we use the conclusion for
 20 the demonstration.

In negative syllogisms reciprocal proof is as follows. Let *B* belong to all *C*, and *A* to none of the *B*s: we conclude that *A* belongs to none of the *C*s. If again it is necessary to prove that *A* belongs to none of the *B*s (which was previously assumed) *A* must belong to no *C*, and *C* to all *B*:²⁵ thus the previous premiss is reversed. If it is necessary to prove that *B* belongs to *C*, the proposition *AB* must no longer be converted as before: for the premiss '*B* belongs to no *A*' is identical with the premiss '*A* belongs to no *B*'. But we must assume that *B* belongs to all of that to none of which *A* belongs. Let *A* belong to none of the *C*s (which³⁰ was the previous conclusion) and assume that *B* belongs to all of that to none of which *A* belongs. It is necessary then that *B* should belong to all *C*. Consequently each of the three propositions has been made a conclusion, and this is circular demonstration, to assume the conclusion and the converse of one of the premisses, and deduce the remaining³⁵ premiss.

In particular syllogisms it is not possible to demonstrate the universal premiss through the other propositions, but the particular premiss can be demonstrated. Clearly it is impossible to demonstrate the universal premiss: for what is universal is proved through propositions which are universal, but the conclusion is not universal, and the proof⁴⁰ must start from the conclusion and the other premiss. Further a syllogism cannot be made at all if the other premiss is converted: for the result is that both premisses^{58^b} are particular. But the particular premiss may be proved. Suppose that *A* has been proved of some *C* through *B*. If then it is assumed that *B* belongs to all *A*, and the conclusion is retained, *B* will belong to some *C*: for we obtain the 5 first figure and *A* is middle. But if the syllogism is negative, it is not possible to prove the universal premiss, for the reason¹ given above. But it is possible to prove the particular premiss, if the proposition *AB* is converted as in the universal syllogism,² i. e. '*B* belongs to some of that to 10

¹ Read δι' ὅ in l. 7 with Buhle.

² Cf. * 29. Omit with A, B, and Waitz in l. 8 μὲν and in l. 9 οὐκ ἔστι, διὰ προσλήψεως δ' ἔστιν.

some of which *A* does not belong': otherwise no syllogism results because the particular premiss is negative.

In the second figure it is not possible to prove an affirmative proposition in this way, but a negative proposition
 15 may be proved. An affirmative proposition is not proved because both premisses of the new syllogism are not affirmative (for the conclusion is negative) but an affirmative proposition is (as we saw) proved from premisses which are both affirmative. The negative is proved as follows. Let
A belong to all *B*, and to no *C*: we conclude that *B* belongs
 20 to no *C*. If then it is assumed that *B* belongs to all *A*,¹ it is necessary that *A* should belong to no *C*: for we get the second figure, with *B* as middle. But if the premiss *AB* was negative, and the other affirmative, we shall have the first figure. For *C* belongs to all *A*, and *B* to no *C*,
 25 consequently *B* belongs to no *A*: neither then does *A* belong to *B*. Through the conclusion, therefore, and one premiss, we get no syllogism, but if another premiss is assumed in addition, a syllogism will be possible. But if the syllogism is not universal, the universal premiss cannot be proved, for the same reason as we gave above,² but
 30 the particular premiss can be proved whenever the universal statement is affirmative. Let *A* belong to all *B*, and not to all *C*: the conclusion is *BC*. If then it is assumed that *B* belongs to all *A*, but not to all *C*, *A* will not belong to some *C*, *B* being middle. But if the universal premiss is *negative*, the premiss *AC* will not be demonstrated by the conversion
 35 of *AB*: for it turns out that either both or one of the premisses is negative; consequently a syllogism will not be possible. But the proof will proceed as in the universal syllogisms,³ if it is assumed that *A* belongs to some of that to some of which *B* does not belong.

In the third figure, when both premisses are taken
 40 universally, it is not possible to prove them reciprocally: for that which is universal is proved through statements which
 59^a are universal, but the conclusion in this figure is always

¹ Omit τῶ δὲ Γ μὴδενί in l. 20 with A, B, and Waitz.

² * 38.

³ Cf. * 29.

particular, so that it is clear that it is not possible at all to prove through this figure the universal premiss. But if one premiss is universal, the other particular, proof of the latter will sometimes be possible, sometimes not. When both the premisses assumed are affirmative, and the universal concerns the minor extreme, proof will be possible, but when it concerns the other extreme, impossible. Let A belong to all C and B to some C : the conclusion is the statement AB . If then it is assumed that C belongs to all A , it has been proved that C belongs to some B , but that B belongs to some C has not been proved. And yet it is necessary, if C belongs to some B , that B should belong to some C . But it is not the same that this should belong to that, and that to this: but we must assume besides that if this belongs to some of that, that belongs to some of this. But if this is assumed the syllogism no longer results from the conclusion and the other premiss. But if B belongs to all C , and A to some C , it will be possible to prove the proposition AC , when it is assumed that C belongs to all B , and A to some B . For if C belongs to all B and A to some B , it is necessary that A should belong to some C , B being middle. And whenever one premiss is affirmative, the other negative, and the affirmative is universal, the other premiss can be proved. Let B belong to all C , and A not to some C : the conclusion is that A does not belong to some B . If then it is assumed further that C belongs to all B , it is necessary that A should not belong to some C , B being middle. But when the negative premiss is universal, the other premiss is not proved, except as before,¹ viz. if it is assumed that *that* belongs to some of that, to some of which *this* does not belong, e.g. if A belongs to no C , and B to some C : the conclusion is that A does not belong to some C . If then it is assumed that C belongs to some of that to some of which A does not belong, it is necessary that C should belong to some of the B s. In no other way is it possible by converting the universal premiss to prove the other: for in no other way can a syllogism be formed.

It is clear then that in the first figure reciprocal proof is

¹ 58^b9.

made both through the third and through the first figure—if the conclusion is affirmative through the first; if the conclusion is negative through the last. For it is assumed that *that* belongs to all of that to none of which *this* belongs. In the middle figure, when the syllogism is universal, proof is possible through the second figure and through the first, but when particular through the second and the last. In the third figure all proofs are made through itself. It is clear also that in the third figure and in the middle figure those syllogisms which are not made through those figures themselves¹ either are not of the nature of circular proof or are imperfect.

59^b To convert a syllogism means to alter the conclusion and make another syllogism to prove that either the extreme² cannot belong to the middle or the middle to the last³ term. For it is necessary, if the conclusion has been changed into its opposite and one of the premisses stands, that the other premiss should be destroyed. For if it should stand, the conclusion also must stand. It makes a difference whether the conclusion is converted into its contradictory or into its contrary. For the same syllogism does not result whichever form the conversion takes. This will be made clear by the sequel. By contradictory opposition I mean the opposition of 'to all' to 'not to all', and of 'to some' to 'to none'; by contrary opposition I mean the opposition of 'to all' to 'to none', and of 'to some' to 'not to some'. Suppose that *A* has been proved of *C*, through *B* as middle term. If then it should be assumed that *A* belongs to no *C*, but to all *B*, *B* will belong to no *C*. And if *A* belongs to no *C*, and *B* to all *C*, *A* will belong, not to no *B* at all, but not to all *B*. For (as we saw) the universal is not proved through the last figure.⁴ In a word it is not possible to refute universally by conversion the premiss which concerns the major extreme: for the refutation always proceeds through the third figure; since it is necessary to take both premisses in reference to the minor extreme. Similarly if the syllogism is negative.

¹ Cf. 58^b 22–7, 59^a 6–14.² Major term.³ Minor.⁴ i. 6.

Suppose it has been proved that *A* belongs to no *C* through *B*. Then if it is assumed that *A* belongs to all *C*, and to no *B*, *B* will belong to none of the *C*s. And if *A* and *B* belong to all *C*, *A* will belong to some *B*: but in the original premiss it belonged to no *B*.

If the conclusion is converted into its contradictory, the ²⁵ syllogisms will be contradictory and not universal. For one premiss is particular, so that the conclusion also will be particular. Let the syllogism be affirmative, and let it be converted as stated. Then if *A* belongs not to all *C*, but to all *B*, *B* will belong not to all *C*. And if *A* belongs not ³⁰ to all *C*, but *B* belongs to all *C*, *A* will belong not to all *B*. Similarly if the syllogism is negative. For if *A* belongs to some *C*, and to no *B*, *B* will belong, not to no *C* at all, but —not to some *C*. And if *A* belongs to some *C*, and *B* to all *C*, as was originally assumed, *A* will belong to some *B*. ³⁵

In particular syllogisms when the conclusion is converted into its contradictory, both premisses may be refuted, but when it is converted into its contrary, neither. For the result is no longer, as in the universal syllogisms,¹ ⁴⁰ a refutation in which the conclusion reached by conversion lacks universality, but no refutation at all. Suppose that *A* ^{60^a} has been proved of some *C*. If then it is assumed that *A* belongs to no *C*, and *B* to some *C*, *A* will not belong to some *B*: and if *A* belongs to no *C*, but to all *B*, *B* will belong to no *C*. Thus both premisses are refuted. But neither can be refuted if the conclusion is converted into its contrary. ⁵ For if *A* does not belong to some *C*, but to all *B*, then *B* will not belong to some *C*. But the original premiss is not yet refuted: for it is possible that *B* should belong to some *C*, and should not belong to some *C*. The universal premiss *AB* cannot be affected by a syllogism at all: for if *A* does ¹⁰ not belong to some of the *C*s, but *B* belongs to some of the *C*s, neither of the premisses is universal. Similarly if the syllogism is negative: for if it should be assumed that *A* belongs to all *C*, both premisses are refuted: but if the assumption is that *A* belongs to some *C*, neither premiss is refuted. The proof is the same as before.

¹ II. 13-20, 23-4.

15 In the second figure it is not possible to refute the premiss ξ which concerns the major extreme by establishing something *contrary* to it, whichever form the conversion of the conclusion may take. For the conclusion of the refutation will always be in the third figure, and in this figure (as we saw ¹) there is no universal syllogism. The other premiss can be refuted in a manner similar to the conversion: I mean, if the conclusion of
 20 the first syllogism is converted into its contrary, the conclusion of the refutation will be the contrary of the minor premiss of the first, if into its contradictory, the contradictory. Let A belong to all B and to no C : conclusion BC . If then it is assumed that B belongs to *all* C , and the proposition AB stands, A will belong to all C , since the first figure is pro-
 25 duced. If B belongs to all C , and A to no C , then A belongs not to all B : the figure is the last. But if the conclusion BC is converted into its *contradictory*, the premiss AB will be refuted as before,² the premiss AC by its contradictory. For if B belongs to some C , and A to no C , then A will not belong to some B . Again if B belongs to some C , and A to
 30 all B , A will belong to some C , so that the syllogism results in the contradictory of the minor premiss. A similar proof can be given if the premisses are transposed in respect of their quality.

If the syllogism is particular, when the conclusion is converted into its *contrary* neither premiss can be refuted, as also happened in the first figure,³ but if the conclusion is
 35 converted into its contradictory, both premisses can be refuted. Suppose that A belongs to no B , and to some C : the conclusion is BC . If then it is assumed that B belongs to some C , and the statement AB stands, the conclusion will be that A does not belong to some C . But the original statement has not been refuted: for it is possible that A should belong to some C and also not to some C . Again if
 40 B belongs to some C and A to some C , no syllogism will be possible: for neither of the premisses taken is universal.
 60^b Consequently the proposition AB is not refuted. But if the conclusion is converted into its *contradictory*, both

¹ i. 6.² i. e. by its contradictory.³ 59^b 39-60^a 1, 60^a 5-14.

premises can be refuted. For if *B* belongs to all *C*, and *A* to no *B*, *A* will belong to no *C*: but it was assumed to belong to some *C*. Again if *B* belongs to all *C* and *A* to some *C*, *A* will belong to some *B*. The same proof can be given if the universal statement is affirmative. 5

- ο In the third figure when the conclusion is converted into its *contrary*, neither of the premisses can be refuted in any of the syllogisms, but when the conclusion is converted into its *contradictory*, both premisses may be refuted and in all the moods. Suppose it has been proved that *A* belongs to some *B*, *C* being taken as middle, and the premisses being 10 universal. If then it is assumed that *A* does not belong to some *B*, but *B* belongs to all *C*, no syllogism is formed about *A* and *C*. Nor if *A* does not belong to some *B*, but belongs to all *C*, will a syllogism be possible about *B* and *C*. A similar proof can be given if the premisses are not universal. 15 For either both premisses arrived at by the conversion must be particular, or the universal premiss must refer to the minor extreme. But we found that no syllogism is possible thus either in the first or in the middle figure.¹ But if the conclusion is converted into its *contradictory*, both the premisses² can be refuted. For if *A* belongs to no *B*, and 20 *B* to all *C*, then *A* belongs to no *C*: again if *A* belongs to no *B*, and to all *C*, *B* belongs to no *C*. And similarly if one of the premisses is not universal. For if *A* belongs to no *B*, and *B* to some *C*, *A* will not belong to some *C*: if *A* belongs to no *B*, and to all *C*, *B* will belong to no *C*. 25

Similarly if the original syllogism is negative. Suppose it has been proved that *A* does not belong to some *B*, *BC* being affirmative, *AC* being negative: for it was thus that, as we saw,³ a syllogism could be made. Whenever then the *contrary* of the conclusion is assumed a syllogism will not be possible. For if *A* belongs to some *B*, and *B* to all *C*, 30 no syllogism is possible (as we saw⁴) about *A* and *C*. Nor, if *A* belongs to some *B*, and to no *C*, was a syllogism

¹ 26^a 17-21, 27^a 4-12.

² Read ἀντιστρέφεται in l. 19 (which Phil. seems to have read), and place the comma before αὐτοπόρου with Waitz.

³ 28^b 1-4, 15-29^a 10.

⁴ 26^a 30-6.

possible concerning *B* and *C*.¹ Therefore the premisses are not refuted. But when the *contradictory* of the conclusion is assumed, they are refuted. For if *A* belongs to all *B*, and
 35 *B* to *C*, *A* belongs to all *C*: but *A* was supposed originally to belong to no *C*. Again if *A* belongs to all *B*, and to no *C*, then *B* belongs to no *C*: but it was supposed to belong to all *C*. A similar proof is possible if the premisses are not universal. For *AC* becomes universal and negative, the other premiss particular and affirmative. If then *A* belongs
 40 to all *B*, and *B* to some *C*, it results that *A* belongs to some *C*: but it was supposed to belong to no *C*. Again if *A*
 61^a belongs to all *B*, and to no *C*, then *B* belongs to no *C*: but it was assumed to belong to some *C*. If *A* belongs to some *B* and *B* to some *C*, no syllogism results: nor yet if *A* belongs to some *B*, and to no *C*. Thus in one way the premisses are refuted, in the other way they are not.

5 From what has been said it is clear how a syllogism results in each figure when the conclusion is converted; when a result contrary to the premiss, and when a result contradictory to the premiss, is obtained. It is clear that in the first figure² the syllogisms are formed through the middle and the last figures, and the premiss which concerns
 10 the minor extreme is always refuted through the middle figure, the premiss which concerns the major through the last figure. In the second figure syllogisms proceed through the first and the last figures, and the premiss which concerns the minor extreme is always refuted through the first figure, the premiss which concerns the major extreme through the last. In the third figure the refutation proceeds through the first and the middle figures; the premiss which
 15 concerns the major is always refuted through the first figure, the premiss which concerns the minor through the middle figure.

It is clear then what conversion is, how it is effected in each figure, and what syllogism results. The syllogism *per impossibile* is proved when the contradictory of the con-
 20 clusion is stated and another premiss is assumed; it can be

¹ 27^b 6-8.

² i.e. in refutation of the premisses of a syllogism in the first figure.

made in all the figures. For it resembles conversion, differing only in this: conversion takes place after a syllogism has been formed and both the premisses have been taken, but a reduction to the impossible takes place not because the contradictory has been agreed to already, but because it is ²⁵ clear that it is true.¹ The terms are alike in both, and the premisses of both are taken in the same way. For example if *A* belongs to all *B*, *C* being middle, then if it is supposed that *A* does not belong to all *B* or belongs to no *B*, but to all *C* (which was admitted to be true), it follows that *C* belongs to no *B* or not to all *B*. But this is impossible: ³⁰ consequently the supposition is false: its contradictory then is true. Similarly in the other figures: for whatever moods admit of conversion admit also of the reduction *per impossibile*.

All the problems can be proved *per impossibile* in all the figures, excepting the universal affirmative, which is proved ³⁵ in the middle and third figures, but not in the first. Suppose that *A* belongs not to all *B*, or to no *B*, and take besides another premiss concerning either of the terms, viz. that *C* belongs to all *A*, or that *B* belongs to all *D*; thus we get the first figure. If then it is supposed that *A* does not ⁴⁰ belong to all *B*, no syllogism results whichever term the assumed premiss concerns; but if it is supposed that *A* ^{61^b} belongs to no *B*, when the premiss *BD* is assumed as well we shall prove syllogistically what is false, but not the problem proposed. For if *A* belongs to no *B*, and *B* belongs to all *D*, *A* belongs to no *D*. Let this be impossible: it is ⁵ false then that *A* belongs to no *B*. But the universal affirmative is not necessarily true if the universal negative is false. But if the premiss *CA* is assumed as well, no syllogism results, nor does it do so when it is supposed that *A* does not belong to all *B*. Consequently it is clear that the universal affirmative cannot be proved in the first figure *per impossibile*.

¹ i.e. in conversion we explicitly assume one premiss and the opposite of the conclusion, and thus form a syllogism; in reduction *ad impossibile* we need not explicitly assume the original premiss which is the opposite of the conclusion of the new syllogism; we may treat its truth as obvious.

10 But the particular affirmative and the universal and particular negatives can all be proved. Suppose that *A* belongs to no *B*, and let it have been assumed that *B* belongs to all or to some *C*. Then it is necessary that *A* should belong to no *C* or not to all *C*. But this is impossible (for let it be true and clear that *A* belongs to all *C*):¹ consequently if
 15 this is false, it is necessary that *A* should belong to some *B*. But if the other premiss assumed relates to *A*, no syllogism will be possible. Nor can a conclusion be drawn when the contrary of the conclusion is supposed, e.g. that *A* does not belong to some *B*. Clearly then we must suppose the contradictory.

Again suppose that *A* belongs to some *B*, and let it have
 20 been assumed that *C* belongs to all *A*. It is necessary then that *C* should belong to some *B*. But let this be impossible, so that the supposition is false: in that case it is true that *A* belongs to no *B*. We may proceed in the same way if the proposition *CA* has been taken as negative. But if the premiss assumed concerns *B*, no syllogism will be possible. If the contrary is supposed, we shall have a syllogism and
 25 an impossible conclusion, but the problem in hand is not proved. Suppose that *A* belongs to all *B*, and let it have been assumed that *C* belongs to all *A*. It is necessary then that *C* should belong to all *B*. But this is impossible, so that it is false that *A* belongs to all *B*. But we have not yet shown it to be necessary that *A* belongs to no *B*, if it
 30 does not belong to all *B*. Similarly if the other premiss taken concerns *B*; we shall have a syllogism and a conclusion which is impossible, but the hypothesis is not refuted. Therefore it is the *contradictory* that we must suppose.

To prove that *A* does not belong to all *B*, we must suppose
 . that it belongs to all *B*: for if *A* belongs to all *B*, and *C* to
 35 all *A*, then *C* belongs to all *B*; so that if this is impossible, the hypothesis is false. Similarly if the other premiss assumed concerns *B*. The same results if the original proposition *CA* was negative: for thus also we get a syllogism. But if the negative proposition concerns *B*,

¹ Read *ἔστω* . . . A ll. 13, 14 in brackets, and omit the comma after *ἀληθές*, with Waitz.

nothing is proved. If the hypothesis is that *A* belongs not to all but to some *B*, it is not proved that *A* belongs 40 not to all *B*, but that it belongs to no *B*. For if *A* belongs to some *B*, and *C* to all *A*, then *C* will belong to some *B*. If then this is impossible, it is false that *A* belongs to some *B*; consequently it is true that *A* belongs to no *B*. But if this 62^a is proved, the truth is refuted as well; for the original conclusion was that *A* belongs to some *B*, and does not belong to some *B*. Further the impossible does not result from the hypothesis: for then the hypothesis would be false, 5 since it is impossible to draw a false conclusion from true premisses: but in fact it is true: for *A* belongs to some *B*. Consequently we must not suppose that *A* belongs to some *B*, but that it belongs to all *B*. Similarly if we should be proving that *A* does not belong to some *B*: for if 'not to belong to some' and 'to belong not to all' have the same meaning, the demonstration of both will be identical. 10

It is clear then that not the contrary but the contradictory ought to be supposed in all the syllogisms. For thus we shall have necessity of inference, and the claim we make is one that will be generally accepted. For if of everything one or other of two contradictory statements holds good, then if it is proved that the negation does not hold, the affirmation must be true. Again if it is not admitted that the affirma- 15 tion is true, the claim that the negation is true will be generally accepted. But in neither way does it suit to maintain the *contrary*: for it is not necessary that if the universal negative is false, the universal affirmative should be true, nor is it generally accepted that if the one is false the other is true.

- 12 It is clear then that in the first figure all problems except 20 the universal affirmative are proved *per impossibile*. But in the middle and the last figures this also is proved. Suppose that *A* does not belong to all *B*, and let it have been assumed that *A* belongs to all *C*. If then *A* belongs not to all *B*, but 25 to all *C*, *C* will not belong to all *B*. But this is impossible (for suppose it to be clear that *C* belongs to all *B*): consequently the hypothesis is false. It is true then that *A* belongs

to all *B*. But if the contrary is supposed, we shall have a syllogism and a result which is impossible: but the problem
 30 in hand is not proved. For if *A* belongs to no *B*, and to all *C*, *C* will belong to no *B*. This is impossible; so that it is false that *A* belongs to no *B*. But though this is false, it does not follow that it is true that *A* belongs to all *B*.

When *A* belongs to some *B*, suppose that *A* belongs to no *B*, and let *A* belong to all *C*. It is necessary then that *C*
 35 should belong to no *B*. Consequently, if this is impossible, *A* must belong to some *B*. But if it is supposed that *A* does not belong to some *B*, we shall have the same results¹ as in the first figure.²

Again suppose that *A* belongs to some *B*, and let *A* belong to no *C*. It is necessary then that *C* should not belong to some *B*. But originally it belonged to all *B*,
 40 consequently the hypothesis is false: *A* then will belong to no *B*.

When *A* does not belong to all *B*, suppose it does belong
 62^b to all *B*, and to no *C*. It is necessary then that *C* should belong to no *B*. But this is impossible: so that it is true that *A* does not belong to all *B*. It is clear then that all the syllogisms can be formed in the middle figure.

5 Similarly they can all be formed in the last figure.¹ Suppose that *A* does not belong to some *B*, but *C* belongs to all *B*: then *A* does not belong to some *C*. If then this is impossible, it is false that *A* does not belong to some *B*; so that it is true that *A* belongs to all *B*. But if it is supposed that *A* belongs to no *B*, we shall have a syllogism and a conclusion which is impossible: but the problem in hand is not
 10 proved: for if the contrary is supposed, we shall have the same results as before.²

But to prove that *A* belongs to some *B*, this hypothesis must be made. If *A* belongs to no *B*, and *C* to some *B*, *A* will belong not to all *C*. If then this is false, it is true that *A* belongs to some *B*.

15 When *A* belongs to no *B*, suppose *A* belongs to some *B*, and let it have been assumed that *C* belongs to all *B*. Then

¹ Read τὰν' ἔσται in l. 36.

² 61^b 39-62^a 8.

³ 28-32. Read τὰν' ἔσται in l. 10 with cod. n.

it is necessary that *A* should belong to some *C*. But *ex hypothesi* it belongs to no *C*, so that it is false that *A* belongs to some *B*. But if it is supposed that *A* belongs to all *B*, the problem is not proved.

But this hypothesis must be made if we are to prove that *A* belongs not to all *B*. For if *A* belongs to all *B* ²⁰ and *C* to some *B*, then *A* belongs to some *C*. But this we assumed not to be so, so it is false that *A* belongs to all *B*. But in that case it is true that *A* belongs not to all *B*. If however it is assumed that *A* belongs to some *B*, we shall have the same result as before.¹

It is clear then that in all the syllogisms which proceed ²⁵ *per impossibile* the contradictory must be assumed. And it is plain that in the middle figure an affirmative conclusion, and in the last figure a universal conclusion, are proved in a way.

- 14 Demonstration *per impossibile* differs from ostensive proof in that it posits what it wishes to refute by reduction ² to ³⁰ a statement admitted to be false; whereas ostensive proof starts from admitted positions.³ Both, indeed, take two premisses that are admitted, but the latter takes the premisses from which the syllogism starts, the former takes one of these, along with the contradictory of the original conclusion. Also in the ostensive proof it is not necessary ³⁵ that the conclusion should be known, nor that one should suppose beforehand that it is true or not: in the other it is necessary to suppose beforehand that it is not true. It makes no difference whether the conclusion is affirmative or negative; the method is the same in both cases. Everything which is concluded ostensively can be proved *per impossibile*, and that which is proved *per impossibile* can be proved ⁴⁰ ostensively, through the same terms.⁴ Whenever the syllogism ⁵ is formed in the first figure, the truth ⁶ will be found ^{63^a} in the middle or the last figure, if negative in the middle,

¹ 61^b 39-62^a 8. Read ταὐτ' ἔσται in l. 23 with cod. n.

² Omit the comma after ἀναστρέφειν in l. 30.

³ Omit ἀληθῶν in l. 32 with B, C, and Waitz.

⁴ Omit οὐκ . . . σχήμασιν in l. 41 with the MSS. and Waitz.

⁵ i.e. the reduction *ad impossibile*.

⁶ i.e. the ostensive syllogism.

if affirmative in the last. Whenever the syllogism is formed in the middle figure, the truth will be found in the first, whatever the problem may be. Whenever the syllogism is
 5 formed in the last figure, the truth will be found in the first and middle figures, if affirmative in the first, if negative in the middle. Suppose that *A* has been proved to belong to no *B*, or not to all *B*, through the first figure. Then the hypothesis must have been that *A* belongs to some *B*, and
 10 the original premisses that *C* belongs to all *A* and to no *B*. For thus the syllogism was made and the impossible conclusion reached. But this is the middle figure, if *C* belongs to all *A* and to no *B*. And it is clear from these premisses that *A* belongs to no *B*. Similarly if *A* has been proved
 15 not to belong to all *B*. For the hypothesis is that *A* belongs to all *B*; and the original premisses are that *C* belongs to all *A* but not to all *B*. Similarly too, if the premiss *CA* should be negative: for thus also we have the middle figure. Again suppose it has been proved that *A* belongs to some *B*. The hypothesis here is that *A*
 20 belongs to no *B*; and the original premisses that *B* belongs to all *C*, and *A* either to all or to some *C*: for in this way we shall get what is impossible. But if *A* and *B* belong to all *C*, we have the last figure. And it is clear from these premisses that *A* must belong to some *B*. Similarly if *B* or *A* should be assumed to belong to some *C*.
 25 Again suppose it has been proved in the middle figure that *A* belongs to all *B*. Then the hypothesis must have been that *A* belongs not to all *B*, and the original premisses that *A* belongs to all *C*, and *C* to all *B*: for thus we shall get what is impossible. But if *A* belongs to all *C*, and *C* to all *B*, we have the first figure. Similarly if it has been
 30 proved that *A* belongs to some *B*: for the hypothesis then must have been that *A* belongs to no *B*, and the original premisses that *A* belongs to all *C*, and *C* to some *B*. If the syllogism is negative, the hypothesis must have been that *A* belongs to some *B*, and the original premisses that *A* belongs to no *C*, and *C* to all *B*, so that the first figure results. If the
 35 syllogism is not universal, but proof has been given that *A* does not belong to some *B*, we may infer in the same way.

The hypothesis is that *A* belongs to all *B*, the original premisses that *A* belongs to no *C*, and *C* belongs to some *B*: for thus we get the first figure.

Again suppose it has been proved in the third figure that ⁴⁰ *A* belongs to all *B*. Then the hypothesis must have been that *A* belongs not to all *B*, and the original premisses that ^{63^b} *C* belongs to all *B*, and *A* belongs to all *C*: for thus we shall get what is impossible. And the original premisses form the first figure. Similarly if the demonstration establishes a particular proposition: the hypothesis then must have been that *A* belongs to no *B*, and the original premisses that *C* belongs to some *B*, and *A* to all *C*. If the syllogism ⁵ is negative, the hypothesis must have been that *A* belongs to some *B*, and the original premisses that *C* belongs to no *A* and to all *B*, and this is the middle figure. Similarly if the demonstration is not universal. The hypothesis will then be that *A* belongs to all *B*, the premisses that *C* belongs ¹⁰ to no *A* and to some *B*: and this is the middle figure.

It is clear then that it is possible through the same terms to prove each of the problems ostensively as well.¹ Similarly it will be possible if the syllogisms are ostensive to reduce them *ad impossibile* in the terms which have been taken, ¹⁵ whenever the contradictory of the conclusion of the ostensive syllogism is taken as a premiss. For the syllogisms become identical with those which are obtained by means of conversion, so that we obtain immediately the figures through which each problem will be solved. It is clear then that every thesis can be proved in both ways, i. e. *per impossibile* and ostensively, and it is not possible to separate one method ²⁰ from the other.

- ¹⁵ In what figure it is possible to draw a conclusion from premisses which are opposed, and in what figure this is not possible, will be made clear in this way. Verbally four kinds of opposition are possible, viz. universal affirmative to universal negative, universal affirmative to particular negative, ²⁵ particular affirmative to universal negative, and particular affirmative to particular negative: but really there are only

¹ Omit καὶ . . . ἀδυνάτου in l. 13 with A, C, and Waitz.

three : for the particular affirmative is only verbally opposed to the particular negative. Of the genuine opposites I call those which are universal *contraries*, the universal affirmative and the universal negative, e. g. 'every science is good',
 30 'no science is good'; the others I call *contradictories*.¹

In the first figure no syllogism whether affirmative or negative can be made out of opposed premisses : no affirmative syllogism is possible because both premisses must be affirmative, but opposites are, the one affirmative, the other
 35 negative : no negative syllogism is possible because opposites affirm and deny the same predicate of the same subject, and the middle term in the first figure is not predicated of both extremes, but one thing is denied of it, and it is affirmed of something else : but such premisses are not opposed.

40 In the middle figure a syllogism can be made both of contradictories and of contraries. Let *A* stand for good, let
 64^a *B* and *C* stand for science. If then one assumes that every science is good, and no science is good, *A* belongs to all *B* and to no *C*, so that *B* belongs to no *C* : no science then is a science. Similarly if after taking 'every science is good'
 5 one took 'the science of medicine is not good'; for *A* belongs to all *B* but to no *C*, so that a particular science will not be a science. Again, a particular science will not be a science if *A* belongs to all *C* but to no *B*, and *B* is science, *C* medicine, and *A* supposition : for after taking
 10 'no science is supposition', one has assumed that a particular science is supposition. This syllogism differs from the preceding because the relations between the terms are reversed : before, the affirmative statement concerned *B*, now it concerns *C*. Similarly if one premiss is not universal : for the middle term is always that which is stated negatively of one extreme, and affirmatively of the other.
 15 Consequently it is possible that contradictories may lead to a conclusion, though not always or in every mood, but only if the terms subordinate to the middle are such that they are either identical or related as whole to part. Otherwise

¹ Elsewhere Aristotle sometimes expresses this by ἀντιφατικῶς ἀντικείσθαι.

animal, because the syllogism springs out of a contradiction and the terms presupposed are either identical or related as whole and part. It is evident also that in fallacious reasonings nothing prevents a contradiction to the hypothesis from resulting, e. g. if something is odd, it is not odd.

15 For the syllogism owed its contrariety to its contradictory premisses; if we assume such premisses we shall get a result that contradicts our hypothesis. But we must recognize that contraries cannot be inferred from a single syllogism in such a way that we conclude that what is not good is good, or anything of that sort,¹ unless a self-contradictory

20 premiss is at once assumed, e. g. 'every animal is white and not white', and we proceed 'man is an animal'. Either we must introduce the contradiction by an additional assumption, assuming, e. g., that every science is supposition,² and then assuming 'Medicine is a science, but none of it is supposition' (which is the mode in which refutations are

25 made), or we must argue from two syllogisms. In no other way than this, as was said before,³ is it possible that the premisses should be really contrary.

To beg and assume the original question is a species of failure to demonstrate the problem proposed; but this

30 happens in many ways. A man may not reason syllogistically at all, or he may argue from premisses which are less known or equally unknown, or he may establish the antecedent by means of its consequents; for demonstration proceeds from what is more certain and is prior. Now begging the question is none of these: but since we get to know some things naturally through themselves, and other things

35 by means of something else (the first principles through themselves, what is subordinate to them through something else), whenever a man tries to prove what is not⁴ self-evident by means of itself, then he begs the original question. This may be done by assuming what is in

¹ i. e. in such a way that our conclusion is formally affirmative.

² Omit *καὶ οὐχ ὑπόληψις* in l. 23 with B, n, and Waitz.

³ It has been shown that contrary premisses will not yield an affirmative self-contradictory conclusion in the first figure (63^b 33) or in the third (64^a 20). In the second of course all conclusions are negative.

⁴ Read *μὴ τὸ* in l. 36 with A, B, C, and Waitz.

question at once ; it is also possible to make a transition to other things which would naturally be proved through the 40 thesis proposed, and demonstrate it through them, e.g. if *A* 65^a should be proved through *B*, and *B* through *C*, though it was natural that *C* should be proved through *A* : for it turns out that those who reason thus are proving *A* by means of itself. This is what those persons do who suppose that they are constructing parallel straight lines: for they 5 fail to see that they are assuming facts which it is impossible to demonstrate unless the parallels exist. So it turns out that those who reason thus merely say a particular thing is, if it is: in this way everything will be self-evident. But that is impossible.

If then it is uncertain whether *A* belongs to *C*, and also 10 whether *A* belongs to *B*, and if one should assume that *A* does belong to *B*, it is not yet clear whether he begs the original question, but it is evident that he is not demonstrating: for what is as uncertain as the question to be answered cannot be a principle of a demonstration. If however *B* is so related to *C* that they are identical, or if they are 15 plainly convertible, or the one belongs to the other,¹ the original question is begged. For one might equally well prove that *A* belongs to *B* through those terms if they are convertible. But if they are not convertible, it is the fact that they are not that prevents such a demonstration, not the method of demonstrating. But if one were to make the conversion, then he would be doing what we have described² and effecting a reciprocal proof with three propositions.³

Similarly if he should assume that *B* belongs to *C*, this being as uncertain as the question whether *A* belongs to *C*, 20 the question is not yet begged, but no demonstration is made. If however *A* and *B* are identical either because they are convertible or because *A* follows *B*, then the question is begged for the same reason as before. For we have explained the meaning of begging the question, viz. proving that which is not self-evident by means of itself. 25

If then begging the question is proving what is not self-

¹ As genus to species.

² In ll. 1-4.

³ Omit *et* in l. 19 with A, B, C, and Waitz.

evident by means of itself, in other words failing to prove when the failure is due to the thesis to be proved and the premiss through which it is proved being equally uncertain, either because predicates which are identical belong to the same subject, or because the same predicate belongs to subjects which are identical, the question may
 30 be begged in the middle and third figures in both ways,¹ though, if the syllogism is affirmative, only in the third and first figures. If the syllogism is negative, the question is begged when identical predicates are denied of the same subject;² and both premisses do not beg the question indifferently (in a similar way the question may be begged in the middle figure³), because the terms in negative syllo-
 35 gisms are not convertible.⁴ In scientific demonstrations the question is begged when the terms are really related in the manner described, in dialectical arguments when they are according to common opinion so related.

The objection that 'this is not the reason why the result is false', which we frequently make in argument, is made
 40 primarily in the case of a *reductio ad impossibile*, to rebut the proposition which was being proved by the reduction.
 65^b For unless a man has contradicted this proposition he will not say, 'False cause', but urge that something false has been assumed in the earlier parts of the argument; nor will he use the formula in the case of an ostensive proof; for here what one denies⁵ is not assumed as a premiss.

¹ τὰντὰ τῷ αὐτῷ and ταὐτὸν τοῖς αὐτοῖς are explained by ll. 14-23; they refer to *petitio principii* in the minor and major premiss respectively. Now from the forms and rules of the figures it follows that the former can arise only in fig. I (affirmatively) and fig. II (negatively), the latter in figs. I and III (affirmatively and negatively). Thus the statement that both can occur in figs. II and III is not, in its natural meaning, true.

² τὰ αὐτὰ ἀπὸ τοῦ αὐτοῦ is apparently meant to cover the case of ταὐτὸν ἀπὸ τῶν αὐτῶν, the stress being on ἀπὸ. Strictly τὰ αὐτὰ ἀπὸ τοῦ αὐτοῦ is found only in the second figure.

³ ὁσαύτως . . . μέσφ in l. 34 is parenthetical.

⁴ i.e. terms negatively related are not convertible, therefore it must be the terms in the affirmative premiss that are convertible, and the *petitio principii* must be in the negative premiss.

It will be noticed that both in accuracy and in form this paragraph falls below the general level of the *Prior Analytics*. It bears clear marks of haste.

⁵ Read τίθησι δ ἀντίφασιν in l. 3 with A₂, B, C, and Waitz.

Further when anything is refuted ostensibly by the terms *ABC*, it cannot be objected that the syllogism does not 5 depend on the assumption laid down. For we use the expression 'false cause', when the syllogism is concluded in spite of the refutation of this position; but that is not possible in ostensive proofs: since if an assumption is refuted, a syllogism can no longer be drawn in reference to it. It is clear then that the expression 'false cause' can only be used in the case of a *reductio ad impossibile*, and 10 when the original hypothesis is so related to the impossible conclusion, that the conclusion results indifferently whether the hypothesis is made or not. The most obvious case of the irrelevance of an assumption to a conclusion which is false is when a syllogism drawn from middle terms to an impossible conclusion is independent of the hypothesis, as 15 we have explained in the *Topics*.¹ For to put that which is not the cause as the cause, is just this: e.g. if a man, wishing to prove that the diagonal of the square is incommensurate with the side, should try to prove Zeno's theorem that motion is impossible, and so establish a *reductio ad impossibile*: for Zeno's false theorem has no connexion at 20 all with the original assumption. Another case is where the impossible conclusion is connected with the hypothesis, but does not result from it. This may happen whether one traces the connexion upwards or downwards, e.g. if it is laid down that *A* belongs to *B*, *B* to *C*, and *C* to *D*, and it should 25 be false that *B* belongs to *D*: for if we eliminated *A* and assumed all the same that *B* belongs to *C* and *C* to *D*, the false conclusion would not depend on the original hypothesis. Or again trace the connexion upwards; e.g. suppose that *A* belongs to *B*, *E* to *A*, and *F* to *E*, it being 30 false that *F* belongs to *A*. In this way too the impossible conclusion would result, though the original hypothesis were eliminated. But the impossible conclusion ought to be connected with the original terms: in this way it will depend on the hypothesis, e.g. when one traces the connexion downwards, the impossible conclusion must be connected with that term which is predicate in the hypo- 35

¹ *Soph. El.* 167^b 21-36.

thesis: for if it is impossible that *A* should belong to *D*, the false conclusion will no longer result after *A* has been eliminated. If one traces the connexion upwards, the impossible conclusion must be connected with that term which is subject in the hypothesis: for if it is impossible that *F* should belong to *B*, the impossible conclusion will disappear if *B* is eliminated. Similarly when the syllogisms

40 are negative.

65^a It is clear then that when the impossibility is not related to the original terms, the false conclusion does not result on account of the assumption. Or perhaps even so it may sometimes be independent.¹ For if it were laid down that *A* belongs not to *B* but to *K*, and that *K* belongs to *C* and
5 *C* to *D*, the impossible conclusion² would still stand. Similarly if one takes the terms in an ascending series. Consequently since the impossibility results whether the first assumption is suppressed or not, it would appear to be independent of that assumption. Or perhaps we ought not to understand the statement that the false conclusion results independently of the assumption, in the sense that
10 if something else were supposed the impossibility would result; but rather we mean that when the first assumption is eliminated, the same impossibility results through the remaining premisses; since it is not perhaps absurd that the same false result should follow from several hypotheses, e.g. that parallels meet, both on the assumption that the interior angle is greater than the exterior and on the assumption that a triangle contains more than two right
15 angles.

A false argument depends on the first false statement in it. Every syllogism is made out of two or more premisses. If then the false conclusion is drawn from two premisses, one or both of them must be false: for (as was proved³) a false syllogism cannot be drawn from true premisses.
20 But if the premisses are more than two, e.g. if *C* is established through *A* and *B*, and these through *D*, *E*, *F*, and *G*,

¹ Mark of interrogation after $\psi\epsilon\upsilon\delta\omicron\varsigma$ in l. 3 (Waitz).

² i.e. that *A* belongs to *D*. ³ 53^b 11-25.

one of these higher propositions must be false, and on this the argument depends: for *A* and *B* are inferred by means of *D*, *E*, *F*, and *G*. Therefore the conclusion and the error results from one of them.

- 19 In order to avoid having a syllogism drawn against us, 25 we must take care, whenever an opponent asks us to admit the reason without the conclusions, not to grant him the same term twice over in his premisses, since we know that a syllogism cannot be drawn without a middle term, and that term which is stated more than once is the middle. How we ought to watch the middle in reference to each conclusion, is evident from our knowing what kind of thesis 30 is proved in each figure. This will not escape us since we know how we are maintaining the argument.

That which we urge men to beware of in their admissions, they ought in attack to try to conceal. This will be possible first, if, instead of drawing the conclusions of pre- 35 liminary syllogisms, they take the necessary premisses and leave the conclusions in the dark; secondly if instead of inviting assent to propositions which are closely connected they take as far as possible those that are not connected by middle terms.¹ For example suppose that *A* is to be inferred to be true of *F*; *B*, *C*, *D*, and *E* being middle terms. One ought then to ask whether *A* belongs to *B*, and next whether *D* belongs to *E*, instead of asking whether *B* belongs to *C*; after that he may ask whether *B* 40 belongs to *C*, and so on. If the syllogism is drawn through 66^b one middle term, he ought to begin with that: in this way he will most likely deceive his opponent.

- 20 Since we know when a syllogism can be formed and how its terms must be related, it is clear when refutation will 5 be possible and when impossible. A refutation is possible whether everything is conceded, or the answers alternate (one, I mean, being affirmative, the other negative). For as has been shown a syllogism is possible whether the terms are related in affirmative propositions or one proposition is

¹ Read *μάλιστα ἄμεσα* in I. 37 with A, B, C₂, and Waitz, and perhaps Phil.

affirmative, the other negative: consequently, if what is laid
 10 down is ¹ contrary to the conclusion, a refutation must take
 place: for a refutation is a syllogism which establishes the
 contradictory. But if nothing is conceded, a refutation is
 impossible: for no syllogism is possible (as we saw ²) when
 all the terms are negative: therefore no refutation is pos-
 15 sible. For if a refutation were possible, a syllogism must
 be possible; although if a syllogism is possible it does not
 follow that a refutation is possible. Similarly refutation is
 not possible if nothing is conceded universally: since the
 fields of refutation and syllogism are defined in the same
 way.

It sometimes happens that just as we are deceived in the ²¹
 arrangement of the terms,³ so error may arise in our thought
 20 about them, e. g. if it is possible that the same predicate
 should belong to more than one subject immediately,⁴ but
 although knowing the one, a man may forget the other and
 think the opposite true. Suppose that *A* belongs to *B* and
 to *C* in virtue of their nature, and that *B* and *C* belong to
 all *D* in the same way. If then a man thinks that *A*
 belongs to all *B*, and *B* to *D*, but *A* to no *C*, and *C* to all
 25 *D*, he will both know and not know the same thing⁵ in
 respect of the same thing.⁶ Again if a man were to make a
 mistake about the members of a single series; e. g. suppose
A belongs to *B*, *B* to *C*, and *C* to *D*, but some one thinks
 that *A* belongs to all *B*, but to no *C*: he will both know
 30 that *A* belongs to *D*, and think that it does not. Does he
 then maintain after this simply that what he knows, he
 does not think? For he knows in a way that *A* belongs
 to *C* through *B*, since the part is included in the whole; so
 that what he knows in a way, this he maintains he does not
 think at all: but that is impossible.

35 In the former case, where the middle term does not
 belong to the same series, it is not possible to think both
 the premisses with reference to each of the two middle
 terms: e. g. that *A* belongs to all *B*, but to no *C*, and both

¹ Read εἰς in l. 10 with cod. m, n₂, and Waitz.

² 41^b 6.

³ Cf. i. 32 ff.

⁴ Read πρῶτος in l. 20 with A, B, C, and Waitz.

⁵ i. e. subject.

⁶ i. e. attribute.

B and *C* belong to all *D*. For it turns out that the first premiss of the one syllogism is either wholly or partially contrary to the first premiss of the other. For if he thinks that *A* belongs to everything to which *B* belongs, and he knows that *B* belongs to *D*, then he knows that *A* belongs to *D*. Consequently if again he thinks that *A* belongs to nothing to which *C* belongs, he thinks that *A* does not belong to some of that to which *B* belongs;¹ but if he thinks that *A* belongs to everything to which *B* belongs, and again thinks that *A* does not belong to some of that to which *B* belongs, these beliefs are wholly or partially contrary. In this way then it is not possible to think; but nothing prevents a man thinking one premiss of each syllogism or both premisses of one of the two syllogisms: e.g. *A* belongs to all *B*, and *B* to *D*, and again *A* belongs to no *C*. An error of this kind is similar to the error into which we fall concerning particulars: e.g. if *A* belongs to all *B*, and *B* to all *C*, *A* will belong to all *C*. If then a man knows that *A* belongs to everything to which *B* belongs, he knows that *A* belongs to *C*. But nothing prevents his being ignorant that *C* exists; e.g. let *A* stand for two right angles, *B* for triangle, *C* for a particular diagram of a triangle. A man might think that *C* did not exist, though he knew that every triangle contains two right angles; consequently he will know and not know the same thing at the same time. For the expression 'to know that every triangle has its angles equal to two right angles' is ambiguous, meaning to have the knowledge either of the universal or of the particulars. Thus then he knows that *C* contains two right angles with a knowledge of the universal, but not with a knowledge of the particulars; consequently his knowledge will not be contrary to his ignorance. The argument in the *Meno*² that learning is recollection may be criticized in a similar way. For it never happens that a man starts with a foreknowledge of the particular, but along with the process of being led to see the general

¹ ὅτι τὸ β ὑπάρχει, τὰ δὲ τούτῳ would be more correct, but perhaps the text may stand.

² 81.

principle he receives a knowledge of the particulars, by an act (as it were) of recognition. For we know some things directly; e g that the angles are equal to two right angles, 25 if we know that the figure is a triangle. Similarly in all other cases.

By a knowledge of the universal then we see the particulars, but we do not know them by the kind of knowledge which is proper to them, consequently it is possible that we may make mistakes about them, but not that we should have the knowledge and error that are contrary to one another. rather we have the knowledge of the universal 30 but make a mistake in apprehending the particular. Similarly in the cases stated above.¹ The error in respect of the middle term is not contrary to the knowledge obtained through the syllogism, nor is the thought in respect of one middle term contrary to that in respect of the other. Nothing prevents a man who knows both that *A* belongs to the whole of *B*, and that *B* again belongs to *C*, thinking 35 that *A* does not belong to *C*, e g knowing that every mule is sterile and that this is a mule, and thinking that this animal is with foal: for he does not know that *A* belongs to *C*, unless he considers the two propositions together. So it is evident that if he knows the one and does not know the other, he will fall into error. And this is the relation of knowledge of the universal to knowledge of the 67^b particular. For we know no sensible thing, once it has passed beyond the range of our senses, even if we happen to have perceived it, except by means of the universal *and* the possession of the knowledge which is proper to the particular, but without the actual exercise of that knowledge. For to know is used in three senses: it may mean either to have knowledge of the universal or to have 5 knowledge proper to the matter in hand or to exercise such knowledge: consequently three kinds of error also are possible. Nothing then prevents a man both knowing and being mistaken about the same thing, provided that his knowledge and his error are not contrary. And this happens also to the man whose knowledge is limited to each

¹ 66^b 20-6, 26-30.

of the premisses and who has not previously considered the particular question. For when he thinks that the mule is with foal he has not the knowledge in the sense of its actual exercise, nor on the other hand has his thought 10 caused an error contrary to his knowledge: for the error contrary to the knowledge of the universal would be a syllogism.

But he who thinks the essence of good is the essence of bad will think the same thing to be the essence of good and the essence of bad. Let *A* stand for the essence of good and *B* for the essence of bad, and again *C* for the essence of good. Since then he thinks *B* and *C* identical, he will 15 think that *C* is *B*, and similarly that *B* is *A*, consequently that *C* is *A*. For just as we saw that if *B* is *true* of all of which *C* is *true*, and *A* is true of all of which *B* is true, *A* is true of *C*, similarly with the word 'think'. Similarly also with the word 'is'; for we saw that if *C* is the same as 20 *B*, and *B* as *A*, *C* is the same as *A*. Similarly therefore with 'opine'. Perhaps then this ¹ is necessary if a man will grant the first point.² But presumably that is false, that any one could suppose the essence of good to be the essence of bad, save incidentally. For it is possible to think this in many 25 different ways. But we must consider this matter better.³

- 22 Whenever the extremes are convertible it is necessary that the middle should be convertible with both. For if *A* belongs to *C* through *B*, then if *A* and *C* are convertible and *C* belongs to everything to which *A* belongs, *B* is convertible with *A*, and *B* belongs to everything to which *A* belongs, 30 through *C* as middle, and *C* is convertible with *B* through *A* as middle.⁴ Similarly if the conclusion is negative, e.g. if *B* belongs to *C*, but *A* does not belong to *B*, neither will *A* belong to *C*. If then *B* is convertible with *A*, *C* will

¹ That a man should think the same thing to be the essence of good and to be the essence of bad.

² That the essence of good is the essence of bad.

³ The reference may be to *Met.* I. 4.

⁴ All *B* is *A*

∴ All *C* is *B*

∴ All *C* is *A*

All *C* is *B*

All *A* is *C*

∴ All *A* is *B*

All *A* is *C*

All *B* is *A*

∴ All *B* is *C*

whole of *B* and to *C* and is affirmed of nothing else, and *B* also belongs to all *C*, it is necessary that *A* and *B* should be convertible: for since *A* is said of *B* and *C* only, and *B* is affirmed both of itself and of *C*, it is clear that *B* will be ²⁰ said of everything of which *A* is said, except *A* itself. Again when *A* and *B* belong to the whole of *C*, and *C* is convertible with *B*, it is necessary that *A* should belong to all *B*: for since *A* belongs to all *C*, and *C* to *B* by conversion, *A* will belong to all *B*.

When, of two opposites *A* and *B*, *A* is preferable to *B*, ²⁵ and similarly *D* is preferable to *C*, then if *A* and *C* together are preferable to *B* and *D* together, *A* must be preferable to *D*. For *A* is an object of desire to the same extent as *B* is an object of aversion, since they are opposites: and *C* is similarly related to *D*, since they also are opposites. If then *A* is an object of desire to the same extent as *D*, *B* is an ³⁰ object of aversion to the same extent as *C* (since each is to the same extent as each—the one an object of aversion, the other an object of desire). Therefore both *A* and *C* together, and *B* and *D* together, will be equally objects of desire or aversion. But since *A* and *C* are preferable to *B* and *D* *A* cannot be equally desirable with *D*; for then *B* along with *D* would be equally desirable with *A* along with *C*. But if *D* is preferable to *A*, then *B* must be less an object ³⁵ of aversion than *C*: for the less is opposed to the less. But the greater good and lesser evil are preferable to the lesser good and greater evil: the whole *BD* then is preferable to the whole *AC*. But *ex hypothesi* this is not so. *A* then is preferable to *D*, and *C* consequently is less an object of aversion than *B*. If then every lover in virtue of his love would prefer *A*, viz. that the beloved should be such as ⁴⁰ to grant a favour, and yet should not grant it (for which *C* stands), to the beloved's granting the favour (represented by *D*) without being such as to grant it (represented by *B*), it is ^{68^b} clear that *A* (being of such a nature) is preferable to granting the favour. To receive affection then is preferable in love to sexual intercourse. Love then is more dependent on friendship than on intercourse. And if it is most dependent on receiving affection, then this is its end. Intercourse then ⁵

either is not an end at all or is an end relative to the further end, the receiving of affection. And indeed the same is true of the other desires and arts.

It is clear then how the terms are related in conversion, and in respect of being in a higher degree objects of aversion
 10 or of desire.¹ We must now state that not only dialectical and demonstrative syllogisms are formed by means of the afore-said figures, but also rhetorical syllogisms and in general any form of persuasion, however it may be presented. For every belief comes either through syllogism or from induction.

15 Now induction, or rather the syllogism which springs out of induction, consists in establishing syllogistically a relation between one extreme and the middle by means of the other extreme, e. g. if *B* is the middle term between *A* and *C*, it consists in proving through *C* that *A* belongs to *B*. For this is the manner in which we make inductions. For example let *A* stand for long-lived, *B* for bileless, and *C*
 20 for the particular long-lived animals, e. g. man, horse, mule. *A* then belongs to the whole of *C*: for whatever is bileless is long-lived. But *B* also ('not possessing bile') belongs to all *C*. If then *C* is convertible with *B*, and the middle term is not wider in extension, it is necessary that *A* should belong to *B*. For it has already been proved² that
 25 if two things belong to the same thing, and the extreme³ is convertible with one of them, then the other predicate will belong to the predicate that is converted. But we must apprehend *C* as made up of all the particulars. For induction proceeds through an enumeration of all the cases.

30 Such is the syllogism which establishes the first and

¹ Read *φευκτότεροι ἢ (ἢ καὶ C) αἰρετώτεροι* in L. 9 with A, B, C, and Waitz.

² 21-25.

³ i.e. the subject of both predicates, which, being a particular thing, is of the nature of a minor term, and would be minor term in the first figure, though as subject of both premisses it actually serves as middle term in the supposed syllogism in the third figure. The transition from the syllogism in the third figure which yields only a particular conclusion to that in the first figure, which yields a universal conclusion, may be represented thus:

| | |
|-----------------------------|----------------------------|
| All <i>C</i> is <i>A</i> | All <i>C</i> is <i>A</i> |
| All <i>C</i> is <i>B</i> | All <i>B</i> is <i>C</i> |
| ∴ Some <i>B</i> is <i>A</i> | ∴ All <i>B</i> is <i>A</i> |

immediate premiss: for where there is a middle term the syllogism proceeds through the middle term; when there is no middle term, through induction. And in a way induction is opposed to syllogism: for the latter proves the major term to belong to the third term by means of the middle, the former proves the major to belong to the middle by means of the third. In the order of nature, syllogism³³ through the middle term is prior and better known, but syllogism through induction is clearer to us.

- 24 We have an 'example' when the major term is proved to belong to the middle by means of a term which resembles the third. It ought to be known both that the middle belongs to the third term, and that the first belongs to that which⁴⁰ resembles the third. For example let *A* be evil, *B* making war against neighbours, *C* Athenians against Thebans, *D* 69^a Thebans against Phocians. If then we wish to prove that to fight with the Thebans is an evil, we must assume that to fight against neighbours is an evil. Evidence of this is obtained from similar cases, e.g. that the war against the Phocians was an evil to the Thebans. Since then to⁵ fight against neighbours is an evil, and to fight against the Thebans is to fight against neighbours, it is clear that to fight against the Thebans is an evil. Now it is clear that *B* belongs to *C* and to *D* (for both are cases of making war upon one's neighbours) and that *A* belongs to *D* (for the war against the Phocians did not turn out well for the¹⁰ Thebans): but that *A* belongs to *B* will be proved through *D*. Similarly if the belief in the relation of the middle term to the extreme should be produced by several similar cases. Clearly then to argue by example is neither like reasoning from part to whole, nor like reasoning from whole to part, but rather reasoning from part to part, when both particulars¹⁵ are subordinate to the same term, and one of them is known. It differs from induction, because induction starting from all the particular cases proves (as we saw¹) that the major term belongs to the middle, and does not apply the syllogistic conclusion to the minor term, whereas argument by example

¹ ch. 23.

does make this application and does not draw its proof from all the particular cases.

- 20 By reduction we mean an argument in which the first term 21 clearly belongs to the middle, but the relation of the middle to the last term is uncertain though equally or more probable than the conclusion; or again an argument in which the terms intermediate between the last term and the middle are few. For in any of these cases it turns out that we approach more nearly to knowledge. For example let *A* stand for 25 what can be taught, *B* for knowledge, *C* for justice. Now it is clear that knowledge can be taught: but it is uncertain whether virtue is knowledge. If now the statement *BC*¹ is equally or more probable than *AC*, we have a reduction: for we are nearer to knowledge, since we have taken a new term,² being so far without knowledge that *A* belongs to *C*. Or again suppose that the terms intermediate between *B* and 30 *C* are few: for thus too we are nearer knowledge. For example let *D* stand for squaring, *E* for rectilinear figure, *F* for circle. If there were only one term intermediate between *E* and *F* (viz. that the circle is made equal to a rectilinear figure by the help of lunules), we should be near to knowledge. But when *BC* is not more probable than *AC*, 35 and the intermediate terms are not few, I do not call this reduction: nor again when the statement *BC* is immediate: for such a statement is knowledge.

An objection is a premiss contrary to a premiss. It differs 21 from a premiss, because it may be particular, but a premiss either cannot be particular at all or not in universal syllogisms.

- 69^b An objection is brought in two ways and through two figures; in two ways because every objection is either universal or particular, by two figures because objections are brought in opposition to the premiss, and opposites can be 5 proved only in the first and third figures. If a man maintains a universal affirmative, we reply with a universal or a particular negative; the former is proved from the first

¹ See note 26^a 29.

² viz. *B*, thus obtaining a certain premiss *AB*, and a premiss *BC*, on which the inquiry now turns.

figure, the latter from the third. For example let *A* stand for there being a single science, *B* for contraries. If a man premises that contraries are subjects of a single science, the objection may be either that opposites are never subjects of a single science, and contraries are opposites, so that we get the first figure, or that the knowable and the unknowable are not subjects of a single science: this proof is in the third figure: for it is true of *C* (the knowable and the unknowable) that they are contraries, and it is false that they are the subjects of a single science.

Similarly if the premiss objected to is negative. For if a man maintains that contraries are not subjects of a single science, we reply either that all opposites or that certain contraries, e.g. what is healthy and what is sickly, are subjects of the same science: the former argument issues from the first, the latter from the third figure.

In general if a man urges a universal objection he must frame his contradiction with reference to the universal of the terms taken by his opponent, e.g. if a man maintains that *contraries* are not subjects of the same science, his opponent must reply that there is a single science of all *opposites*.¹ Thus we must have the first figure: for the term which embraces the original subject becomes the middle term.

If the objection is particular, the objector must frame his contradiction with reference to a term relatively to which the subject of his opponent's premiss is universal, e.g. he will point out that the knowable and the unknowable are not subjects of the same science: 'contraries' is universal relatively to these. And we have the third figure: for the particular term assumed is middle, e.g. the knowable and the unknowable. Premises from which it is possible to draw the contrary conclusion are what we start from when we try to make objections. Consequently we bring objections in these figures only: for in them only are opposite syllogisms possible, since the second figure cannot produce an affirmative conclusion.

¹ Read a comma before, not after, *παρρη*, l. 22.

Besides, an objection in the middle figure would require a fuller argument, e.g. if it should not be granted that *A* belongs to *B*, because *C* does not follow *B*.¹ This can
 35 be made clear only by other premisses. But an objection ought not to turn off into other things, but have its new premiss quite clear immediately. For this reason also this is the only figure from which proof by signs cannot be obtained.²

We must consider later the other kinds of objection, namely the objection from contraries, from similars, and from com-
 70^a mon opinion, and inquire whether a particular objection cannot be elicited from the first figure or a negative objection from the second.³

A probability and a sign are not identical, but a probability is a generally approved proposition: what men know to
 5 happen or not to happen, to be or not to be, for the most part thus and thus, is a probability, e.g. 'the envious hate', 'the beloved show affection'. A sign means a demonstrative proposition necessary or generally approved: for anything such that when it is another thing is, or when it has come into being the other has come into being before or after, is a sign of the other's being or having come into being. Now
 10 an enthymeme is a syllogism starting from probabilities or signs, and a sign may be taken in three ways, corresponding to the position of the middle term in the figures. For it may be taken as in the first figure or the second or the third. For example the proof that a woman is with child because she has milk is in the first figure: for to have
 15 milk is the middle term. Let *A* represent to be with child, *B* to have milk, *C* woman. The proof that wise men are

¹ i.e. if the objection takes the form

All *A* is *C*.
 No *B* is *C*.
 ∴ No *B* is *A*.

² It may be conjectured that this sentence is a gloss (so Susemihl), or that it should come after *καταφατικῶς* in l. 32. The fact that the second figure is necessarily negative is in effect the reason given in 70^a 35-7 for the invalidity of proof by signs in that figure.

³ This sentence is inconsistent with what precedes, and is perhaps, as Cook Wilson has pointed out, a gloss added by some one who was familiar with the treatment of *ἐνταυτίς* in *Rhet.* ii. 25.

good, since Pittacus is good, comes through the last figure. Let *A* stand for good, *B* for wise men, *C* for Pittacus. It is true then to affirm both *A* and *B* of *C*: only men do not say the latter, because they know it, though they state the former. The proof that a woman is with child because she is pale is meant to come through the middle figure: for since paleness follows women with child and is a concomitant of this woman, people suppose it has been proved that she is with child. Let *A* stand for paleness, *B* for being with child, *C* for woman. Now if the one proposition is stated, we have only a sign, but if the other is stated as well, a syllogism, e.g. 'Pittacus is generous, since ambitious men are generous and Pittacus is ambitious.' Or again 'Wise men are good, since Pittacus is not only good but wise.' In this way then syllogisms are formed, only that which proceeds through the first figure is irrefutable if it is true (for it is universal), that which proceeds through the last figure is refutable even if the conclusion is true, since the syllogism is not universal nor correlative to the matter in question: for though Pittacus is good, it is not therefore necessary that all other wise men should be good. But the syllogism which proceeds through the middle figure is always refutable in any case: for a syllogism can never be formed when the terms are related in this way: for though a woman with child is pale, and this woman also is pale, it is not necessary that she should be with child. Truth then may be found in signs whatever their kind, but they have the differences we have stated.

We must either divide signs in the way stated, and among them designate the middle term as the index¹ (for people call that the index which makes us know, and the middle term above all has this character), or else we must call the arguments derived from the extremes signs, that derived from the middle term the index: for that which is proved through the first figure is most generally accepted and most true.

It is possible to infer character from features, if it is

¹ This points to the argument in the first figure, whose middle term is a genuine middle term.

granted that the body and the soul are changed together by the natural affections: I say 'natural', for though perhaps by learning music a man has made some change in his soul, 10 this is not one of those affections which are natural to us; rather I refer to passions and desires when I speak of natural motions. If then this were granted and also that for each change there is a corresponding sign, and we could state the affection and sign proper to each kind of animal, we shall be able to infer character from features. For if there is an affection which belongs properly to an 15 individual kind, e.g. courage to lions, it is necessary that there should be a sign of it: for *ex hypothesi* body and soul are affected together. Suppose this sign is the possession of large extremities: this may belong to other kinds also though not universally. For the sign is proper in the sense stated, because the affection is proper to the whole kind, though not proper to it alone, according to our usual 20 manner of speaking. The same thing then will be found in another kind, and man may be brave, and some other kinds of animal as well. They will then have the sign: for *ex hypothesi* there is one sign corresponding to each affection. If then this is so, and we can collect signs of this sort in these animals which have only one affection proper to them—but each affection has its sign, since it is necessary that it 25 should have a single sign—we shall then be able to infer character from features. But if the kind as a whole has two properties, e.g. if the lion is both brave and generous, how shall we know which of the signs which are its proper concomitants is the sign of a particular affection? Perhaps if both belong to some other kind though not to the whole of it, and if, in those kinds in which each is found though not in the whole of their members, some members possess one of the affections and not the other: e.g. if a man 30 is brave but not generous, but possesses, of the two signs, large extremities, it is clear that this is the sign of courage in the lion also. To judge character from features, then, is possible in the first figure if¹ the middle term is convertible with the first extreme, but is wider than the third term and

¹ Read τῇ for τῶν in l. 32 with codd. c, d, m, (τὸ C), and Waitz.

not convertible with it : e. g. let *A* stand for courage, *B* for large extremities, and *C* for lion. *B* then belongs to every- 35 thing to which *C* belongs, but also to others. But *A* belongs to everything to which *B* belongs, and to nothing besides, but is convertible with *B* : otherwise, there would not be a single sign correlative with each affection.

G. R. G. MURE, M.A.

FELLOW AND TUTOR OF MERTON COLLEGE

PREFACE

I DOUBT whether I should have undertaken to translate the Posterior Analytics had I not been encouraged by a promise of assistance from Professor Joachim. That promise he has most generously fulfilled, and if this translation has any value it is largely because it embodies an amount of his constructive criticism far too great for detailed acknowledgement. I have, however, also received a number of valuable suggestions from the Editor, and the errors from which these two scholars were unable to save me probably constitute the remainder of the book.

I have taken Bekker's text as a foundation, noting departures from it, and in this connexion I have to thank Professor J. A. Smith for the gift of a photograph of Cod. A of the Posterior Analytics. The notes are perhaps too numerous for a translation, certainly too few to form anything resembling a commentary. I have not known how to avoid this compromise.

Finally my thanks are due to the late Mr. H. Beighton, who read about half the proofs and made several suggestions which I have adopted, and to Mr. Joseph of New College for the loan of his notes on Professor Cook Wilson's lectures on the Posterior Analytics.

October 5, 1925.

CONTENTS

BOOK I

CHAP.

1. The student's need of pre-existent knowledge. Its nature.
2. The nature of scientific knowledge. The conditions of demonstration. The meaning of Contradiction, Enunciation, Proposition, Basic truth, Thesis, Axiom, Hypothesis, Definition.
3. Two erroneous views of scientific knowledge. The futility of circular demonstration.
4. Types of attribute: 'True in every instance', 'Essential', 'Commensurate and universal', 'Accidental'.
5. Causes through which we erroneously suppose a conclusion commensurate and universal when it is not. How to avoid this error.
6. The premisses of demonstration must be necessary and essential.
7. The premisses and conclusion of a demonstration must fall within a single genus. The three constituent elements of demonstration.
8. Only eternal connexions can be demonstrated.
9. Demonstration must proceed from the basic premisses peculiar to each science, except in the case of subalternate sciences.
10. The different sorts of basic truth.
11. The function of the common axioms in demonstration.
12. The scientific premiss in interrogative form. Formal fallacy. The growth of a science.
13. The difference between knowledge of the fact and knowledge of the reasoned fact.
14. The first figure is the true type of scientific syllogism.
15. Immediate negative propositions.
16. Ignorance as erroneous inference when the premisses are immediate.
17. Ignorance as erroneous inference when the premisses are mediate.
18. Ignorance as the negation of knowledge, e.g. such as must result from the lack of a sense.
19. Can demonstration develop an indefinite regress of premisses, (1) supposing the primary attribute fixed? (2) supposing the ultimate subject fixed? (3) supposing both primary attribute and ultimate subject fixed?
20. If (1) and (2) are answered negatively, the answer to (3) must be in the negative.
21. If affirmative demonstration cannot develop an indefinite regress, then negative demonstration cannot.

CONTENTS

CHAP.

22. Dialectical and analytic proofs that the answer to both (1) and (2) is in the negative.
23. Corollaries.
24. The superiority of universal to particular demonstration.
25. The superiority of affirmative to negative demonstration.
26. The superiority of affirmative and negative demonstration to *reductio ad impossibile*.
27. The more abstract science is the prior and the more accurate science.
28. What constitutes the unity of a science.
29. How there may be several demonstrations of one connexion.
30. Chance conjunctions are not demonstrable.
31. There can be no demonstration through sense-perception.
32. Different sciences must possess different basic truths.
33. The relation of opinion to knowledge.
34. Quick wit : the faculty of instantaneously hitting upon the middle term.

BOOK II

1. The four possible forms of inquiry.
2. They all concern the middle term.
3. The difference between definition and demonstration.
4. Essential nature cannot be demonstrated.
5. Essential nature cannot be inferred by division.
6. Attempts to prove a thing's essential nature either hypothetically or through the definition of its contrary beg the question.
7. Definition does not touch the question of existence ; demonstration proves existence. Hence definition cannot demonstrate.
8. Yet only demonstration can reveal the essential nature of things which have a cause other than themselves—i.e. attributes.
9. That which is self-caused—the basic premisses—is grasped immediately.
10. Types of definition.
11. The several causes as middle terms.
12. The question of time in causal inference.
13. How to obtain the definition of a substance. The use of division for this purpose.
14. How to select a connexion for demonstration.
15. One middle will often serve to prove several connexions.
16. If the effect is present, is the cause also present? Plurality of causes is impossible where cause and effect are commensurate.
17. Different causes may produce the same effect, but not in things specifically identical.
18. The true cause of a connexion is the proximate and not the more universal cause.
19. How the individual mind comes to know the basic truths.

ANALYTICA POSTERIORA

BOOK I

I ALL instruction given or received by way of argument 71^a
proceeds from pre-existent knowledge. This becomes
evident upon a survey of all the species of such instruction.
The mathematical sciences and all other speculative disci-
plines are acquired in this way, and so are the two forms of
dialectical reasoning, syllogistic and inductive; for each 5
of these latter makes use of old knowledge to impart new,
the syllogism assuming an audience that accepts its premisses,
induction¹ exhibiting the universal as implicit in the clearly
known particular. Again, the persuasion exerted by rhe-
torical arguments is in principle the same, since they use
either example, a kind of induction, or enthymeme, a form 10
of syllogism.

The pre-existent knowledge required is of two kinds.
In some cases admission of the fact must be assumed, in
others comprehension of the meaning of the term used, and
sometimes both assumptions are essential. Thus, we assume
that every predicate can be either truly affirmed or truly
denied of any subject,² and that 'triangle'³ means so and
so; as regards 'unit' we have to make the double assump-
tion of the meaning of the word and the existence of the 15
thing. The reason is that these several objects are not equally
obvious to us. Recognition of a truth may in some cases

¹ The sense of *ἐπαγωγή* implied in the use of *ἐπαγωγὴ* by Aristotle is probably that of 'leading the pupil on' from the particular to the universal by making him recognize the latter as implicit in the former.

² i.e. the law of excluded middle.

³ Elsewhere *τρίγωνον* as a rule appears as one of the subjects of which the geometer assumes the meaning and being and demonstrates properties: here it seems to be instanced as a property, of which only the meaning is assumed. This chapter is, however, preliminary, and probably Aristotle is only drawing the distinction, which appears in ch. 10, 76^b 16 ff., between tacit and explicit assumptions. Possibly, however, Aristotle is thinking of 'triangular' as an attribute of number, cf. note on 73^a 40, or as a particular modification of *σημεῖα καὶ γραμμαί*, the *πρῶτα* of space.

contain as factors both previous knowledge and also knowledge acquired simultaneously with that recognition—knowledge, this latter, of the particulars actually falling under the universal and therein already virtually known. For example, the student knew beforehand that the angles
 20 of every triangle are equal to two right angles; but it was only at the actual moment at which he was being led on to recognize this as true in the instance before him that he came to know ‘this figure inscribed in the semicircle’ to be a triangle.¹ For some things (viz. the singulars finally reached which are not predicable of anything else as subject) are only learnt in this way, i.e. there is here no recognition through a middle of a minor term as subject to a major. Before he was led on to recognition or before he actually
 25 drew a conclusion, we should perhaps say that in a manner he knew, in a manner not.

If he did not in an unqualified sense of the term *know* the existence of this triangle, how could he *know* without qualification that its angles were equal to two right angles? No: clearly he *knows* not without qualification but only in the sense that he *knows* universally. If this distinction is not drawn, we are faced with the dilemma in the *Meno*.² either a man will learn nothing or what he already knows,
 30 for we cannot accept the solution which some people offer. A man is asked, ‘Do you, or do you not, know that every pair is even?’ He says he does know it. The questioner then produces a particular pair, of the existence, and so *a fortiori* of the evenness, of which he was unaware. The solution which some people offer is to assert that they do not know that every pair is even, but only that everything

¹ Though he uses syllogistic terms, Aristotle is hardly describing syllogism, but rather the conversion of a universal known *ἐξεί* into actual knowledge. The ‘major premiss’ here is a previously known universal (in Aristotle’s example ‘the angles of all triangles are together equal to two right angles’), the ‘minor’ is the recognition of a singular (in the example, ‘this is a triangle’), and the ‘conclusion’, with which the minor is simultaneous, is the recognition of this singular as an instance embodying the universal (‘the angles of this triangle in the semi-circle are equal to two right angles’). Hence *ὅν ἐχει τὴν γνώσιν* in * 19 refers to *ᾧσα*, and means ‘the singulars of which he has knowledge as a *ἐξεί* is in that he knows the universal’.

² Plato, *Meno*, 80 E.

which they know to be a pair is even: yet what they know 71^b
to be even is that of which they have demonstrated evenness,
i.e. what they made the subject of their premiss, viz. not
merely every triangle or number which they know to be
such, but any and every number or triangle without reserva-
tion. For no premiss is ever couched in the form 'every
number which you know to be such', or 'every rectilinear
figure which you know to be such': the predicate is always
construed as applicable to any and every instance of the 5
thing. On the other hand, I imagine there is nothing to
prevent a man in one sense knowing what he is learning, in
another not knowing it. The strange thing would be, not
if in some sense he knew what he was learning, but if he
were to know it in that precise sense and manner in which
he was learning it.¹

- 2 We suppose ourselves to possess unqualified scientific
knowledge of a thing, as opposed to knowing it in the
accidental way in which the sophist knows, when we think 10
that we know the cause on which the fact depends, as the
cause of that fact and of no other, and, further, that the fact
could not be other than it is. Now that scientific knowing is
something of this sort is evident—witness both those who
falsely claim it and those who actually possess it, since the
former merely imagine themselves to be, while the latter are
also actually, in the condition described. Consequently the
proper object of unqualified scientific knowledge is something 15
which cannot be other than it is.

There may be another manner of knowing as well—that
will be discussed later.² What I now assert is that at all
events we do know by demonstration. By demonstration
I mean a syllogism productive of scientific knowledge, a
syllogism, that is, the grasp of which is *eo ipso* such knowledge.
Assuming then that my thesis as to the nature of scientific
knowing is correct, the premisses of demonstrated knowledge 20
must be true, primary, immediate, better known than and
prior to the conclusion, which is further related to them as
effect to cause. Unless these conditions are satisfied, the

¹ Cf. *An. Pr.* ii, ch. 21.

² Cf. the following chapter and more particularly ii, ch. 19.

basic truths will not be 'appropriate'¹ to the conclusion. Syllogism there may indeed be without these conditions, but such syllogism, not being productive of scientific knowledge, will not be demonstration. The premisses must be
 25 true: for that which is non-existent cannot be known—we cannot know, e.g., that the diagonal of a square is commensurate with its side.² The premisses must be primary and indemonstrable; otherwise they will require demonstration in order to be known, since to have knowledge, if it be not accidental knowledge, of things which are demonstrable, means precisely to have a demonstration of them. The premisses must be the causes of the conclusion, better known
 30 than it, and prior to it; its causes, since we possess scientific knowledge of a thing only when we know its cause; prior, in order to be causes; antecedently known, this antecedent knowledge being not our mere understanding of the meaning, but knowledge of the fact as well.³ Now 'prior' and 'better known' are ambiguous terms, for there is a difference between what is prior and better known in the order of
 72^a being and what is prior and better known to man. I mean that objects nearer to sense are prior and better known to man; objects without qualification prior and better known are those further from sense. Now the most universal causes⁴ are furthest from sense and particular causes are
 5 nearest to sense, and they are thus exactly opposed to one another. In saying that the premisses of demonstrated knowledge must be primary, I mean that they must be the 'appropriate' basic truths, for I identify primary premiss and basic truth. A 'basic truth' in a demonstration is an immediate proposition. An immediate proposition is one which has no other proposition prior to it. A proposition is either part of an enunciation, i.e. it predicates a single

¹ i.e. within the same genus. Cf. i, ch. 7.

² Within the conditions of ἀπόδειξις here laid down, false premisses would give a false conclusion corresponding to a μὴ ὂν ὡς ψεῦδος such as διάμετρος—σύμμετρος, which is not anything ἐν τοῖς πράγμασιν. Such a μὴ ὂν cannot be the object of demonstration.

³ Cf. 71^a 11 ff. False ἀπόδειξις is a contradiction in terms. Though false premisses may yield a true conclusion, a syllogism in which this occurs is not ἀπόδειξις but gives only the ὅτι: cf. *An. Pr.* ii. 2. 53^b 7–10.

⁴ 'Magis universalia in causando', Zabarella. Cf. 76^a 19 and 85^b 24.

attribute of a single subject. If a proposition is dialectical, it assumes either part indifferently; if it is demonstrative, it 10 lays down one part to the definite exclusion of the other because that part is true. The term 'enunciation' denotes either part of a contradiction indifferently. A contradiction is an opposition which of its own nature excludes a middle. The part of a contradiction which conjoins a predicate with a subject is an affirmation; the part disjoining them is a negation. I call an immediate basic truth of syllogism a 'thesis' when, though it is not 15 susceptible of proof by the teacher, yet ignorance of it does not constitute a total bar to progress on the part of the pupil: one which the pupil must know if he is to learn anything whatever is an axiom. I call it an axiom because there are such truths and we give them the name of axioms *par excellence*.¹ If a thesis assumes one part or the other of an enunciation, i.e. asserts either the existence or the 20 non-existence of a subject, it is a hypothesis;² if it does not so assert, it is a definition. Definition *is* a 'thesis' or a 'laying something down', since the arithmetician lays it down that to be a unit is to be quantitatively indivisible; but it is not a hypothesis, for to define what a unit is is not the same as to affirm its existence.

Now since the required ground of our knowledge—i.e. of 25 our conviction³—of a fact is the possession of such a syllogism as we call demonstration, and the ground of the syllogism is the facts constituting its premisses, we must not only know the primary premisses—some if not all of them—beforehand, but know them better than the conclusion: for the cause of an attribute's inherence in a subject always itself inheres in the subject more firmly than that attribute; e.g. the cause of our loving anything is dearer to us than the object of our love. So since the primary premisses are the cause 30

¹ *sc.* because the quantitative axioms—ignorance of which is a bar only to *mathematical* knowledge—are also called axioms.

² 'Hypothesis' to Aristotle and Plato means an assumption not calling for proof within the sphere of the special science in which it functions, not a 'working hypothesis'.

³ For Aristotle's view of the relation of belief to knowledge see i, ch. 33.

of our knowledge—i. e. of our conviction—it follows that we know them better—that is, are more convinced of them—than their consequences, precisely because our knowledge of the latter is the effect of our knowledge of the premisses. Now a man cannot believe in anything more than in the things he knows, unless he has either actual knowledge of it or something better than actual knowledge. But we are
 35 faced with this paradox if a student whose belief rests on demonstration has not prior knowledge;¹ a man must believe in some, if not in all, of the basic truths more than in the conclusion. Moreover, if a man sets out to acquire the scientific knowledge that comes through demonstration, he must not only have a better knowledge of the basic truths and a firmer conviction of them than of the connexion
 72^b which is being demonstrated: more than this, nothing must be more certain or better known to him than these basic truths in their character as contradicting the fundamental premisses which lead to the opposed and erroneous conclusion.² For indeed the conviction of pure science must be unshakable.

5 Some hold that, owing to the necessity of knowing the 3 primary premisses, there is no scientific knowledge. Others think there is, but that all truths are demonstrable. Neither doctrine is either true or a necessary deduction from the premisses. The first school, assuming that there is no way

¹ I take *τις . . . τῶν δι' ἀπόδειξιν πιστευόντων* in * 35 as a periphrasis meaning 'a man convinced by demonstration' (the traditional interpretation), though the construction is harsh. Zabarella suggests that in L 37 *τῶν δὲ μέλλοντα . . .* Aristotle passes from a dialectical proof applicable to all syllogisms to a strict proof confined to *ἀπόδειξις*, observing that *ἐπίστασθαι, ἐπιστήμη* do not occur in the immediately preceding passage. Prof. Joachim suggests to me that *εἰ μὴ τις . . . πιστευόντων* may mean 'unless a man knows the premisses before those who believe them owing to a demonstration'—i. e. 'before anyone demonstrates them to him'—but suspects the text. Aristotle clearly intends a contrast between (a) those convinced—e. g. of a particular truth—*δι' ἀπόδειξιν*, and (b) those who set out to acquire the scientific knowledge that comes by demonstration. The former to be convinced by demonstration must be more convinced of the premisses than of the conclusion, but of the latter even more is required, since their conviction must be unshakable.

² To read *ἀντὶ τῶν* with M in 72^b 1 and *ὥς* for *τῶν* in b 2 would assist this interpretation.

of knowing other¹ than by demonstration, maintain that an infinite regress is involved, on the ground that if behind the prior stands no primary we could not know the posterior through the prior where'n they are right, for one cannot traverse an infinite series²: if on the other hand—they say—the series terminates and there are primary premisses, yet these are indemonstrable because incapable of demonstration which according to them is the only form of knowledge. And since thus we cannot know the primary premisses, knowledge of the conclusions which follow from them is not pure scientific knowledge nor properly knowing at all, but rests on the mere supposition that the premisses are true. The other party agree with them as regards knowing, holding that it is only possible by demonstration, but they see no difficulty in holding that all truths are demonstrated, on the ground that demonstration may be circular and reciprocal.

Our own doctrine is that not all knowledge is demonstrative: on the contrary, knowledge of the immediate premisses is independent of demonstration. (The necessity of this is obvious, for since we must know the prior premisses from which the demonstration is drawn, and since the regress must end in immediate truths, those truths must be indemonstrable. Such, then, is our doctrine, and in addition we maintain that besides scientific knowledge there is its originaive source which enables us to recognize the definitions³

Now demonstration must be based on premisses prior to and better known than the conclusion; and the same things cannot simultaneously be both prior and posterior to one another: so circular demonstration is clearly not possible in the unqualified sense of 'demonstration', but only possible if 'demonstration' be extended to include that other method of argument which rests on a distinction between truths prior to us and truths without qualification prior, i.e. the

¹ Reading *ἄλλος* with A, B, C.

² Zabarella takes *ἔργου* as meaning 'definitions' = 'middle terms', which in *demonstratio potissima* are elements in the definition of the subjects.

30 method by which induction produces knowledge.¹ But if we accept this extension of its meaning, our definition of unqualified knowledge will prove faulty; for there seem to be two kinds of it. Perhaps, however, the second form of demonstration, that which proceeds from truths better known to us, is not demonstration in the unqualified sense of the term.²

The advocates of circular demonstration are not only faced with the difficulty we have just stated: in addition their theory reduces to the mere statement that if a thing exists, then it does exist—an easy way of proving anything.
 35 That this is so can be clearly shown by taking three terms, for to constitute the circle it makes no difference whether many terms or few or even only two are taken. Thus by direct proof, if *A* is, *B* must be; if *B* is, *C* must be; therefore if *A* is, *C* must be. Since then—by the circular
 73^a proof—if *A* is, *B* must be, and if *B* is, *A* must be, *A* may be substituted for *C* above. Then 'if *B* is, *A* must be' = 'if *B* is, *C* must be', which above gave the conclusion 'if *A* is, *C* must be': but *C* and *A* have been identified.⁴ Con-

¹ Placing a comma after *γνωριμωτερον* in ^b 27, and taking *εἰ μὴ* . . in ^b 28 ff. as qualifying *ἀδύνατον* in ^b 25. Aristotle seems to mean that circular demonstration is impossible unless demonstration is taken to include a type of argument based on truths prior only in the sense of 'prior to us', such as induction, where we grasp the particular and recognize in it the universal, which is however *ἀπλῶς προτερον*. The next sentence, *εἰ δ' οὕτως* . . ., seems to confirm this interpretation, which does, however, involve a verbal contradiction. *οἷον τὰ μὲν πρὸς ἡμᾶς, τὰ δ' ἀπλῶς* may be a marginal gloss crept into the text. The Greek would be less harsh without it.

² *sc.* 'and therefore our definition is not faulty'.

³ *sc.* to constitute the valid syllogism which Aristotle sets up in ^b 37-9 to illustrate the tautology of the circular demonstration when reduced to explicit syllogism.

⁴ *τοῦτο δ' ὅτι τοῦ Α ὄντος το Γ ἔστι* seems to mean that '*B* implies *C*' taken in conjunction with '*A* implies *B*' gave the conclusion '*A* implies *C*'. Aristotle tries to show the circular proof tautologous by reducing it to syllogism, apparently arguing thus: '*B* implies *C*', '*A* implies *B*', ∴ '*A* implies *C*' is valid syllogism (a *schema* for comparison): while according to the circular proof *A* necessitates *B* and *B* necessitates *A*. If *A-B*, *B-A* ('*A* implies *B*', '*B* implies *A*') are to be made the premisses of a syllogism, there is nothing but *A* to take the place of *C* in the *schema*—no major term different from the minor ∴ *B-A* is all we have to fill the place of the major premiss *B-C*. Now, in the *schema*, *B-C* (taken in conjunction with the minor premiss *A-B*, which is common to both syllogisms) gave the conclusion *A-C*. But *C* is now *A* (a restatement of the fact that *B-C* has become *B-A*). Therefore the conclusion is *A-A*.

sequently the upholders of circular demonstration are in the position of saying that if *A* is, *A* must be—a simple way of 5 proving anything. Moreover, even such circular demonstration is impossible except in the case of attributes that imply one another, viz. 'peculiar' ¹ properties.

Now, it has been shown that the positing of one thing—be it one term or one premiss—never involves a necessary consequent: ² two premisses constitute the first and smallest 10 foundation for drawing a conclusion at all and therefore *a fortiori* for the demonstrative syllogism of science. If, then, *A* is implied in *B* and *C*, and *B* and *C* are reciprocally implied in one another and in *A*, it is possible, as has been shown in my writings on the syllogism, ³ to prove all the assumptions on which the original conclusion rested, by circular demonstration in the first figure. But it has also 15 been shown that in the other figures either no conclusion is possible, or at least none which proves both the original premisses. ⁴ Propositions the terms of which are not convertible cannot be circularly demonstrated at all, and since convertible terms occur rarely in actual demonstrations, it is clearly frivolous and impossible to say that demonstration is reciprocal and that therefore everything can be demon- 20 strated.

- 4 Since the object of pure scientific knowledge cannot be other than it is, the truth obtained by demonstrative knowledge will be necessary. And since demonstrative knowledge is only present when we have a demonstration, it follows that demonstration is an inference from necessary premisses. So we must consider what are the premisses of demonstration—i.e. what is their character: and as a 25 preliminary, let us define what we mean by an attribute 'true in every instance of its subject', an 'essential'

¹ τὸ ἴδιον is defined in *Top.* i. 102^a 18 as ὁ μὴ δηλοῖ μὲν τὸ τί ἦν εἶναι, μὴν δ' ὑπάρχει καὶ ἀντικατηγορεῖται τοῦ πράγματος. τὰ ἴδια in this sense are in fact τὰ καθ' αὐτὰ συμβεβηκότα as Aristotle elsewhere calls them: but Aristotle often uses ἴδιον more widely to include also elements in the τί ἦν εἶναι and even as in *An. Post.* ii, ch. 6. 92^a 8 to differentiate these from other characters of a substance.

² *An. Pr.* i, ch. 25.

³ *Ibid.* ii, ch. 5.

⁴ *Ibid.* ii, cc. 5 and 6.

attribute, and a 'commensurate and universal'¹ attribute. I call 'true in every instance' what is truly predicable of all instances— not of one to the exclusion of others—and at all times, not at this or that time only; e. g. if animal is
 30 truly predicable of every instance of man, then if it be true to say 'this is a man', 'this is an animal' is also true, and if the one be true now the other is true now. A corresponding account holds if point is in every instance predicable as contained in line. There is evidence for this in the fact that the objection we raise against a proposition put to us as true in every instance is either an instance in which, or an occasion on which, it is not true. Essential attributes are (1) such as belong to their subject as elements
 35 in its essential nature (e. g. line thus belongs to triangle, point to line; for the very being or 'substance' of triangle and line is composed of these elements, which are contained in the formulae defining triangle and line): (2) such that, while they belong to certain subjects, the subjects to which they belong are contained in the attribute's own defining formula. Thus straight and curved belong to line, odd and
 40 even, prime and compound, square and oblong, to number;²
 73^b and also the formula defining any one of these attributes contains its subject—e. g. line or number as the case may be.

Extending this classification to all other attributes, I distinguish those that answer the above description as belonging essentially to their respective subjects; whereas attributes related in neither of these two ways to their subjects I call accidents or 'coincident';³ e. g. musical or white is a 'coincident' of animal.

5 Further (a) that is essential which is not predicated of a subject other than itself: e. g. 'the walking [thing]' walks

¹ καθόλου is not always used by Aristotle in the strict sense here defined. It has therefore seemed advisable to add 'commensurate' in translating it where it is used in the strict sense.

² The reference is to a method of naming numbers according to the geometrical arrangements of which their units are capable. Cf. Plato, *Theaetetus*, 147 E–148 B.

³ συμβεβηκός is elsewhere except in i, cc. 19 and 22 translated 'accident', which less adequately covers the sense of the word here and in that chapter. For the meaning expressed by 'coincident' cf. 81^b 28–29.

and is white in virtue of being something else besides;¹ whereas substance, in the sense of whatever signifies a 'this somewhat',² is not what it is in virtue of being something else besides. Things, then, not predicated of a subject I call essential; things predicated of a subject I call accidental or 'coincidental'.

In another sense again (*b*) a thing consequentially³ connected with anything is essential; one not so connected is 'coincidental'. An example of the latter is 'While he was walking it lightened': the lightning was not due to his walking; it was, we should say, a coincidence. If, on the other hand, there is a consequential connexion, the predication is essential; e.g. if a beast dies when its throat is being cut, then its death is also essentially connected with the cutting, because the cutting was the cause of death, not¹⁵ death a 'coincident' of the cutting.

So far then as concerns the sphere of connexions scientifically known in the unqualified sense of that term, all attributes which (within that sphere) are essential either in the sense that their subjects are contained in them, or in the sense that they are contained in their subjects, are necessary as well as consequentially connected with their subjects.⁴ For it is impossible for them not to inhere in their subjects—either simply or in the qualified sense that one or other of a pair of opposites must inhere in the subject; e.g. in line must be either straightness or curvature,²⁰ in number either oddness or evenness. For within a single identical genus the contrary of a given attribute is either its privative or its contradictory; e.g. within number what is not odd is even, inasmuch as within this sphere even is a

¹ *sc.* the unexpressed subject. Aristotle's point cannot be rendered in English, which seldom uses an adjective or participle substantially. Cf. *Met. z*, ch. 10, where Aristotle distinguishes τὸ λευκόν from the πάθος λευκότης.

² i.e. any *this* which is designable as characterized under the Category of Substance. Cf. Prof. J. A. Smith in *Class. Rev.*, vol. xxxv, p. 19.

³ δὲ αὐτό implies a connexion really wider than causation, and would include e.g. the inherence of mathematical properties.

⁴ So Zabarella and Pacius, taking Aristotle's meaning to be that only types (1) and (2) have the degree of necessity requisite for scientific knowledge—a view borne out by i, ch. 22, 84^a 7-28.

necessary consequent of not-odd. So, since any given predicate must be either affirmed or denied of any subject,¹ essential attributes must inhere in their subjects of necessity.²

25 Thus, then, we have established the distinction between the attribute which is 'true in every instance' and the 'essential' attribute.

I term 'commensurately universal' an attribute which belongs to every instance of its subject, and to every instance essentially and as such; from which it clearly follows that all commensurate universals inhere *necessarily* in their subjects. The essential attribute, and the attribute that belongs to its subject as such, are identical. E.g. point
30 and straight belong to line essentially, for they belong to line as such; and triangle as such has two right angles, for it is *essentially* equal to two right angles.

An attribute belongs commensurately and universally to a subject when it can be shown to belong to any random instance of that subject and when the subject is the first thing to which it can be shown to belong. Thus, e.g., (1) the equality of its angles to two right angles is not a commensurately universal attribute of figure. For though it
35 is possible to show that a figure has its angles equal to two right angles, this attribute cannot be demonstrated of any figure selected at haphazard, nor in demonstrating does one take a figure at random—a square is a figure but its angles are not equal to two right angles. On the other hand, any isosceles triangle has its angles equal to two right angles, yet isosceles triangle is not the primary subject of this attribute but triangle is prior. So whatever can be shown

¹ i. e. the law of excluded middle.

² Aristotle argues as follows: Essential attributes of type (2) which inhere in their subjects as disjunctive pairs of opposites are necessary because the disjunction covers the whole ground of the subject. The disjunction covers the whole ground because the subject is within a single genus, and the law of excluded middle here 'invests the contrary with the character of the contradictory' or privative—i. e. though this law only entitles you either to affirm or deny a predicate, yet here the affirmation of one predicate is *ipso facto* the denial of its opposite and vice versa: 'number is odd or not-odd' must mean 'number is odd or even'; 'animal is seeing or not-seeing' is identical with 'animal is seeing or blind'.

to have its angles equal to two right angles, or to possess 40
any other attribute, in any random instance of itself and
primarily—that is the first subject to which the predicate in
question belongs commensurately and universally, and the 74^a
demonstration, in the essential sense, of any predicate is
the proof of it as belonging to this first subject commensurately and universally: while the proof of it as belonging
to the other subjects to which it attaches is demonstration
only in a secondary and unessential sense. Nor again (2)
is equality to two right angles a commensurately universal
attribute of isosceles; it is of wider application.¹

- 5 We must not fail to observe that we often fall into error
because our conclusion is not in fact primary and commen- 5
surately universal in the sense in which we think we prove
it so. We make this mistake (1) when the subject is an
individual or individuals above which there is no universal
to be found: (2) when the subjects belong to different
species and there is a higher universal, but it has no name:
(3) when the subject which the demonstrator takes as
a whole is really only a part of a larger whole; for then
the demonstration will be true of the individual instances 10
within the part and will hold in every instance of it, yet the
demonstration will not be true of this subject primarily and
commensurately and universally. When a demonstration
is true of a subject primarily and commensurately and
universally, that is to be taken to mean that it is true of
a given subject primarily and as such. Case (3) may be
thus exemplified. If a proof were given that perpendiculars
to the same line are parallel, it might be supposed that *lines*
thus perpendicular were the proper subject of the demon-
stration because being parallel is true of every instance
of them. But it is not so, for the parallelism depends not 15
on these angles being equal to one another because each is
a right angle, but simply on their being equal to one
another. An example of (1) would be as follows: if
isosceles were the only triangle, it would be thought to

¹ If οὐδέ in ^a 2 is the right reading, it seems necessary to regard
καίτοι (73^b 34) . . . καθ' αὐτό (74^a 2) as a parenthesis, however clumsy.
In ^b 36 I place a comma after σχήματος.

have its angles equal to two right angles *qua* isosceles. An instance of (2) would be the law that proportionals alternate.¹ Alternation used to be demonstrated separately of numbers, lines, solids, and durations,² though it could
 20 have been proved of them all by a single demonstration. Because there was no single name to denote that in which numbers, lengths, durations, and solids are identical, and because they differed specifically from one another, this property was proved of each of them separately. To-day, however, the proof is commensurately universal, for they do not possess this attribute *qua* lines or *qua* numbers, but *qua* manifesting this generic character which they are postulated
 25 as possessing universally. Hence, even if one prove of each kind of triangle that its angles are equal to two right angles, whether by means of the same or different proofs; still, as long as one treats separately equilateral, scalene, and isosceles, one does not yet know, except sophistically, that triangle has its angles equal to two right angles, nor does one yet know that triangle has this property commensurately and universally, even if there is no other species
 30 of triangle but these. For one does not know that triangle as such has this property, nor even that 'all' triangles have it—unless 'all' means 'each taken singly': if 'all' means 'as a whole class', then, though there be none in which one does not recognize this property, one does not know it of 'all triangles'.

When, then, does our knowledge fail of commensurate universality, and when is it unqualified knowledge? If triangle be identical in essence with equilateral, i.e. with each or all equilaterals, then clearly we have unqualified knowledge:³ if on the other hand it be not, and the attribute belongs to equilateral *qua* triangle; then our
 35 knowledge fails of commensurate universality. 'But', it will be asked, 'does this attribute belong to the subject of which

¹ i.e. the law by which if $A : B :: C : D$, then $A : C :: B : D$.

² The reference is perhaps to χρόνοι as the time-units of music and metre.

³ *sc.* of the attribute 'equal to two right angles' which, known to inhere in equilateral, would then be known to inhere in a primary subject, i.e. fully known.

it has been demonstrated *qua* triangle or *qua* isosceles? What is the point at which the subject to which it belongs is primary? (i. e. to what subject can it be demonstrated as belonging commensurately and universally?)' Clearly this point is the first term in which it is found to inhere as the elimination of inferior *differentiae* proceeds. Thus the angles of a brazen isosceles triangle are equal to two right angles: but eliminate brazen and isosceles and the attribute remains. 'But'—you may say—'eliminate figure or limit, 74^b and the attribute vanishes.' True, but figure and limit are not the first *differentiae* whose elimination destroys the attribute. 'Then what is the first?' If it is triangle, it will be in virtue of triangle that the attribute belongs to all the other subjects of which it is predicable, and triangle is the subject to which it can be demonstrated as belonging commensurately and universally.

- 6 Demonstrative knowledge must rest on necessary basic truths; for the object of scientific knowledge¹ cannot be other than it is. Now attributes attaching essentially to their subjects attach necessarily to them: for essential attributes are either elements in the essential nature of their subjects, or contain their subjects as elements in their own essential nature. (The pairs of opposites which the latter class includes are necessary because one member or the other necessarily inheres.) It follows from this that premisses of the demonstrative syllogism must be connexions essential in the sense explained: for all attributes must inhere essentially or else be accidental, and accidental attributes are not necessary to their subjects.

We must either state the case thus, or else premise that the conclusion of demonstration is necessary² and that a demonstrated conclusion cannot be other than it is, and then infer that the conclusion must be developed from necessary premisses. For though you may reason from true premisses without demonstrating, yet if your premisses are necessary you will assuredly demonstrate—in such necessity

¹ i. e. that which is known by demonstration.

² Reading *ἀναγκαῖον*.

you have at once a distinctive character of demonstration. That demonstration proceeds from necessary premisses is also indicated by the fact that the objection we raise against a professed demonstration is that a premiss of it
 20 is not a necessary truth—whether we think it altogether devoid of necessity, or at any rate so far as our opponent's previous argument goes. This shows how naïve it is to suppose one's basic truths rightly chosen if one starts with a proposition which is (1) popularly accepted and (2) true, such as the sophists' assumption that to know is the same as to possess knowledge.¹ For (1) popular acceptance or rejection is no criterion of a basic truth, which can only be the primary law of the genus constituting the subject matter
 25 of the demonstration; and (2) not *all* truth is 'appropriate'.²

A further proof that the conclusion must be the development of necessary premisses is as follows. Where demonstration is possible, one who can give no account which includes the cause has no scientific knowledge. If, then, we suppose a syllogism in which, though *A* necessarily inheres in *C*, yet *B*, the middle term of the demonstration, is not necessarily connected with *A* and *C*, then the man who argues
 30 thus has no reasoned knowledge of the conclusion, since this conclusion does not owe its necessity to the middle term; for though the conclusion is necessary, the mediating link is a contingent fact. Or again, if a man is without knowledge now, though he still retains the steps of the argument, though there is no change in himself or in the fact and no lapse of memory on his part; then neither had he knowledge previously. But the mediating link, not being necessary,
 35 may have perished in the interval; and if so, though there be no change in him nor in the fact, and though he will still retain the steps of the argument, yet he has not knowledge, and therefore had not knowledge before. Even if the link has not actually perished but is liable to perish, this situation is possible and might occur. But such a condition cannot be knowledge.

75^a When the conclusion is necessary, the middle through which it was proved may yet quite easily be non-necessary.

¹ Plato, *Euthydemus*, 277 B.

² Cf. note on 71^b 23.

You can in fact infer the necessary even from a non-necessary premiss, just as you can infer the true from the not true. On the other hand, when the middle is necessary the conclusion must be necessary ; just as true premisses always 5 give a true conclusion. Thus, if *A* is necessarily predicated of *B* and *B* of *C*, then *A* is necessarily predicated of *C*. But when the conclusion is non-necessary the middle cannot be necessary either. Thus: let *A* be predicated non-necessarily of *C* but necessarily of *B*, and let *B* be a 10 necessary predicate of *C* ; then *A* too will be a necessary predicate of *C*, which by hypothesis it is not.

To sum up, then : demonstrative knowledge must be knowledge of a necessary nexus, and therefore must clearly be obtained through a necessary middle term ; otherwise its possessor will know neither the cause nor the fact that his conclusion is a necessary connexion. Either he will mistake 15 the non-necessary for the necessary and believe the necessity of the conclusion without knowing it, or else he will not even believe it—in which case he will be equally ignorant, whether he actually infers the mere fact through middle terms or the reasoned fact and from immediate premisses.¹

Of accidents that are not essential according to our definition of essential there is no demonstrative knowledge ; for since an accident, in the sense in which I here speak of it, 20 may also not inhere, it is impossible to prove its inherence as a necessary conclusion. A difficulty, however, might be raised as to why in dialectic, if the conclusion is not a necessary connexion, such and such determinate premisses should be proposed in order to deal with such and such determinate problems. Would not the result be the same if one asked any questions whatever and then merely stated 25 one's conclusion ? The solution is that determinate questions have to be put, not because the replies to them affirm facts which necessitate facts affirmed by the conclusion, but because these answers are propositions which if the answerer affirm,

¹ So Zabarella, taking Aristotle to mean that you may construct a formally perfect syllogism, inferring the fact, or even the reasoned fact, from what are actually true and necessary premisses ; yet because you do not realize their necessity, you have not knowledge. One would, however, have expected συλλογίζονται for εἰδῆ in ^a 16.

he must affirm the conclusion—and affirm it with truth if they are true.

Since it is just those attributes within every genus which are essential and possessed by their respective subjects as such that are necessary, it is clear that both the conclusions
 30 and the premisses of demonstrations which produce scientific knowledge are essential.¹ For accidents are not necessary: and, further,² since accidents are not necessary one does not necessarily have reasoned knowledge of a conclusion drawn from them (this is so even if the accidental premisses are invariable but not essential, as in proofs through signs;³ for though the conclusion be actually essential, one will not know it as essential nor know its reason); but to have
 35 reasoned knowledge of a conclusion is to know it through its cause. We may conclude that the middle must be consequentially connected with the minor, and the major with the middle.

It follows that we cannot in demonstrating pass from one 7⁴ genus to another. We cannot, for instance, prove geometrical truths by arithmetic. For there are three elements in
 40 demonstration: (1) what is proved, the conclusion—an attribute inhering essentially in a genus; (2) the axioms,⁵
 75^b i.e. axioms which are premisses of demonstration; (3) the subject-genus whose attributes, i.e. essential properties, are revealed by the demonstration. The axioms which are premisses of demonstration may be identical⁶ in two or

¹ The implied minor premiss required for this conclusion is the already proved fact that the conclusions and premisses of demonstration are necessary. I take οὐδ' εἰ * 32—διότι * 34 as a parenthesis.

² A further reason for excluding accidental premisses from demonstration: they cannot give reasoned knowledge of a conclusion, i.e. (* 35) knowledge of it through its cause (and this, Aristotle implies, was one of the first conditions of demonstration. Cf. 71^b 10, 11).

³ Usually proofs from effect to cause, cf. i, ch. 13, 78^a 30 ff.

⁴ Zabarella begins ch. 7 at 75^a 28—perhaps a better division.

⁵ It is not clear whether by εἰς τὸν Aristotle implies that the quantitative axioms can be premisses of demonstration—a view perhaps supported by i, ch. 9, 75^b 40, 41 if the interpretation of Bryson's quadrature of the circle suggested in my note on 76^a 3 is correct—or whether, like such axioms as the laws of contradiction and excluded middle, they are implied as canons regulating all mathematical demonstrations but do not serve as premisses. I have with hesitation adopted the former alternative here and in ch. 10, 76^b 14.

⁶ sc. κατ' ἀναλογίαν

more sciences : but in the case of two different genera such as arithmetic and geometry you cannot apply arithmetical demonstration to the properties of magnitudes unless the 5 magnitudes in question are numbers.¹ How in certain cases transference is possible I will explain later.²

Arithmetical demonstration and the other sciences likewise possess, each of them, their own genera ; so that if the demonstration is to pass from one sphere to another, the genus must be either absolutely or to some extent³ the same. If this is not so, transference is clearly impossible, 10 because the extreme and the middle terms must be drawn from the same genus :⁴ otherwise, as predicated, they will not be essential and will thus be accidents. That is why it cannot be proved by geometry that opposites fall under one science, nor even that the product of two cubes is a cube. Nor can the theorem of any one science be demonstrated by means of another science, unless these theorems are related 15 as subordinate to superior (e. g. as optical theorems to geometry or harmonic theorems to arithmetic). Geometry again⁵ cannot prove of lines any property which they do not possess *qua* lines, i. e. in virtue of the fundamental truths of their peculiar genus : it cannot show, for example, that the straight line is the most beautiful of lines or the contrary of the circle ; for these qualities do not belong to lines in virtue of their peculiar genus, but through some property which it shares with other genera. 20

- 8 It is also clear that if the premisses from which the syllogism proceeds are commensurately universal, the conclusion of such demonstration—demonstration, i. e., in the unqualified sense—must also be eternal. Therefore no attribute can be demonstrated nor known by strictly scientific knowledge to inhere in perishable things. The proof can only be accidental, because the attribute's connexion 25 with its perishable subject is not commensurately universal

¹ Cf. *Met.* 1039^a 9.

² Cf. i, cc. 9 and 13.

³ i. e. in the case of subalternate sciences : cf. e. g. 75^b 15 ff.

⁴ *sc.* 'in all the demonstrations of the science.'

⁵ Aristotle has given two examples of the vicious transference of a middle term from one science to another : he now gives two examples of the vicious transference of a complete major premiss.

but temporary and special. If such a demonstration is made, one premiss must be perishable and not commensurately universal (perishable¹ because only if it is perishable will the conclusion be perishable ; not commensurately universal, because the predicate will be predicable of some instances of the subject and not of others) ; so that the conclusion can only be that a fact is true at the moment—not commensurately and universally. The same is true of definitions, since a definition is either a primary premiss² or a conclusion of a demonstration, or else only differs from a demonstration in the order of its terms. Demonstration and science of merely frequent occurrences—e. g. of eclipse as happening to the moon—are, as such,³ clearly eternal : whereas so far as they are not eternal they are not fully commensurate.⁴

35 Other subjects too have properties attaching to them in the same way as eclipse attaches to the moon.

It is clear that if the conclusion is to show an attribute inhering as such, nothing can be demonstrated except from its 'appropriate'⁵ basic truths. Consequently a proof even from true, indemonstrable, and immediate premisses does not constitute knowledge. Such proofs are like Bryson's method of squaring the circle ; for they operate by taking as their middle a common character—a character, therefore, which the subject may share with another—and consequently they apply equally to subjects different in kind. They therefore afford knowledge of an attribute only as inhering accidentally, not as belonging to its subject as such : otherwise they would not have been applicable to another genus.⁶

¹ Taking *φθαρτὴν μὲν . . . ἐφ' ὧν* as a parenthesis.

² i. e. the minor premiss in a basic syllogism of a science. Cf. ii. ch. 10.

³ *sc.* 'as far as they are demonstration and science'—the thesis which the chapter establishes. In so far as eclipse, demonstrated through its proximate cause, is regarded as embodying an unalterable nexus of cause and effect, the demonstration is genuine demonstration.

⁴ In so far as the eclipse so demonstrated is a particular event, the demonstration is not fully commensurate and so not truly universal.

⁵ Cf. note on 71^b 23.

⁶ The usual explanation of Bryson's method, viz. that he argued that a circle is the mean area between the areas of the circumscribed and inscribed squares, renders it improbably futile. A more probable account (cf. Heath, *Greek Mathematics*, vol. i. 223–5) is as follows : Bryson circumscribed regular polygons about a circle and inscribed

Our knowledge of any attribute's connexion with a subject is accidental unless we know that connexion through the middle term in virtue of which it inheres, and as an inference from basic premisses essential and 'appropriate' to the subject—unless we know, e. g., the property of possessing angles equal to two right angles as belonging to that subject in which it inheres essentially, and as inferred from basic premisses essential and 'appropriate' to that subject; so that if that middle term also belongs essentially to the minor, the middle must belong to the same kind as the major and minor terms. The only exceptions to this rule are such cases as theorems in harmonics which are demonstrable by arithmetic. Such theorems are proved by the same middle terms as arithmetical properties, but with a qualification—the fact falls under a separate science (for the subject genus is separate), but the reasoned fact concerns the superior science, to which the attributes essentially belong. Thus, even these apparent exceptions show that no attribute is strictly demonstrable except from its 'appropriate' basic truths, which, however, in the case of these sciences have the requisite identity of character.

It is no less evident that the peculiar basic truths of each inhering attribute are indemonstrable, for basic truths from which they might be deduced would be basic truths of all regular polygons within it, in each case increasing the number of sides so that the area of the resulting polygon more and more nearly approached that of the circle, arguing that eventually the external and internal polygons would approximate so closely that there could be only one polygon mean in area between them, which would consequently coincide in area with the circle. He may then have reasoned thus: 'Things which are greater and less than the same things respectively are equal. The mean polygon is greater than all the internal polygons and less than all the external polygons; so is the circle. therefore they are equal.' Now the axiom contained by the major premiss is true, but requires specification within each science to be effective; e. g. in arithmetic it can only prove a number equal to itself, while in geometry it must be stated as 'Commensurate magnitudes &c.'. The difficulty of this explanation is that in *Soph. Elench.* 172^a 2-7 Aristotle condemns Bryson's quadrature as 'eristic', because it can be extended outside the sphere of geometry altogether; leaving one to suppose that had Bryson reduced the application of the axiom to geometry and stated it as '*Magnitudes* which are, &c.', the proof would have been valid, whereas in fact it requires a further reduction within geometry to connect it with the minor premiss. It is also highly questionable whether Aristotle held that a quantitative axiom could serve as major premiss of demonstration, cf. note on 75^a 42.

that is, and the science to which they belonged would possess universal sovereignty.¹ This is so because he knows better whose knowledge is deduced from higher causes, for his
 20 knowledge is from prior premisses when it derives from causes themselves uncaused: hence, if he knows better than others or best of all, his knowledge would be science in a higher or the highest degree. But, as things are, demonstration is not transferable to another genus, with such exceptions as we have mentioned of the application of geometrical demonstrations to theorems² in mechanics or optics, or of
 25 arithmetical demonstrations to those of harmonics.

It is hard to be sure whether one knows or not; for it is hard to be sure whether one's knowledge is based on the basic truths appropriate to each attribute—the differentia of true knowledge. We think we have scientific knowledge if we have reasoned from true and primary premisses. But that is not so: the conclusion must be homogeneous with
 30 the basic facts of the science.

I call the basic truths of every genus those elements in it 10 the existence of which cannot be proved. As regards both these primary truths and the attributes dependent on them the meaning of the name is assumed. The fact of their existence as regards the primary truths must be assumed; but it has to be proved of the remainder,³ the attributes. Thus we assume the meaning alike of unity, straight, and
 85 triangular; but while as regards unity and magnitude⁴ we assume also the fact of their existence, in the case of the remainder proof is required.

¹ Cf. *Met.* B, cc. 2 and 3. Aristotle must surely mean that there is no such dominant science. This interpretation, however, leaves the relation of science to metaphysics—to which a reference is clearly implied—obscure. Zabarella: 'notandum est Aristotelem non negare metaphysicum posse probare aliarum scientiarum principia, id namque non negari potest; sed solum negare quod in illis scientiis quarum sunt principia, id fieri queat: ex principiis enim metaphysicis possunt probari principia geometrica, non tamen in ipsa geometria sed in metaphysica'; i. e. as opposed to the relation of subalternate sciences. Pacius retains the discussion within the limits of a single science, but not without violence to the text.

² μηχανικός, ὀπτικός, and ἁρμονικός should almost certainly be neuter plurals. ³ sc. the remainder of the genus; *vide* 75^a 42–b 1.

⁴ Unless μέγεθος stands for the genus of which εἶθ' and τρίγωνον are species, the insertion of it is odd—though not without parallel. For τρίγωνον as apparently an attribute *vide* note on 71^a 15.

Of the basic truths used in the demonstrative sciences some are peculiar to each science, and some are common, but common only in the sense of analogous, being of use only in so far as they fall within the genus constituting the province of the science in question.

Peculiar truths are, e.g., the definitions of line and straight ; 40
common truths are such as 'take equals from equals and equals remain'. Only so much of these common truths is required as falls within the genus in question : for a truth of this kind will have the same force even if not used 76^b
generally but applied by the geometer only to magnitudes, or by the arithmetician only to numbers. Also peculiar to a science are the subjects the existence as well as the meaning of which it assumes, and the essential attributes of which it investigates, e.g. in arithmetic units, in geometry points and 5
lines. Both the existence and the meaning of the subjects are assumed by these sciences ; but of their essential attributes only the meaning is assumed. For example arithmetic assumes the meaning of odd and even, square and cube, geometry that of incommensurable, or of deflection or verging¹ of lines, whereas the existence of these attributes is demonstrated by means of the axioms and from previous conclusions 10
as premisses. Astronomy too proceeds in the same way. For indeed every demonstrative science has three elements : (1) that which it posits, the subject genus whose essential attributes it examines ; (2) the so-called axioms, which are primary premisses² of its demonstration ; (3) the attributes, 15
the meaning of which it assumes. Yet some sciences may very well pass over some of these elements ; e.g. we might not expressly posit the existence of the genus if its existence were obvious (for instance, the existence of hot and cold is more evident than that of number) ; or we might omit to assume expressly the meaning of the attributes if it were well understood. In the same way the meaning of axioms, 20
such as 'Take equals from equals and equals remain', is well known and so not expressly assumed.² Nevertheless in the nature of the case the essential elements of demonstration are three: the subject, the attributes, and the basic premisses.²

¹ *Vide* Heath, *Euclid*, vol. i, p. 150.

² Cf. note on 75^a 42.

That which expresses necessary self-grounded fact, and which we must necessarily believe,¹ is distinct both from the hypotheses² of a science and from illegitimate postulate—I say ‘must believe’, because all syllogism, and therefore *a fortiori* demonstration, is addressed not to the spoken
 25 word, but to the discourse within the soul,³ and though we can always raise objections to the spoken word, to the inward discourse we cannot always object. That which is capable of proof but assumed by the teacher without proof is, if the pupil believes and accepts it, hypothesis, though only in a limited sense hypothesis—that is, relatively to the
 30 pupil; if the pupil has no opinion or a contrary opinion on the matter, the same assumption is an illegitimate postulate. Therein lies the distinction between hypothesis and illegitimate postulate: the latter is the contrary of the pupil’s opinion,⁴ demonstrable, but assumed and used without demonstration.

35 The definitions—viz. those which are not expressed as statements that anything is or is not⁵—are not hypotheses: but it is in the premisses of a science that its hypotheses are contained. Definitions require only to be understood, and this is not hypothesis—unless it be contended that the pupil’s hearing is also an hypothesis required by the teacher. Hypotheses, on the contrary, postulate facts on the being of which depends the being of the fact inferred. Nor are
 40 the geometer’s hypotheses false, as some have held, urging that one must not employ falsehood and that the geometer is uttering falsehood *in stating that the line which he draws* is a foot long or straight, when it is actually neither. The
 77^a truth is that the geometer does not draw any conclusion from the being of the particular line of which he speaks, but from what his diagrams symbolize. A further distinction is that all hypotheses and illegitimate postulates are either universal or particular, whereas a definition is neither.⁶

¹ *sc.* axioms.² Cf. note on 72^a 20.³ Cf. Plato, *Theaetetus*, 189 E ff.⁴ Omitting *ἢ* after *δόξη*.⁵ It seems easier to read *οὐδέν* for *οὐδέ* with Waitz, but one would then expect *λέγουσιν*.⁶ A *ἔπος* is not strictly a judgement at all; it is the *unity* of the constitutive moments of an *ἄτομον εἶδος* set out as a formula or *λόγος*.

II So¹ demonstration does not necessarily imply the being 5
of Forms nor a One beside a Many, but it does necessarily
imply the possibility of truly predicating one of many;
since without this possibility we cannot save the universal,
and if the universal goes, the middle term goes with it, and
so demonstration becomes impossible. We conclude, then,
that there must be a single identical term unequivocally
predicable of a number of individuals.

The law that it is impossible to affirm and deny simul- 10
taneously the same predicate of the same subject is not
expressly posited by any demonstration except when the
conclusion also has to be expressed in that form; in which
case the proof lays down as its major premiss that the
major is truly affirmed of the middle but falsely denied.
It makes no difference, however, if we add to the middle, or
again to the minor term, the corresponding negative. For
grant a minor term of which it is true to predicate man— 15
even if it be also true to predicate not-man of it—still grant
simply that man is animal and not not-animal, and the
conclusion follows: for it will still be true to say that
Callias—even if it be also true to say that not-Callias—is
animal and not not-animal.² The reason is that the major

¹ Zabarella inserts the first paragraph of this chapter down to *μη δμῶνυμον* in *9 at 75^b 30.

² i.e. if the required conclusion is 'Callias is animal and not not-animal', the syllogism is adequate in the form

Man is animal and not not-animal,
Callias is man,
∴ Callias is animal and not not-animal.

There is no need to add 'and not not-man' to the middle or 'and not not-Callias' to the minor, for even if the opposites which these additions would exclude were taken as true, the same conclusion would follow:

Man and also not-man (cat, dog, &c.) is animal and not not-animal,

Callias and also not-Callias (Plato, Socrates, &c.) is man-and-also-not-man (i.e. belongs to a genus wider than man and narrower than animal).

∴ Callias is animal and not not-animal.

The major once made definite, the width of the middle, provided it is narrower than the major, does not matter, and the width of the minor, provided it is narrower than the middle, is unimportant.

The construction in *15-17 perhaps presents two anacolutha: (a) the antecedent to *καθ' οὗ* seems to be the subject to an unexpressed verb, presumably *εἶναι* (could *εἶναι* have dropped out between *εἰπεῖν* and *εἰ*

term is predicable not only of the middle, but of something other than the middle as well, being of wider application;
 20 so that the conclusion is not affected even if the middle is extended to cover the original middle term and also what is not the original middle term.¹

The law that every predicate can be either truly affirmed or truly denied of every subject is posited by such demonstration as uses *reductio ad impossibile*, and then not always universally, but so far as it is requisite; within the limits, that is, of the genus—the genus, I mean (as I have already
 25 explained²), to which the man of science applies his demonstrations. In virtue of the common elements of demonstration—I mean the common axioms which are used as premisses of demonstration,³ not the subjects nor the attributes demonstrated as belonging to them—all the sciences have communion with one another, and in communion with them all is dialectic and any science which might attempt a universal proof of axioms such as the law of
 30 excluded middle, the law that the subtraction of equals from equals leaves equal remainders, or other axioms of the same kind. Dialectic has no definite sphere of this kind, not being confined to a single genus. Otherwise its method would not be interrogative; for the interrogative method is barred to the demonstrator, who cannot use the opposite facts to prove the same *nexus*. This was shown in my work
 35 on the syllogism.⁴

If a syllogistic question⁵ is equivalent to a proposition embodying one of the two sides of a contradiction, and if

καὶ ?), and (δ) a main clause, 'the conclusion follows', must be supplied. To avoid (α) I have with hesitation taken the antecedent to καὶ οὐ as subject to ἐδόθη in the first εἰ clause, and ἐδόθη as followed by the infinitive εἶναι in the third εἰ clause.

¹ Lit. 'even if the middle is itself and also what is not itself'; i.e. you may pass from the middle term man to include not-man without affecting the conclusion. Cf. previous note.

² Cf. 75^a 42 ff. and 76^b 13.

³ Cf. note on 75^a 42.

⁴ *An. Pr.* I. i. The 'opposite facts' are those which would be expressed in the alternatively possible answers to the dialectical question, the dialectician's aim being to refute his interlocutor whether the latter answers the question first put to him affirmatively or in the negative.

⁵ i.e. a premiss put in the form of a question.

each science has its peculiar propositions from which its peculiar conclusion is developed, then there is such a thing as a distinctively scientific question, and it is the interrogative form of the premisses from which the 'appropriate' conclusion of each science is developed. Hence it is clear 40 that not every question will be relevant to geometry, nor to medicine, nor to any other science: only those questions will be geometrical which form premisses for the proof of 77^b the theorems of geometry or of any other science,¹ such as optics, which uses the same basic truths as geometry. Of the other sciences the like is true. Of these questions the geometer is bound to give his account, using the basic truths of geometry in conjunction with his previous conclusions; of the basic truths the geometer, as such, is not 5 bound to give any account. The like is true of the other sciences. There is a limit, then, to the questions which we may put to each man of science; nor is each man of science bound to answer all inquiries on each several subject, but only such as fall within the defined field of his own science. If, then, in controversy with a geometer *qua* geometer the disputant confines himself to geometry and proves anything from geometrical premisses, he is clearly to be applauded; 10 if he goes outside these he will be at fault, and obviously cannot even refute the geometer except accidentally.² One should therefore not discuss geometry among those who are not geometers, for in such a company an unsound argument will pass unnoticed. This is correspondingly true in the other sciences. 15

Since there are 'geometrical' questions, does it follow that there are also distinctively 'ungeometrical' questions? Further, in each special science—geometry for instance—what kind of error³ is it that may vitiate questions, and yet not exclude⁴ them from that science? Again, is the erroneous conclusion one constructed from premisses opposite to

¹ Reading $\eta \delta \epsilon \kappa \tau\omega\nu$ with C and Bonitz.

² Placing a colon instead of a comma after $\delta\epsilon\iota\kappa\nu\acute{\eta}\eta$, a comma instead of a full stop after $\kappa\alpha\lambda\acute{\omega}\varsigma$ in ^b 11, and a colon instead of a comma after $\sigma\upsilon\mu\beta\epsilon\beta\eta\kappa\acute{o}\varsigma$ in ^b 12.

³ Reading $\pi\omicron\lambda\alpha\nu$.

⁴ Omitting $\eta \delta \gamma\epsilon\omega\mu\acute{\epsilon}\tau\eta\gamma\mu\alpha$ with A, B, and C. So Waitz.

20 the true premisses,¹ or is it formal fallacy though drawn from geometrical premisses?² Or, perhaps, the erroneous conclusion is due to the drawing of premisses from another science; e.g. in a geometrical controversy a musical question is distinctively ungeometrical, whereas the notion that parallels meet is in one sense geometrical, being ungeometrical in a different fashion: the reason being that 'ungeometrical', like 'unrhythmical', is equivocal, meaning in the
 25 one case not geometry at all,³ in the other bad geometry? It is this error, i. e. error⁴ based on premisses of this kind—'of' the science but false—that is the contrary⁵ of science. In mathematics the formal fallacy is not so common, because it is the middle term in which the ambiguity lies,⁶ since the major is predicated of the whole of the middle
 30 and the middle of the whole of the minor (the *predicate* of course never has the prefix 'all'); and in mathematics one can, so to speak, see these middle terms with an intellectual vision, while in dialectic the ambiguity may escape detection. E.g. 'Is every circle a figure?' A diagram shows that this is so, but the minor premiss 'Are epics circles?'⁷ is shown by the diagram to be false.

If a proof has an inductive minor premiss, one should not
 35 bring an 'objection' against it. For since every premiss must be applicable to a number of cases (otherwise it will not be true in every instance, which, since the syllogism proceeds from universals, it must be), then assuredly the same is true of an 'objection'; since premisses and 'objections' are so far the same that anything which can be validly advanced as an 'objection' must be such that it could take the form of a premiss, either demonstrative or
 40 dialectical.⁸ On the other hand, arguments formally illo-

¹ i. e. wrong in its matter.

² Placing a note of interrogation after *κατὰ γεωμετρίαν δέ*.

⁶ Reading *δεῖ τὸ διττόν* with A, B, and C first hand.

⁷ The reference is to *τὰ κυκλικά*, the cycle of post-Homeric epics supplementing Homer.

⁸ The connexion of this section 77^b 34-9 is not very clear.

gical do sometimes occur through taking as middles mere attributes of the major and minor terms. An instance of this is Caeneus' proof that fire increases in geometrical 78^a proportion: 'Fire', he argues, 'increases rapidly, and so does geometrical proportion'. There is no syllogism so, but there is a syllogism if the most rapidly increasing proportion is geometrical and the most rapidly increasing proportion is attributable to fire in its motion. Sometimes, 5 no doubt, it is impossible to reason from premisses predicating mere attributes: but sometimes it is possible, though the possibility is overlooked.¹ If false premisses could never give true conclusions 'resolution' would be easy, for premisses and conclusion would in that case inevitably reciprocate.² I might then argue thus: let A ³ be an existing fact; let the existence of A imply such and such facts actually known to me to exist, which we may call B .⁴ I can now, since they reciprocate, infer A from B .

Reciprocation of premisses and conclusion is more fre- 10 quent in mathematics, because mathematics takes definitions, but never an accident, for its premisses—a second characteristic distinguishing mathematical reasoning from dialectical disputations.

A science expands not by the interposition of fresh middle

Zabarella inserts it at the end of ch. 17. I take it as an *obiter dictum* on *ἐνστασις*, and Aristotle as saying that the proper way to attack a proof containing an inductive minor premiss is not to urge an *ἐνστασις*, for in science an *ἐνστασις*, like a positive premiss of science, must be universal and must lead to the conclusion opposite to the inference it attacks. Hence if the *ἐνστασις* is another inductive premiss, it is equally unscientific—it does not *demonstrate* an opposite conclusion; if it is universal, it is gratuitous, for all one need do, Aristotle implies, is to point out that the original 'proof' proves nothing, because it has a premiss which is not *καθόλου*.

¹ It is possible, i.e. not of course by mere conversion to the first figure, but when, as in the above hypothetical example, a fresh truth ignored in the invalid argument can be brought in to amend the paralogism and produce a syllogism in the first figure.

² Paralogism occurs because, though true premisses must give a true conclusion, the converse does not hold. If it did, premisses and conclusion would reciprocate, and it would be as easy to 'resolve' a conclusion into its premisses as to see what conclusion must follow from given premisses.

³ The premisses regarded as an antecedent.

⁴ The conclusion regarded as a consequent.

- terms, but by the apposition of fresh extreme terms.¹ E.g.
 15 A is predicated of B , B of C , C of D , and so indefinitely.
 Or the expansion may be lateral: e.g. one major, A , may
 be proved of two minors, C and E . Thus let A represent
 number—a number or *number* taken indeterminately; B
 determinate odd number; C any particular odd number.
 20 We can then predicate A of C . Next let D represent
 determinate even number, and E even number. Then A is
 predicable of E .²

Knowledge of the fact differs from knowledge of the Γ ,
 reasoned fact. To begin with, they differ within the same
 science and in two ways: (1) when the premisses of the
 25 syllogism are not immediate (for then the proximate cause
 is not contained in them—a necessary condition of know-
 ledge of the reasoned fact): (2) when the premisses are
 immediate, but instead of the cause the better known of
 the two reciprocals is taken as the middle; for of two
 reciprocally predicable terms the one which is not the cause
 may quite easily be the better known and so become the

¹ i.e. the old conclusion forms one premiss of the new syllogism
 and supplies the middle term:

$A-B$ That which has sensation, sleeps,

$B-C$ Animal has sensation;

$\therefore A-C$ Animal sleeps.

Then (1) if the apposed term is a minor,

$A-C$ Animal sleeps,

$C-D$ That which expels fatigue-products is animal;

$\therefore A-D$ That which expels fatigue-products sleeps.

(2) if the apposed term is a major,

$D-A$ That which sleeps expels fatigue-products,

$A-C$ Animal sleeps;

$\therefore D-C$ Animal expels fatigue-products.

Cf. note on *An. Pr.* 26^a 29.

Aristotle here and in the passage immediately following, where he
 speaks of lateral expansion, is thinking of the scientist as setting out
 the body of his results in systematic form, as in fact writing a text-
 book: in passages such as i, ch. 22, 85^a 1 ff. which regard the ex-
 pansion of a science as proceeding by the insertion of fresh middle
 terms between the terms of a *πρόβλημα*, he has in mind actual
 scientific discovery or at any rate a systematization of results prior
 to the final setting out of the science in its logical order.

² i.e.

$A-B$ and $A-D$ are the two major
 premisses with A for predicate which
 produce respectively the conclusions
 $A-C$ and $A-E$.

middle term of the demonstration. Thus (2) (*a*) you might prove as follows that the planets are near because they do ³⁰ not twinkle: let *C* be the planets, *B* not twinkling, *A* proximity. Then *B* is predicable of *C*; for the planets do not twinkle. But *A* is also predicable of *B*, since that which does not twinkle is near—we must take this truth as having been reached by induction or sense-perception. Therefore ³⁵ *A* is a necessary predicate of *C*; so that we have demonstrated that the planets are near. This syllogism, then, proves not the reasoned fact but only the fact; since they are not near because they do not twinkle, but, because they are near, do not twinkle. The major and middle of the proof, however, may be reversed, and then the demonstration will be of the reasoned fact. Thus: let *C* be the ⁴⁰ planets, *B* proximity, *A* not twinkling. Then *B* is an ^{78^b} attribute of *C*, and *A*—not twinkling—of *B*. Consequently *A* is predicable of *C*, and the syllogism proves the reasoned fact, since its middle term is the proximate cause. Another example is the inference that the moon is spherical from its manner of waxing. Thus: since that which so waxes is ⁵ spherical, and since the moon so waxes, clearly the moon is spherical. Put in this form, the syllogism turns out to be proof of the fact, but if the middle and major be reversed it is proof of the reasoned fact; since the moon is not spherical because it waxes in a certain manner, but waxes in such a manner because it is spherical. (Let *C* be the moon, *B* ¹⁰ spherical, and *A* waxing.) Again (*b*), in cases where the cause and the effect are not reciprocal and the effect is the better known, the fact is demonstrated but not the reasoned fact. This also occurs (1) when the middle falls outside the major and minor,¹ for here too the strict cause is not given, and so the demonstration is of the fact, not of the reasoned fact. For example, the question 'Why does ¹⁵ not a wall breathe?' might be answered, 'Because it is not an animal'; but that answer would not give the strict cause, because if not being an animal causes the absence of respiration, then being an animal should be the cause of respiration,

¹ *sc.* in the second figure (*vide* 78^b 24), in which the middle is predicate in both premisses. Cf. *An. Pr.* i, ch. 5, 26^b 39.

according to the rule that if the negation of x causes the
 20 non-inherence of y , the affirmation of x causes the inherence
 of y ; e.g. if the disproportion of the hot and cold elements is
 the cause of ill health, their proportion is the cause of health;
 and conversely, if the assertion of x causes the inherence of
 y , the negation of x must cause y 's non-inherence. But in
 the case given this consequence does not result; for not
 every animal breathes. A syllogism with this kind of cause
 takes place in the second figure. Thus: let A be animal,
 25 B respiration, C wall. Then A is predicable of all B (for
 all that breathes is animal), but of no C ; and consequently
 B is predicable of no C ; that is, the wall does not breathe.
 Such causes are like far-fetched explanations, which precisely
 consist in making the cause too remote, as in Anacharsis'
 30 account of why the Scythians have no flute-players; namely
 because they have no vines.¹

Thus, then, do the syllogism of the fact and the syllogism
 of the reasoned fact differ within one science and according
 to the position of the middle terms. But there is another
 way too in which the fact and the reasoned fact differ, and
 that is ² when they are investigated respectively by different
 35 sciences. This occurs in the case of problems related to
 one another as subordinate and superior, as when optical
 problems are subordinated to geometry, mechanical prob-
 lems to stereometry, harmonic problems to arithmetic,
 40 the data of observation to astronomy. (Some of these
 79^a sciences bear almost the same name; e.g. mathematical
 and nautical astronomy, mathematical and acoustical har-
 monics.) Here it is the business of the empirical observers
 to know the fact, of the mathematicians to know the
 reasoned fact; for the latter are in possession of the demon-
 strations giving the causes, and are often ignorant of the
 5 fact: just as we have often a clear insight into a universal,
 but through lack of observation are ignorant of some of its
 particular instances. These connexions³ have a perceptible
 existence though they are manifestations of forms. For

¹ i.e. they have no flute-players, ∴ they do not indulge in wine, ∴ they have no grapes, ∴ they have no vines.

² In 78^b 35 read τῶν δι' ἀλλῆς for τὸ δι' ἀλλῆς with n and p.

³ sc. 'which require two sciences for their proof'. Cf. 78^b 35.

the mathematical sciences concern forms: they do not demonstrate properties of a substratum, since, even though the geometrical subjects are predicable as properties of a perceptible substratum, it is not as thus predicable that the mathematician demonstrates properties of them.¹ As optics is related to geometry, so another science is related to optics, namely the theory of the rainbow. Here knowledge of the fact is within the province of the natural philosopher, knowledge of the reasoned fact within that of the optician, either *qua* optician or ² *qua* mathematical optician. Many sciences not standing in this mutual relation enter into it at points; e.g. medicine and geometry: it is the physician's business to know that circular wounds heal more slowly, the geometer's to know the reason why.³

- 14 Of all the figures the most scientific is the first. Thus, it is the vehicle of the demonstrations of all the mathematical sciences, such as arithmetic, geometry, and optics, and practically of all sciences that investigate causes: for the syllogism of the reasoned fact is either exclusively or generally speaking and in most cases in this figure—a second proof that this figure is the most scientific; for grasp of a reasoned conclusion is the primary condition of knowledge. Thirdly, the first is the only figure which enables us to pursue knowledge of the essence of a thing. In the second figure no affirmative conclusion is possible, and knowledge of a thing's essence must be affirmative; while in the third figure the conclusion can be affirmative, but cannot be universal, and essence must have a universal character: e.g. man is not two-footed animal in any qualified sense, but universally. Finally, the first figure has no need of the others, while it is by means of the first that the other two figures are developed, and have their intervals

¹ Cf. 81^b 2-5 and note thereon.

² Reading η $\tau\omicron\upsilon$ $\kappa\alpha\tau\grave{\alpha}$ for η $\kappa\alpha\tau\grave{\alpha}$ in 79^a 12, with the MSS. Bekker's omission of $\tau\omicron\upsilon$ is an obvious misprint.

³ Perhaps because they expose the maximum amount of raw surface, or possibly because a wound forming an acute angle heals most easily—i.e. by first or second intention χ granulation—and therefore a circular wound least easily.

close-packed¹ until immediate premisses are reached. Clearly, therefore, the first figure is the primary condition of knowledge.

Just as an attribute *A* may (as we saw) be atomically 15 connected with a subject *B*, so its disconnexion may be atomic. I call 'atomic' connexions or disconnexions which 35 involve no intermediate term; since in that case the connexion or disconnexion will not be mediated by something other than the terms themselves. It follows that if either *A* or *B*, or both *A* and *B*, have a genus, their disconnexion cannot be primary. Thus: let *C* be the genus of *A*. Then, if *C* is not the genus of *B*—for *A* may well have a genus 40 which is not the genus of *B*—there will be a syllogism proving *A*'s disconnexion from *B* thus:

79^b

all *A* is *C*,
no *B* is *C*,
∴ no *B* is *A*.

Or if it is *B* which has a genus *D*, we have

all *B* is *D*,
no *D* is *A*,
∴ no *B* is *A*, by syllogism;

5 and the proof will be similar if both *A* and *B* have a genus. That the genus of *A* need not be the genus of *B* and vice versa, is shown by the existence of mutually exclusive co-ordinate series of predication. If no term in the series *ACD* . . . is predicable of any term in the series *BEF* . . ., and if *G*—a term in the former series—is the genus of *A*, 10 clearly *G* will not be the genus of *B*; since, if it were, the series would not be mutually exclusive. So also if *B* has a genus, it will not be the genus of *A*. If, on the other hand, neither *A* nor *B* has a genus and *A* does not inhere in *B*, this disconnexion must be atomic. If there be a middle term, one or other of them is bound to have

¹ Cf. i, ch. 23, 84^b 19 ff., and also note on 78^a 14. *πύκνωσις* means the filling up with middle terms of the mediable loosely connected διάστημα or interval between the terms of a πρόβλημα or proposition requiring proof—a process which continues until each term is immediately connected with its neighbour, and basic premisses are reached. Then only is the original πρόβλημα genuinely proved.

a genus, for the syllogism will be either in the first or the 15
second figure. If it is in the first, *B* will have a genus—for
the premiss containing it must be affirmative;¹ if in the
second, either *A* or *B* indifferently, since syllogism is pos-
sible if either is contained in a negative premiss,² but not if
both premisses are negative. 20

Hence it is clear that one thing may be atomically
disconnected from another,³ and we have stated when and
how this is possible.

16 Ignorance—defined not as the negation of knowledge but
as a positive state of mind—is error produced by inference.

(1) Let us first consider propositions asserting a predicate's 25
immediate connexion with or disconnexion from a subject.
Here,⁴ it is true, positive error may befall one in alternative
ways; for it may arise where one directly believes a con-
nexion or disconnexion as well as where one's belief is
acquired by inference. The error, however, that consists
in a direct belief is without complication; but the error
resulting from inference—which here concerns us—takes
many forms. Thus, let *A* be atomically disconnected from
all *B*: then the conclusion inferred through a middle term 30
C, that all *B* is *A*, will be a case of error produced by
syllogism. Now, two cases are possible. Either (*a*) both
premisses, or (*b*) one premiss only, may be false. (*a*) If
neither *A* is an attribute of any *C* nor *C* of any *B*, whereas
the contrary was posited in both cases, both premisses will
be false. (*C* may quite well be so related to *A* and *B* that 35
C is neither subordinate to *A* nor a universal attribute
of *B*: for *B*, since *A* was said to be primarily disconnected
from *B*, cannot have a genus, and *A* need not necessarily
be a universal attribute of all things. Consequently both

¹ i.e. in Celarent.

² i.e. in Cesare or Camestres.

³ Reading *ἄλλο ἄλλῳ* with MSS. and Waitz. The omission of *ἄλλο* in Bekker is clearly a misprint.

⁴ *μὲν* in ^b 25 is not answered till 81^a 38. It has seemed necessary to expand the translation of ^b 25–39. ^b 26 appears to contradict ^b 24; but really Aristotle begins to discuss error resulting from inference and is led by the mention of immediate propositions to comment in passing upon error in direct apprehension.

40 premisses may be false.¹) On the other hand, (b) one of the
 premisses may be true, though not either indifferently but
 80^a only the major $A-C$; since, B having no genus, the premiss
 $C-B$ will always be false, while $A-C$ may be true. This is
 the case if, for example, A is related atomically to both C
 and B ; because when the same term is related atomically
 to more terms than one, neither of those terms will belong
 to the other.² It is, of course, equally the case if $A-C$ is
 5 not atomic.³

Error of attribution, then, occurs through these causes
 and in this form only—for we found that no syllogism
 of universal attribution was possible in any figure but the
 first.⁴ On the other hand, an error of non-attribution may
 occur either in the first or in the second figure. Let us
 therefore first explain the various forms it takes in the first
 10 figure and the character of the premisses in each case.

(c) It may occur when both premisses are false; e.g.
 supposing A atomically connected with both C and B ,

¹ e.g. $\begin{array}{cc} C & A \\ \text{All quantity is substance,} & \\ B & C \\ \text{All quality is quantity; } & \\ B & A \end{array}$
 \therefore All quality is substance.

Had B a genus, A 's disconnexion from B would have been mediated
 by it.

² e.g. $\begin{array}{cc} C & A \\ \text{All body is substance—atomic,} & \\ B & C \\ \text{All quality is body; } & \\ B & A \end{array}$
 \therefore All quality is substance—atomic.

The reference cannot be to the impossibility of predicating co-ordinate
 species of one another, because B is stated to have no genus. We
 must therefore suppose *κατηγορεῖν* here to include negation as well as
 affirmation (cf. 82^a 14 and note); e.g. substance is primarily affirmed
 of body and denied of quality, therefore quality and body cannot be
 predicated either of the other. Aristotle then adds that this is only
 one case, and that as long as the minor premiss is atomic the major
 need not be atomic; e.g. in the above example man or stone might
 be substituted for body.

³ e.g. $\begin{array}{cc} C & A \\ \text{All man is substance—mediable,} & \\ B & C \\ \text{All quality is man; } & \\ B & A \end{array}$
 \therefore All quality is substance—atomic.

An. Pr. i. 1.

if it be then assumed that no *C* is *A*, and all *B* is *C*, both premisses are false.¹

(*d*) It is also possible when one is false. This may be either premiss indifferently. *A*—*C* may be true, *C*—*B* false;¹⁵ —*A*—*C* true because *A* is not an attribute of all things, *C*—*B* false because *C*, which never has the attribute *A*, cannot be an attribute of *B*;² for if *C*—*B* were true, the premiss *A*—*C* would no longer be true, and besides if both premisses were true, the conclusion would be true.³ ²⁰ Or again, *C*—*B* may be true and *A*—*C* false; e.g. if both *C* and *A* contain *B* as genera, one of them must be subordinate to the other, so that if the premiss takes the form No *C* is *A*, it will be false.⁴ This makes it clear that whether either or both premisses are false, the conclusion will equally be ²⁵ false.

In the second figure the premisses cannot both be wholly false; for if all *B* is *A*, no middle term can be with truth universally affirmed of one extreme and universally denied of the other: but premisses in which the middle is affirmed ³⁰ of one extreme and denied of the other are the necessary condition if one is to get a valid inference at all.⁵ There-

¹ e.g. $\begin{array}{cc} C & A \\ \text{No cat is animal,} & \\ B & C \\ \text{All man is cat;} & \\ B & A \\ \therefore \text{No man is animal.} & \end{array}$

² Reading ἀδύνατον ὑπάρχειν with codd.

³ e.g. $\begin{array}{cc} C & A \\ \text{No stone is animal,} & \text{(possibly true } \because \text{ animal is not true of} \\ B & C \text{ all things, as is, e.g., being or one.)} \\ \text{All man is stone;} & \text{(false } \because \text{ stone, which is never animal,} \\ B & A \text{ cannot be an attribute of man.)} \\ \therefore \text{No man is animal.} & \end{array}$

⁴ e.g. $\begin{array}{cc} C & A \\ \text{No living thing is animal,} & \\ B & C \\ \text{All man is living;} & \\ B & A \\ \therefore \text{No man is animal.} & \end{array}$

Here 'living' must be a genus of animal because both animal and living are predicable of man as genera. If living and animal were co-ordinate, they could not both be predicable of man.

⁵ *sc.* in this figure.

fore if, taken in this way, they are wholly false, their contraries conversely should be wholly true. But this is impossible.¹ On the other hand, there is nothing to prevent both premisses being partially false; e.g. if actually
 35 some *A* is *C* and some *B* is *C*, then if it is premised that all *A* is *C* and no *B* is *C*, both premisses are false, yet partially, not wholly, false.² The same is true if the major is made negative instead of the minor. Or one premiss may be wholly false, and it may be either of them. Thus, supposing that actually an attribute of all *A* must also be an
 40 attribute of all *B*,³ then if *C* is yet taken to be a universal
 80^b attribute of all *A* but universally non-attributable to *B*, *C-A* will be true but *C-B* false.⁴ Again, actually that which is an attribute of no *B* will not be an attribute of all *A* either; for if it be an attribute of all *A*, it will also be an attribute of all *B*, which is contrary to supposition; but if *C* be nevertheless assumed to be a universal attribute of
 5 *A*, but an attribute of no *B*, then the premiss *C-B* is true

¹ e.g. in Camestres, $\begin{array}{cc} A & C \\ B & C \end{array}$
 All animal is immortal,
 No man is immortal,

gives the false conclusion No man is animal: but if the contraries of these premisses were wholly true they would form a syllogism in Cesare—

$\begin{array}{cc} A & C \\ B & C \end{array}$
 No animal is immortal,
 All men are immortal—

giving the same conclusion—No man is animal—which would have to be true.

² e.g. $\begin{array}{cc} A & C \\ B & C \end{array}$
 All animals are biped,
 No mammals are biped;
 $\begin{array}{cc} B & A \end{array}$
 \therefore No mammals are animal.

³ *sc.* as must be the case on our initial assumption that in fact all *B* is *A*.

⁴ e.g. $\begin{array}{cc} A & C \\ B & C \end{array}$
 All animal is living,
 No man is living;
 $\begin{array}{cc} B & A \end{array}$
 \therefore No man is animal.

but the major is false.¹ The case is similar if the major is made the negative premiss. For in fact what is an attribute of no *A* will not be an attribute of any *B* either; and if it be yet assumed that *C* is universally non-attributable to *A*, but a universal attribute of *B*, the premiss *C-A* is true but the minor wholly false.² Again, in fact it is 10 false to assume that that which is an attribute of all *B* is an attribute of no *A*, for if it be an attribute of all *B*, it must be an attribute of some *A*. If then *C* is nevertheless assumed to be an attribute of all *B* but of no *A*, *C-B* will be true but *C-A* false.³

It is thus clear that in the case of atomic propositions erroneous inference will be possible not only when both 15 premisses are false but also when only one is false.

- 17 (2) In the case of attributes not atomically connected with or disconnected from their subjects, (a) (i) as long as the false conclusion is inferred through the 'appropriate' middle, only the major and not both premisses can be false. By 20 'appropriate middle' I mean the middle term through which the contradictory—i.e. the true—conclusion is inferrible.⁴ Thus, let *A* be attributable to *B* through a middle term *C*: then, since to produce a conclusion the premiss *C-B* must be taken affirmatively, it is clear that this premiss must

¹ e.g. *A* *C*
All animal is stone,
 B *C*
No man is stone;
 B *A*
∴ No man is animal.

² e.g. *A* *C*
No animal is stone,
 B *C*
All man is stone;
 B *A*
∴ No man is animal.

³ e.g. *A* *C*
No animal is living,
 B *C*
All man is living;
 B *A*
∴ No man is animal.

⁴ Cf. note on 71^b 3. This definition is a corollary of the definition there given of 'appropriate'.

25 always be true, for its quality is not changed.¹ But the major $A-C$ is false, for it is by a change in the quality of $A-C$ that the conclusion becomes its contradictory—i. e. true.² Similarly (ii) if the middle is taken from another series of predication; e. g. suppose D to be not only contained within A as a part within its whole but also predicable of all B . Then the premiss $D-B$ must remain unchanged, but
 30 the quality of $A-D$ must be changed; so that $D-B$ is always true, $A-D$ always false.³ Such error is practically identical with that which is inferred through the 'appropriate' middle. On the other hand, (*b*) if the conclusion is not inferred through the 'appropriate' middle—(i) when the middle is subordinate to A but is predicable of no B , both premisses
 35 must be false, because if there is to be a conclusion both must be posited as asserting the contrary of what is actually the fact, and so posited both become false: e. g. suppose that actually all D is A but no B is D ; then if these premisses are changed in quality, a conclusion will follow and both
 40 of the new premisses will be false.⁴ When, however, (ii) 81^a the middle D is not subordinate to A , $A-D$ will be true, $D-B$ false— $A-D$ true because A was not subordinate

¹ i. e. it does not become negative instead of affirmative in the false syllogism.

² e. g. $\begin{array}{cc} C & A \\ \text{Nothing rational laughs,} & \\ B & C \\ \text{All man is rational;} & \\ B & A \\ \therefore \text{No man laughs.} & \end{array}$

Change the quality of the minor and there is no inference; change the quality of the major and the contradictory and true conclusion follows.

³ e. g. $\begin{array}{cc} D & A \\ \text{Nothing that walks upright laughs,} & \\ B & D \\ \text{All men walk upright;} & \\ B & A \\ \therefore \text{No man laughs.} & \end{array}$

Change the quality of the minor and there is no inference; change the quality of the major and the contradictory—true—conclusion follows.

⁴ e. g. $\begin{array}{cc} D & A \\ \text{No brute is living,} & \\ B & D \\ \text{All men are brutes;} & \\ B & A \\ \therefore \text{No man is living.} & \end{array}$

to D , $D-B$ false because if it had been true, the conclusion too would have been true; but it is *ex hypothesi* false.¹

When the erroneous inference is in the second figure, both 5 premisses cannot be entirely false; since if B is subordinate to A , there can be no middle predicable of all of one extreme and of none of the other, as was stated before.² One premiss, however, may be false, and it may be either of them. Thus, if C is actually an attribute of both A and B , but is assumed 10 to be an attribute of A only and not of B , $C-A$ will be true, $C-B$ false:³ or again if C be assumed to be attributable to B but to no A , $C-B$ will be true, $C-A$ false.

We have stated when and through what kinds of premisses 15 error will result in cases where the erroneous conclusion is negative. If the conclusion is affirmative, (a) (i) it may be inferred through the 'appropriate' middle term. In this case both premisses cannot be false since, as we said before,⁴ $C-B$ must remain unchanged if there is to be a conclusion, and consequently $A-C$, the quality of which is changed, will always be false. This is equally true if (ii) the middle 20 is taken from another series of predication, as was stated to be the case also with regard to negative error;⁵ for $D-B$ must remain unchanged, while the quality of $A-D$ must be converted, and the type of error is the same as before.

(b) The middle may be inappropriate. Then (i) if D is 25 subordinate to A , $A-D$ will be true, but $D-B$ false; since A may quite well be predicable of several terms no one of

¹ e.g. $\begin{array}{cc} D & A \\ \text{No stone is living,} & \\ B & D \\ \text{All man is stone;} & \\ B & A \\ \therefore \text{No man is living.} & \end{array}$

² Cf. 80^a 29.

³ e.g. $\begin{array}{cc} A & C \\ \text{Every living thing is substance,} & \\ B & C \\ \text{No man is substance;} & \\ B & A \\ \therefore \text{No man is living.} & \end{array}$

⁴ Cf. 80^b 17-26.

⁵ Cf. 80^b 26-32.

which can be subordinated to another.¹ If, however, (ii) *D* is not subordinate to *A*, obviously *A-D*, since it is affirmed, will always be false, while *D-B*² may be either true or
 30 false; for *A* may very well be an attribute of no *D*, whereas all *B* is *D*, e. g. no science is animal, all music is science. Equally well *A* may be an attribute of no *D*, and *D* of no *B*. It emerges, then, that if the middle term is not subordinate to the major, not only both premisses but either singly may be false.

35 Thus we have made it clear how many varieties of erroneous inference are liable to happen and through what kinds of premisses they occur, in the case both of immediate and of demonstrable truths.

It is also clear that the loss of any one of the senses entails 18 the loss of a corresponding portion of knowledge, and that, since we learn either by induction or by demonstration, this
 40 knowledge cannot be acquired. Thus demonstration develops from universals, induction from particulars; but since it is possible to familiarize the pupil with even the so-called mathematical abstractions only through induction—i. e. only because each subject genus possesses, in virtue of a determinate mathematical character, certain properties which can be treated as separate even though they do not exist in
 5 isolation³—it is consequently impossible to come to grasp universals except through induction. But induction is impossible for those who have not sense-perception. For it is sense-perception alone which is adequate for grasping the particulars: they cannot be objects of scientific knowledge, because neither can universals give us knowledge of

| | | |
|--------------------|----------------------------|----------|
| | <i>D</i> | <i>A</i> |
| ¹ e. g. | All brutes are quadrupeds, | |
| | <i>B</i> | <i>D</i> |
| | All men are brutes; | |
| | <i>B</i> | <i>A</i> |
| | ∴ All men are quadrupeds. | |

² Reading τὴν δὲ ΔΒ with MSS.

³ Cf. 79^b 6-10. Τὰ μαθηματικά or τὰ ἐξ ἀφαιρέσεως, as Aristotle calls them, exist only as properties of sensible objects, not *per se* as separate entities, although they can be isolated by abstraction and thus constitute the subjects of mathematical demonstration. Consequently it is only by ἐπαγωγή from sensible objects that the universal can be elicited and known: vide *Met. K.* 1061^a 28.

them without induction, nor can we get it through induction without sense-perception.¹

- 19 Every syllogism is effected by means of three terms. 10
One kind of syllogism serves to prove that *A* inheres in *C* by showing that *A* inheres in *B* and *B* in *C*; the other is negative and one of its premisses asserts one term of another, while the other denies one term of another. It is clear, then, that these are the fundamentals and so-called hypotheses of syllogism. Assume them as they have been stated, and 15 proof is bound to follow—proof that *A* inheres in *C* through *B*, and again that *A* inheres in *B* through some other middle term, and similarly that *B* inheres in *C*. If our reasoning aims at gaining credence and so is merely dialectical, it is obvious that we have only to see that our inference is based on premisses as credible as possible: so that if a middle 20 term between *A* and *B* is credible though not real, one can reason through it and complete a dialectical syllogism. If, however, one is aiming at truth, one must be guided by the real connexions of subjects and attributes. Thus:² since there are attributes which are predicated of a subject essentially or naturally³ and not coincidentally⁴—not, that is, 25 in the sense in which we say ‘That white (thing) is a man’, which is not the same mode of predication as when we say ‘The man is white’: the man is white not because he is something else but because he is man, but the white is man because ‘being white’ coincides with ‘humanity’ within one substratum—therefore there are terms such as are naturally subjects of predicates. Suppose, then, *C* such a term not 30 itself attributable to anything else as to a subject, but the proximate⁵ subject of the attribute *B*—i. e. so that *B*—*C* is immediate; suppose further *E* related immediately to *F*, and *F* to *B*. The first question is, must this series terminate,

¹ *vide* ii, ch. 19 and notes thereon.

² Placing a colon after οὕτως.

³ i. e. predication in which the predicate is essentially adjectival; cf. ch. 4, 73^b 5–10. Such predication is called by the Latin commentators ‘predicatio naturalis’, and is further discussed in ch. 22.

⁴ Cf. note on 73^b 4.

⁵ In ch. 21, 82^a 39 ff. Aristotle from the alternative point of view defines such a subject as ὑποκείμενον.

or can it proceed to infinity? The second question is as follows: Suppose nothing is essentially predicated of *A*, but
 35 *A* is predicated primarily of *H* and of no intermediate prior term, and suppose *H* similarly related to *G* and *G* to *B*; then must this series also terminate, or can it too proceed to infinity? There is this much difference between the questions: the first is, is it possible to start from that which is not itself attributable to anything else but is the subject
 40 of attributes, and ascend to infinity? The second is the problem whether one can start from that which is a predicate
 82^a but not itself a subject of predicates, and descend to infinity? A third question is, if the extreme terms are fixed, can there be an infinity of middles? I mean this: suppose for example that *A* inheres in *C* and *B* is intermediate between them, but
 5 between *B* and *A* there are other middles, and between these again fresh middles; can these proceed to infinity or can they not? This is the equivalent of inquiring, do demonstrations proceed to infinity, i.e. is everything demonstrable? Or do ultimate subject and primary attribute limit one another?

I hold that the same questions arise with regard to
 10 negative conclusions and premisses: viz. if *A* is attributable to no *B*, then either this predication will be primary, or there will be an intermediate term prior to *B* to which *A* is not attributable—*G*, let us say, which is attributable to all *B*—and there may still be another term *H* prior to *G*, which is attributable to all *G*. The same questions arise, I say, because in these cases too either the series of prior terms to which *A* is not attributable¹ is infinite or it terminates.

15 One cannot ask the same questions in the case of reciprocating terms, since when subject and predicate are convertible² there is neither primary nor ultimate subject, seeing that all the reciprocals *qua* subjects stand in the same relation to one another, whether we say that the subject has an infinity of attributes or that both subjects and attributes—and we raised the question in both cases—are infinite in

¹ Reading *οὐχ ὑπάρχει* with D: or else *ὑπάρχειν* is used generally to include negation.

² Reading *ἀντικατηγορουμένοις* with D. So Waitz.

number. These questions then cannot be asked—unless, indeed, the terms can reciprocate by two different modes, by accidental predication in one relation and natural 20 predication in the other.¹

- 20 Now,² it is clear that if the predications terminate in both the upward and the downward direction (by 'upward' I mean the ascent to the more universal, by 'downward' the descent to the more particular), the middle terms cannot be infinite in number. For suppose that *A* is predicated of *F*, and that the intermediates—call them *BB'B"*. . .—are 25 infinite, then clearly you might descend from *A* and find one term predicated of another *ad infinitum*, since you have an infinity of terms between you and *F*; and equally, if you ascend from *F*, there are infinite terms between you and *A*. It follows that if these processes are impossible there cannot be an infinity of intermediates between *A* and *F*. Nor is it of any effect to urge that some terms of the 30 series *AB. . . F*³ are contiguous⁴ so as to exclude intermediates, while others cannot be taken into the argument at all:⁵ whichever terms of the series *B . . .* I take, the number of intermediates in the direction either of *A* or of *F* must be finite or infinite: where the infinite series starts, whether from the first term or from a later one, is of no moment, for the succeeding terms in any case are infinite 35 in number.

- 21 Further,⁶ if in affirmative demonstration the series terminates in both directions, clearly it will terminate too

¹ The possibility of 'unnatural' predication is ruled out in ch. 22.

² Ch. 20 consists of a hypothetical argument to the effect that if the first and second questions asked in ch. 19 are answered in the negative, then the answer to the third question must also be in the negative.

³ I read *ABZ* with Waitz. Codd. *ABC* read *ABT*, not, as Bekker indicates, *AB*; cod. *M*, *AB*.

⁴ Cf. note on 95^b 4.

⁵ The objector apparently argues that even if *in fact* the number of terms between *A* and *F* is infinite, yet *in thought* we can reach from *A* to *F* since some of the intermediate terms will be contiguous and the rest—the possibly infinite series of middles separating two terms—may elude our apprehension altogether, so that for our thought these two terms constitute an immediate proposition.

⁶ The hypothetical argument of the last chapter is now extended to cover negation.

in negative demonstration. Let us assume that we cannot proceed to infinity either by ascending from the ultimate term (by 'ultimate term' I mean a term such as *F* was, 82^b not itself attributable to a subject but itself the subject of attributes), or by descending towards an ultimate from the primary term (by 'primary term' I mean a term predicable of a subject but not itself a subject¹). If this assumption is justified, the series will also terminate in the case of negation. For a negative conclusion can be proved in all 5 three figures. In the first figure it is proved thus: no *B* is *A*, all *C* is *B*. In packing the interval *B*–*C* we must reach immediate propositions—as is always the case with the minor premiss²—since *B*–*C* is affirmative. As regards the other premiss it is plain that if the major term is denied of a term *D* prior to *B*, *D* will have to be predicable of all *B*, 10 and if the major is denied of yet another term prior to *D*, this term must be predicable of all *D*. Consequently, since the ascending series is finite, the descent will also terminate and there will be a subject of which *A* is primarily non-predicable.³ In the second figure the syllogism is, all *A* is *B*, no *C* is *B*, ∴ no *C* is *A*. If proof of this⁴ is required, 15 plainly it may be shown either in the first figure as above, in the second as here, or in the third. The first figure has been discussed, and we will proceed to display the second, proof by which will be as follows: all *B* is *D*, no *C* is *D* . . ., since it is required that *B* should be a subject of which a predicate is affirmed. Next, since *D* is to be proved not to belong to *C*, then *D* has a further predicate which is denied of *C*. 20 Therefore, since the succession of predicates affirmed of an

¹ sc. a predicate above which is no wider universal.

² Because Celarent is the only mood of the first figure in which negative *ἀπόδειξις* is possible.

³ Interchanging *καίτω* and *ἄνω* in 82^b 11 and 12 with Waitz. If we keep the text, *ἡ ἐπὶ τὸ καίτω ὁδὸς* must mean the series of subjects descending from the primary, i.e. most universal predicate of *C*, through *B*, to *C*; and in that case Aristotle's argument is: 'The minor premiss, *B*–*C*, being affirmative, the number of *B*'s—and ∴ of *C*'s—predicates is finite; but it is this series which must contain the subject of which *A* is primarily denied: therefore looking at the series from the opposite point of view as ascending towards the term of which *A* is primarily denied (*ἡ ἄνω ὁδὸς*), it is equally finite.' So Zabarella; but this interpretation is artificial, and 82^b 21 below confirms Waitz's reading.

⁴ sc. 'that no *C* is *B*'.

and an infinite series cannot be traversed, predicates constituting a thing's essential nature must be finite in number.¹ But as regards predicates generally we have the following prefatory remarks to make. (1) We can affirm without falsehood 'the white (thing) is walking', and 'that big (thing) is a log'; or again, 'the log is big', and 'the man walks'. But the affirmation differs in the two cases. 5 When I affirm 'the white is a log', I mean that something which happens to be white is a log—not that white is the substratum in which log inheres, for it was not *qua* white or *qua* a species of white that the white (thing) came to be a log, and the white (thing) is consequently not a log except incidentally. On the other hand, when I affirm 'the log is white', I do not mean that something else, which happens 10 also to be a log, is white (as I should if I said 'the musician is white', which would mean 'the man who happens also to be a musician is white'); on the contrary, log is here the substratum—the substratum which actually came to be white, and did so *qua* wood or *qua* a species of wood and *qua* nothing else.

If we must lay down a rule, let us entitle the latter kind 15 of statement predication, and the former not predication at all, or not strict but accidental predication. 'White' and 'log' will thus serve as types respectively of predicate and subject.

We shall assume, then, that the predicate is invariably 20 predicated strictly and not accidentally of the subject, for on such predication demonstrations depend for their force. It follows from this that when a single attribute is predicated of a single subject, the predicate must affirm of the subject either some element constituting its essential nature, or that it is in some way qualified, quantified, essentially related, active, passive, placed, or dated.²

¹ If the attributes in a series of predication such as we are discussing are substantial, they must be finite in number, because they are then the elements constituting the definition of a substance.

² The first of three statements preliminary to a proof that predicates which are accidental—other than substantial—cannot be unlimited in number: Accidental is to be distinguished from essential or natural predication [cf. i, ch. 4, 73^b 5 ff. and *An. Pr.* i, ch. 25, 43^a 25–6]. The former is alien to demonstration: hence, provided that a single attribute is

(2) Predicates which signify substance signify that the subject is identical with the predicate or with a species of the predicate. Predicates not signifying substance which are predicated 25 of a subject not identical with themselves or with a species of themselves are accidental or coincidental; e.g. white is a coincident of man, seeing that man is not identical with white or a species of white, but rather with animal, since man 30 is identical with a species of animal. These predicates which do not signify substance must be predicates of some other subject, and nothing can be white which is not also other than white. The Forms we can dispense with, for they are mere sound without sense; and even if there are such things, they are not relevant to our discussion, since demonstrations are concerned with predicates such as we have defined.¹ 35

(3) If *A* is a quality of *B*, *B* cannot be a quality of *A*—a quality of a quality. Therefore *A* and *B* cannot be predicated reciprocally of one another in strict predication: they can be affirmed without falsehood of one another, but not genuinely predicated of each other.² For one alternative is that they should be substantially predicated of one another, i.e. *B* would become the genus or differentia of *A*—the 83^b predicate now become subject. But it has been shown that in these substantial predications neither the ascending predicates nor the descending subjects form an infinite series; e.g. neither the series, man is biped, biped is animal, &c., nor the series predicating animal of man, man of Callias, Callias of a further subject as an element of its predicated of a single subject, all genuine predicates fall either under the category of substance or under one of the adjectival categories

¹ Second preliminary statement: The precise distinction of substantive from adjectival predication makes clear (implicitly) the two distinctions, (a) that between natural and accidental predication, (b) that between substantival and adjectival predication, which falls within natural predication. [For 'coincidental', 'coincident', see note on 73^b 4.] This enables us to reject the Platonic Forms.

[In * 30 read ζῷον τι, and for περιεσφαιρα in * 33 cf. *Probl.* 918^a 29.]

² Third preliminary statement merging into the beginning of the proof proper: Reciprocal predication cannot produce an indefinite regress because it is not natural predication.

[ποιότης in 83^a 37 seems to be equivalent to 'character' and to cover all the categories, cf. *Met. Δ.* 1020^a 33^b 2. οὐτως in * 38 is most naturally taken as meaning 'in strict or natural predication', but may mean 'so as to produce an indefinite regress'. The latter is, however, an implicit consequence of the predication being unnatural.]

5 essential nature, is infinite. For all such substance is definable, and an infinite series cannot be traversed in thought: consequently neither the ascent nor the descent is infinite, since a substance whose predicates were infinite would not be definable. Hence they will not be predicated each as the genus of the other; for this would equate a
 10 genus with one of its own species. Nor (the other alternative) can a *quale* be reciprocally predicated of a *quale*, nor any term belonging to an adjectival category of another such term, except by accidental predication; for all such predicates are coincidents and are predicated of substances.¹ On the other hand—in proof of the impossibility of an infinite ascending series—every predication displays the subject as somehow qualified or quantified or as characterized under one of the other adjectival categories, or else
 15 is an element in its substantial nature: these latter are limited in number, and the number of the widest kinds under which predications fall is also limited, for every predication must exhibit its subject as somehow qualified, quantified, essentially related, acting or suffering, or in some place or at some time.²

I assume first that predication implies a single subject and a single attribute, and secondly that predicates which are not substantial are not predicated of one another. We assume this because such predicates are all coincidents, and

¹ Expansion of third preliminary statement: Reciprocals *A* and *B* might be predicated of one another (*α*) substantially; but it has been proved already that because a definition cannot contain an infinity of elements substantial predication cannot generate infinity; and it would disturb the relation of genus and species: (*β*) as *qualia* or *quanta* &c.; but this would be unnatural predication, because all such predicates are adjectival, i. e. accidents, or coincidents, of substances.

[οὐδὲ μὲν in 83^b 10, though an anacoluthon, answers ἡ . . . τοι in * 39. πάντα γὰρ . . . κατηγορεῖται in ^b 11 and 12 seems to be Aristotle's proof that the descending series in the predication of accidents terminates; sc. because it ends in an individual substance.]

² The ascent of predicates is also finite; because all predicates fall under one or other of the categories, and (*α*) the series of predicates under each category terminates when the category is reached, and (*β*) the number of the categories is limited. [(*α*) seems to mean that an attribute as well as a substance is definable by genus and differentia, and the elements in its definition must terminate in an upward direction at the category, and can therefore no more form an infinite series than can the elements constituting the definition of a substance.]

though some are essential coincidents, others of a different type, yet we maintain that all of them alike are predicated ²⁰ of some substratum and that a coincident is never a substratum—since we do not class as a coincident anything which does not owe its designation to its being something other than itself, but always hold that any coincident is predicated of some substratum other than itself, and that another group of coincidents may have a different substratum. Subject to these assumptions then, neither the ascending nor the descending series of predication in which ²⁵ a single attribute is predicated of a single subject is infinite.¹ For the subjects of which coincidents are predicated are as many as the constitutive elements of each individual substance, and these we have seen are not infinite in number, while in the ascending series are contained those constitutive elements with their coincidents—both of which are finite.² We conclude that there is a given subject $\langle D \rangle$ of which some attribute $\langle C \rangle$ is primarily predicable; that there must be an attribute $\langle B \rangle$ primarily predicable of the first attribute, and that the series must end with a term $\langle A \rangle$ not predicable of any term prior to the last ³⁰ subject of which it was predicated $\langle B \rangle$, and of which no term prior to it is predicable.³

¹ To reinforce this brief proof that descent and ascent are both finite we may repeat the premisses on which it depends. These are (1) the assumption that predication means the predication of one attribute of one subject, and (2) our proof that accidents cannot be reciprocally predicated of one another, because that would be unnatural predication. It follows from these premisses that both ascent and descent are finite. [Actually (2) only reinforces the proof that the *descent* terminates.]

² To repeat again the proof that both ascent and descent are finite: The subjects cannot be more in number than the constituents of a definable form, and these, we know, are not infinite in number; hence the descent is finite. The series regarded as an ascent contains subjects and ever more universal accidents, and neither subjects nor accidents are infinite in number.

³ Formal restatement of the last conclusion. [This is obscure: apparently Aristotle here contemplates a hybrid series: category, accident, further specified accident . . . substantial genus, subgenus . . . *infima species*, individual substance.]

If this interpretation of the first portion of the chapter is at all correct, Aristotle's first proof that the first two questions of ch. 19 must be answered in the negative is roughly as follows. The ultimate subject of all judgement is an individual substance, a concrete singular. Of such concrete singulars you can predicate substantially only the elements

The argument we have given is one of the so-called proofs; an alternative proof follows. Predicates so related to their subjects that there are other predicates prior to them predicable of those subjects are demonstrable; but of demonstrable propositions one cannot have something
 35 better than knowledge, nor can one know them without demonstration. Secondly, if a consequent is only known through an antecedent (viz. premisses prior to it) and we neither know this antecedent nor have something better than knowledge of it, then we shall not have scientific knowledge of the consequent. Therefore, if it is possible through demonstration to know anything without qualification and not merely as dependent on the acceptance of certain premisses—i. e. hypothetically—the series of intermediate
 84^a predications must terminate. If it does not terminate, and beyond any predicate taken as higher than another there remains another still higher, then every predicate is demonstrable. Consequently, since these demonstrable predicates are infinite in number and therefore cannot be traversed, we shall *not* know them by demonstration. If, therefore, we have not something better than knowledge of
 5 them, we cannot through demonstration have unqualified but only hypothetical science of anything.¹

constituting their *infima species*. These are limited in number because they form an intelligible synthesis. So far, then, as substantial predicates are concerned, the questions are answered. But these elements are also the subjects of which accidents, or coincidents, are predicated, and therefore as regards accidental predicates, at any rate, the descending series of subjects terminates. The ascending series of attributes also terminates, (1) because each higher attribute in the series can only be a higher genus of the accident predicated of the ultimate subject of its genus, and therefore an element in the accident's definition; (2) because the number of the categories is limited.

We may note that the first argument seems to envisage a series which, viewed as an ascent, starts with a concrete individual of which the elements of its definition are predicated successively, specific differentia being followed by proximate genus, which latter is the starting-point of a succession of ever more universal attributes terminating in a category; and that the second argument extends the scope of the dispute to the sum total of all the trains of accidental predication which one concrete singular substance can beget. It is, as so often in Aristotle, difficult to be sure whether he is regarding the *infima species* or the concrete singular—the *πρώτη οὐσία* of the *Categories*—as the ultimate subject of judgement. I have assumed that he means the latter.]

¹ The former proof was dialectical. So is that which follows in this paragraph. If a predicate inheres in a subject but is sub-

As dialectical proofs of our contention these may carry conviction, but an analytic process will show more briefly that neither the ascent nor the descent of predication can be infinite in the demonstrative sciences which are the ¹⁰ object of our investigation. Demonstration proves the inherence of essential attributes in things. Now attributes may be essential for two reasons: either because they are elements in the essential nature of their subjects, or because their subjects are elements in their essential nature. An example of the latter is odd as an attribute of number—though it is number's attribute, yet number itself is an ¹⁵ element in the definition of odd; of the former, multiplicity or the indivisible, which are elements in the definition of number. In neither kind of attribution can the terms be infinite.¹ They are not infinite where each is related to the term below it as odd is to number, for this would mean the inherence in odd of another attribute of odd in whose nature odd was an essential element: but then number ²⁰ will be an ultimate subject of the whole infinite chain of attributes, and be an element in the definition of each of them. Hence, since an infinity of attributes such as contain their subject in their definition cannot inhere in a single thing, the ascending series is equally finite.² Note, more-

ordinate to a higher predicate also predicable of that subject [i. e. not to a wider predicate but to a middle term giving logically prior premisses and in that sense higher], then the inherence can be known by demonstration and only by demonstration. But that means that it is known as the consequent of an antecedent. Therefore, if demonstration gives genuine knowledge, the series must terminate; i. e. every predicate is demonstrable and known only as a consequent and therefore hypothetically, unless an antecedent known *per se* is reached.

¹ Analytic proof [i. e. a proof from the appropriate *ἀρχαί* of the subject which Aristotle is here treating, namely τὰ ἀναλυτικά: cf. the frequent corresponding use of φυσικώς. Note, however, that τὰ ἀναλυτικά have no proper place in Aristotle's classification of the sciences: there is no special γένος of reality forming their subject-matter]. Demonstration proves the inherence in subjects of attributes essential either (1) because they are elements in their subject's definition, e. g. multiplicity or the indivisible [reading in 84^a 16 ἀδιαίρετον with the first hand of D. Number = πλῆθος ἀδιαίρετων, cf. *Met.* 1085^b 22]; or (2) because their subjects are elements in their definition, as e. g. odd [περιττόν in * 14 is really an abbreviation for περιττόν καὶ ἄρτιον, cf. i, ch. 4, 73^a 39] in relation to number. Attribution of neither type of attribute can beget an infinite series

² As regards type (2) [the opening of the chapter has disposed of type (1)]: in any series of such predicates any given term will contain

over, that all such attributes must so inhere in the ultimate subject—e. g. its attributes in number and number in them—as to be commensurate with the subject and not of wider
 25 extent. Attributes which are essential elements in the nature of their subjects are equally finite: otherwise definition would be impossible. Hence, if all the attributes predicated are essential and these cannot be infinite, the ascending series will terminate, and consequently the descending series too.¹

If this is so, it follows that the intermediates between any two terms are also always limited in number.² An imme-
 30 diately obvious consequence of this is that demonstrations necessarily involve basic truths, and that the contention of some—referred to at the outset—that all truths are demonstrable is mistaken. For if there are basic truths, (a) not all truths are demonstrable, and (b) an infinite regress is impossible; since if either (a) or (b) were not a fact, it would mean that no interval was immediate and
 35 indivisible, but that all intervals were divisible. This is true because a conclusion is demonstrated by the interposition, not the apposition, of a fresh term. If such interposition could continue to infinity there might be an infinite number of terms between any two terms; but this is im-
 84^b possible if both the ascending and descending series of predication terminate; and of this fact, which before was shown dialectically, analytic proof has now been given.³

in its definition all the lower terms, and the series will therefore terminate at the bottom in the ultimate subject. But since every term down to and including the ultimate subject is contained in the definition of any given term, if the series ascend infinitely there must be a term containing an infinity of terms in its definition. But this is impossible, and therefore the ascent terminates.

¹ Note too that either type of essential attribute must be commensurate with its subject, because the first defines, the second is defined by, its subject; and consequently no subject can possess an infinite number of essential predicates of either type, or definition would be impossible. Hence if the attributes predicated are all essential, the series terminates in both directions. [This passage merely displays the ground underlying the previous argument that the ascent of attributes of type (2) is finite, and notes in passing its more obvious and already stated application to attributes of type (1).]

² It follows that the intermediates between a given subject and a given attribute must also be limited in number.

³ Corollary: (a) demonstrations necessarily involve basic truths,

- 23 It is an evident corollary of these conclusions that if the same attribute *A* inheres in two terms *C* and *D* predicable either not at all, or not of all instances, of one another, it 5 does not always belong to them in virtue of a common middle term. Isosceles and scalene possess the attribute of having their angles equal to two right angles in virtue of a common middle; for they possess it in so far as they are both a certain kind of figure, and not in so far as they differ from one another. But this is not always the case; for, were it so, if we take *B* as the common middle in virtue of which *A* inheres in *C* and *D*, clearly *B* would inhere in *C* 10 and *D* through a second common middle, and this in turn would inhere in *C* and *D* through a third, so that between two terms an infinity of intermediates would fall—an impossibility. Thus it need not always be in virtue of a common middle term that a single attribute inheres in several subjects, since there must be immediate intervals. Yet if the attribute to be proved common to two subjects 15 is to be one of their essential attributes, the middle terms involved must be within one subject genus and be derived from the same group of immediate premisses; for we have seen that processes of proof cannot pass from one genus to another.¹

It is also clear that when *A* inheres in *B*, this can be demonstrated if there is a middle term. Further, the 20 'elements' of such a conclusion are the premisses contain-

and therefore (*δ*) not all truths, as we saw [84^a 32] that some maintain, are demonstrable [cf. 72^b 6]. If either (*α*) or (*β*) were not a fact, since conclusions are demonstrated by the interposition of a middle and not by the apposition of an extreme term [cf. note on 78^a 15], no premiss would be an immediate indivisible interval. This closes the analytic argument.

[Thus the nerve of the dialectical and analytic arguments is the same: they differ only in that the former covers all syllogism. The basis of Aristotle's contention is that predication is always a synthesis of determinate elements, a concrete whole which is essentially not *ἀντιστοιχεί*. Unfortunately for Aristotle's point this contention, however sound, involves the reciprocal interdependence of the elements of such a synthesis and, ultimately, of all the terms of a series of predication. It may prove that the series of predication cannot contain an infinity of terms, but it does not prove that it is terminated by self-evident *ἀρχαί*, true within their own four corners. It is questionable how far Aristotle's logical system can survive this chapter.]

¹ i, ch. 7.

ing the middle in question, and they are identical in number with the middle terms, seeing that the immediate propositions—or at least such immediate propositions as are universal—are the ‘elements’. If, on the other hand, there is no middle term, demonstration ceases to be possible: we are on the way to the basic truths. Similarly if *A* does not inhere in *B*, this can be demonstrated if there is a middle
 25 term or a term prior to *B* in which *A* does not inhere: otherwise there is no demonstration and a basic truth is reached.¹ There are, moreover, as many ‘elements’ of the demonstrated conclusion as there are middle terms, since it is propositions containing these middle terms that are the basic premisses on which the demonstration rests; and as there are some indemonstrable basic truths asserting that ‘this is that’ or that ‘this inheres in that’, so there are
 30 others denying that ‘this is that’ or that ‘this inheres in that’—in fact some basic truths will affirm and some will deny being.

When we are to prove a conclusion, we must take a primary essential predicate—suppose it *C*—of the subject *B*, and then suppose *A* similarly predicable of *C*. If we proceed in this manner, no proposition or attribute which falls beyond *A* is admitted in the proof: the interval is constantly condensed until subject and predicate become
 35 indivisible, i.e. one. We have our unit when the premiss becomes immediate,² since the immediate premiss alone is a single premiss in the unqualified sense of ‘single’. And as in other spheres the basic element is simple but not identical in all—in a system of weight it is the mina, in music the quarter-tone, and so on—so in syllogism the unit
 85^a is an immediate premiss, and in the knowledge that demonstration gives it is an intuition.³ In syllogisms, then, which prove the inherence of an attribute, nothing falls outside the major term. In the case of negative syllogisms on the other hand, (1) in the first figure nothing falls outside the

¹ Placing a full stop after ἀρχή in ^b 26.

² Placing a comma after γένεται in ^b 36.

³ νοῦς grasps immediately an indivisible reality—e.g. the τι ἢν εἶναι of a substance the elements of which are not predicated of one another Cf. 77^a 4, 88^b 35–7, and notes thereon.

major term whose inherence is in question; e.g. to prove through a middle *C* that *A* does not inhere in *B* the premisses required are, all *B* is *C*, no *C* is *A*. Then if it has 5 to be proved that no *C* is *A*, a middle must be found between *A* and *C*; and this procedure will never vary.

(2) If we have to show that *E* is not *D* by means of the premisses, all *D* is *C*; no *E*, or not all *E*,¹ is *C*; then the middle will never fall beyond *E*, and *E* is the subject of which *D* is to be denied in the conclusion.

(3) In the third figure the middle will never fall beyond 10 the limits of the subject and the attribute denied of it.

- 24 Since demonstrations may be either commensurately universal or particular,² and either affirmative or negative; the question arises, which form is the better? And the same 15 question may be put in regard to so-called 'direct' demonstration and *reductio ad impossibile*. Let us first examine the commensurately universal and the particular forms, and when we have cleared up this problem proceed to discuss 'direct' demonstration and *reductio ad impossibile*.

The following considerations might lead some minds to 20 prefer particular demonstration.

(1) The superior demonstration is the demonstration which gives us greater knowledge (for this is the ideal of demonstration), and we have greater knowledge of a particular individual when we know it in itself than when we know it through something else; e.g. we know Coriscus the musician better when we know that Coriscus is musical than 25 when we know only that man is musical, and a like argument holds in all other cases. But commensurately universal demonstration, instead of proving that the subject itself actually is *x*, proves only that something else is *x*—e.g. in attempting to prove that isosceles is *x*, it proves not that isosceles but only that triangle is *x*—whereas particular demonstration proves that the subject itself is *x*. The demonstration, then, that a subject, as such, possesses an attribute is superior. If this is so, and if the particular

¹ Second figure, Camestres or Baroco.

² The distinction is that of whole and part, genus and species; not that of universal and singular.

rather than the commensurately universal form so demonstrates, particular demonstration is superior.

(2) The universal has not a separate being over against groups of singulars. Demonstration nevertheless creates the opinion that its function is conditioned by something like this—some separate entity belonging to the real world; that, for instance, of triangle or of figure or number, over against particular triangles, figures, and numbers. But demonstration which touches the real and will not mislead is superior to that which moves among unrealities and is delusory. Now commensurately universal demonstration is of the latter kind: if we engage in it we find ourselves reasoning after a fashion well illustrated by the argument that the proportionate is what answers to the definition of some entity which is neither line, number, solid, nor plane, but a proportionate apart from all these. Since, then, such a proof is characteristically commensurate and universal, and less touches reality than does particular demonstration, and creates a false opinion, it will follow that commensurate and universal is inferior to particular demonstration.

We may retort thus. (1) The first argument applies no more to commensurate and universal than to particular demonstration. If equality to two right angles is attributable to its subject not *qua* isosceles but *qua* triangle, he who knows that isosceles possesses that attribute knows the subject as *qua* itself possessing the attribute, to a less degree than he who knows that triangle has that attribute. To sum up the whole matter: if a subject is proved to possess *qua* triangle an attribute which it does not in fact possess *qua* triangle, that is not demonstration: but if it does possess it *qua* triangle, the rule applies that the greater knowledge is his who knows the subject as possessing its attribute *qua* that in virtue of which it actually does possess it. Since, then, triangle is the wider term, and there is one identical definition of triangle—i.e. the term is not equivocal—and since equality to two right angles belongs to all triangles, it is isosceles *qua* triangle and not triangle *qua* isosceles which has its angles so related. It follows that he who knows a connexion universally has greater knowledge of it as it in

fact is than he who knows the particular; and the inference is that commensurate and universal is superior to particular demonstration.

(2) If there is a single identical definition—i.e. if the commensurate universal is unequivocal—then the universal will possess being not less but more than some of the particulars, inasmuch as it is universals which comprise the imperishable, particulars that tend to perish.

(3) Because the universal has a single meaning, we are not therefore compelled to suppose that in these examples it has being as a substance apart from its particulars—any more than we need make a similar supposition in the other cases of unequivocal universal predication, viz. where the predicate signifies not substance but quality, essential relatedness, or action. If such a supposition is entertained, the blame rests not with the demonstration but with the hearer.

(4) Demonstration is syllogism that proves the cause, i.e. the reasoned fact, and it is rather the commensurate universal than the particular which is causative (as may be shown thus: that which possesses an attribute through its own essential nature is itself the cause of the inherence, and the commensurate universal is primary;¹ hence the commensurate universal is the cause). Consequently commensurately universal demonstration is superior as, more especially proving the cause, that is the reasoned fact.

(5) Our search for the reason ceases, and we think that we know, when the coming to be or existence of the fact before us is not due to the coming to be or existence of some other fact, for the last step of a search thus conducted is *eo ipso* the end and limit of the problem. Thus: 'Why did he come?' 'To get the money—wherewith to pay a debt—that he might thereby do what was right.' When in this regress we can no longer find an efficient or final cause, we regard the last step of it as the end of the coming—or being or coming to be—and we regard ourselves as then only having full knowledge of the reason why he came.

If, then, all causes and reasons are alike in this respect,

¹ And therefore also essential; cf. i, ch. 4, 73^b 26 ff.

and if this is the means to full knowledge in the case of final causes such as we have exemplified, it follows that in the case of the other causes also full knowledge is attained when an attribute no longer inheres because of something else. Thus, when we learn that exterior angles are equal to four right angles because they are the exterior angles of an isosceles, there still remains the question 'Why has
86^a isosceles this attribute?' and its answer 'Because it is a triangle, and a triangle has it because a triangle is a rectilinear figure.' If rectilinear figure possesses the property for no further reason,¹ at this point we have full knowledge—but at this point our knowledge has become commensurately universal, and so we conclude that commensurately universal demonstration is superior.

(6) The more demonstration becomes particular the more it sinks into an indeterminate manifold, while universal demonstration tends to the simple and determinate. But objects so far as they are an indeterminate manifold are unintelligible, so far as they are determinate, intelligible: they are therefore intelligible rather in so far as they are universal than in so far as they are particular. From this it follows that universals are more demonstrable: but since relative and correlative increase concomitantly, of the more demonstrable there will be fuller demonstration. Hence the commensurate and universal form, being more truly
10 demonstration, is the superior.

(7) Demonstration which teaches two things is preferable to demonstration which teaches only one. He who possesses commensurately universal demonstration knows the particular as well, but he who possesses particular demonstration does not know the universal. So that this is an additional reason for preferring commensurately universal demonstration. And there is yet this further argument:

(8) Proof becomes more and more proof of the commensurate universal as its middle term approaches nearer to the
15 basic truth, and nothing is so near as the immediate premiss which is itself the basic truth. If, then, proof from the basic truth is more accurate than proof not so derived,

¹ i. e. for no reason other than its own nature.

demonstration which depends more closely on it is more accurate than demonstration which is less closely dependent. But commensurately universal demonstration is characterized by this closer dependence, and is therefore superior. Thus, if *A* had to be proved to inhere in *D*, and the middles were *B* and *C*, *B* being the higher term would render the demonstration which it mediated the more universal. 20

Some of these arguments, however, are dialectical. The clearest indication of the precedence of commensurately universal demonstration is as follows: if of two propositions, a prior and a posterior, we have a grasp of the prior, we have a kind of knowledge—a potential grasp—of the posterior as well. For example, if one knows that the angles of all 25 triangles are equal to two right angles, one knows in a sense—potentially—that the isosceles' angles also are equal to two right angles, even if one does not know that the isosceles is a triangle; but to grasp this posterior proposition is by no means to know the commensurate universal either potentially or actually. Moreover, commensurately universal demonstration is through and through intelligible; particular demonstration issues in sense-perception. 30

- 25 The preceding arguments constitute our defence of the superiority of commensurately universal to particular demonstration. That affirmative demonstration excels negative may be shown as follows.

(1) We may assume the superiority *ceteris paribus* of the demonstration which derives from fewer postulates or hypotheses—in short from fewer premisses; for, given that all 35 these are equally well known, where they are fewer knowledge will be more speedily acquired, and that is a desideratum. The argument implied in our contention that demonstration from fewer assumptions is superior may be set out in universal form as follows.¹ Assuming that in both cases alike the middle terms are known, and that middles which are prior are better known than such as are posterior, we may suppose two demonstrations of the inherence of *A* in *E*, the one proving it through the middles *B*, *C* and *D*, the other 86^b

¹ Reading καθόλου ὅδε with Waitz; D καθόλου ὅδε.

through *F* and *G*. Then¹ *A-D* is known to the same degree as *A-E* (in the second proof), but *A-D* is better known than and prior to *A-E* (in the first proof); since *A-E* is proved through *A-D*, and the ground is more certain than the conclusion.²

5 Hence demonstration by fewer premisses is *ceteris paribus* superior. Now both affirmative and negative demonstration operate through three terms and two premisses, but whereas the former assumes only that something is, the latter assumes both that something is and that something else is not, and thus operating through more kinds of premiss³ is inferior.

10 (2) It has been proved⁴ that no conclusion follows if both premisses are negative, but that one must be negative, the other affirmative. So we are compelled to lay down the following additional rule: as the demonstration expands, the affirmative premisses must increase in number, but there
15 cannot be more than one negative premiss in each complete proof.⁵ Thus, suppose no *B* is *A*, and all *C* is *B*. Then, if both the premisses are to be again expanded, a middle must be interposed. Let us interpose *D* between *A* and *B*, and *E* between *B* and *C*. Then clearly *E* is affirmatively
20 related to *B* and *C*, while *D* is affirmatively related to *B* but negatively to *A*; for all *B* is *D*, but there must be no *D* which is *A*. Thus there proves to be a single negative premiss, *A-D*. In the further prosyllogisms too it is the same, because in the terms of an affirmative syllogism the middle is always related affirmatively to both extremes; in
25 a negative syllogism it must be negatively related only to one of them, and so this negation comes to be a single negative premiss, the other premisses being affirmative. If,

² The two proofs are (1) $\begin{array}{l} A-B \\ B-C \\ \therefore A-C \\ C-D \\ \therefore A-D \\ D-E \\ \therefore A-E \end{array}$ (2) $\begin{array}{l} A-F \\ F-G \\ \therefore A-G \\ G-E \\ \therefore A-E \end{array}$

³ 'Specie non numero plura', Zabarella.

⁴ *An. Pr.* i, ch. 7.

⁵ i. e. in one syllogism and two prosyllogisms proving its premisses.

then, that through which a truth is proved is a better known and more certain truth, and if the negative proposition is proved through the affirmative and not vice versa, affirmative demonstration, being prior and better known and more certain, will be superior.

(3) The basic truth of demonstrative syllogism is the 30 universal immediate premiss, and the universal premiss asserts in affirmative demonstration and in negative denies: and the affirmative proposition is prior to and better known than the negative (since affirmation explains denial and is prior to denial, just as being is prior to not-being). It follows 35 that the basic premiss of affirmative demonstration is superior to that of negative demonstration, and the demonstration which uses superior basic premisses is superior.

(4) Affirmative demonstration is more of the nature of a basic form of proof, because it is a *sine qua non* of negative demonstration.

- 26 Since affirmative demonstration is superior to negative, it 87^a is clearly superior also to *reductio ad impossibile*. We must first make certain what is the difference between negative demonstration and *reductio ad impossibile*. Let us suppose that no *B* is *A*, and that all *C* is *B*: the conclusion necessarily follows that no *C* is *A*. If these premisses are assumed, 5 therefore, the negative demonstration that no *C* is *A* is direct. *Reductio ad impossibile*, on the other hand, proceeds as follows. Supposing we are to prove that *A* does not inhere in *B*, we have to assume that it does inhere, and further that *B* inheres in *C*, with the resulting inference that *A* inheres in *C*. This we have to suppose a known and admitted impossibility; and we then infer that *A* cannot inhere in *B*. 10 Thus if the inherence of *B* in *C* is not questioned, *A*'s inherence in *B* is impossible.

The order of the terms is the same in both proofs: they differ according to which of the negative propositions is the better known, the one denying *A* of *B* or the one denying *A* of *C*. When the falsity of the conclusion¹ is the better

¹ i.e. the impossibility of *A-C*, the conclusion of the hypothetical syllogism.

15 known, we use *reductio ad impossibile*; when the major
 premiss of the syllogism is the more obvious, we use direct
 demonstration. All the same the proposition denying *A* of
B is, in the order of being, prior to that denying *A* of *C*; for
 premisses are prior to the conclusion which follows from
 them, and 'no *C* is *A*' is the conclusion, 'no *B* is *A*' one of
 20 its premisses. For the destructive result of *reductio ad*
impossibile is not a proper conclusion, nor are its antecedents
 proper premisses. On the contrary: the constituents of
 syllogism are premisses related to one another as whole to
 part or part to whole,¹ whereas the premisses *A-C* and *A-B*
 25 are not thus related to one another. Now the superior
 demonstration is that which proceeds from better known
 and prior premisses, and while both these forms depend for
 credence on the not being of something, yet the source of
 the one is prior to that of the other. Therefore negative
 demonstration will have an unqualified superiority to *reductio*
ad impossibile, and affirmative demonstration, being superior
 to negative, will consequently be superior also to *reductio ad*
 30 *impossibile*.

The science which is knowledge at once of the fact and 27
 of the reasoned fact, not of the fact by itself without the
 reasoned fact, is the more exact and the prior science.

A science such as arithmetic, which is not a science of
 properties *qua* inhering in a substratum, is more exact than
 and prior to a science like harmonics, which is a science of
 properties inhering in a substratum; and similarly a science
 like arithmetic, which is constituted of fewer basic elements,
 is more exact than and prior to geometry, which requires
 35 additional elements. What I mean by 'additional elements'
 is this: a unit is substance without position, while a point is
 substance with position; the latter contains an additional
 element.

¹ Deleting commas after *οὐ* and *ἐστίν* in * 22. In *An. Pr.* 25^b 32-5
 Aristotle defines the first figure as that in which the middle term is
 contained in the major as in a whole and the minor is contained in
 the middle as in a whole. Hence major premiss is related to minor
 as whole to part. The first figure is perfect because it displays the
 natural organic movement of thought from minor through middle to
 major. *Reductio ad impossibile* perverts this natural movement and its
 'premisses' do not stand in this organic relation.

- 28 A single science is one whose domain is a single genus, viz. all the subjects constituted out of the primary entities of the genus—i.e. the parts of this total subject—and their essential properties.

One science differs from another when their basic truths have neither a common source nor are derived those of the one science¹ from those of the other. This is verified when 87^b we reach the indemonstrable premisses of a science, for they must be within one genus with its conclusions: and this again is verified if the conclusions proved by means of them fall within one genus—i. e. are homogeneous.

- 29 One can have several demonstrations of the same connexion not only by taking from the same series of predication middles which are other than the immediately cohering term²—e.g. by taking *C*, *D*, and *F* severally to prove *A-B*—but also by taking a middle from another series. Thus let *A* be change, *D* alteration of a property, *B* feeling pleasure, and *G* relaxation. We can then without falsehood predicate *D* of *B* and *A* of *D*, for he who is pleased 10 suffers alteration of a property, and that which alters a property changes. Again, we can predicate *A* of *G* without falsehood, and *G* of *B*; for to feel pleasure is to relax, and to relax is to change. So the conclusion can be drawn through middles which are different, i. e. not in the same series—yet not so that neither of these middles is predicable of the other, for they must both be attributable to some one 15 subject.

A further point worth investigating is how many ways of proving the same conclusion can be obtained by varying the figure.

- 30 There is no knowledge by demonstration of chance conjunctions; for chance conjunctions exist neither by necessity nor as general connexions but comprise what 20 comes to be as something distinct from these. Now demonstration is concerned only with one or other of these two; for all reasoning proceeds from necessary or general premisses, the conclusion being necessary if the premisses

¹ Reading ἀρεται.

² Cf. note on 95^b 3 and 4.

are necessary and general if the premisses are general. Consequently, if chance conjunctions are neither general nor necessary, they are not demonstrable.

Scientific knowledge is not possible through the act of perception. Even if perception as a faculty is of 'the such' and not merely of a 'this somewhat',¹ yet one must at any rate actually perceive a 'this somewhat', and at a definite present place and time: but that which is commensurately universal and true in all cases one cannot perceive, since it is not 'this' and it is not 'now'; if it were, it would not be commensurately universal—the term we apply to what is always and everywhere. Seeing, therefore, that demonstrations are commensurately universal and universals imperceptible, we clearly cannot obtain scientific knowledge by the act of perception: nay, it is obvious that even if it were possible to perceive that a triangle has its angles equal to two right angles, we should still be looking for a demonstration—we should not (as some² say) possess knowledge of it; for perception must be of a particular, whereas scientific knowledge involves the recognition of the commensurate universal. So if we were on the moon, and saw the earth shutting out the sun's light, we should not know the cause of the eclipse: we should perceive the present fact of the eclipse, but not the reasoned fact at all, since the act of perception is not of the commensurate universal. I do not, of course, deny that by watching the frequent recurrence of this event we might, after tracking the commensurate universal, possess a demonstration, for the commensurate universal is elicited from the several groups of singulars.

The commensurate universal is precious because it makes clear the cause; so that in the case of facts like these which have a cause other than themselves universal knowledge³ is more precious than sense-perceptions and than intuition. (As regards primary truths there is of course a different account to be given.⁴) Hence it is clear that knowledge of

¹ Cf. note on 73^b 7.

² Protagoras is perhaps referred to.

³ i. e. demonstration through the commensurate universal.

⁴ Cf. e. g. 100^b 12.

things demonstrable¹ cannot be acquired by perception, unless the term perception is applied to the possession of 10 scientific knowledge through demonstration. Nevertheless certain points do arise with regard to connexions to be proved which are referred for their explanation to a failure in sense-perception: there are cases when an act of vision would terminate our inquiry, not because in seeing we should be knowing, but because we should have elicited the universal from seeing; if, for example, we saw the pores in the glass and the light passing through, the reason of the 15 kindling would be clear to us² because we should at the same time see it in each instance and intuit that it must be so in all instances.

- 32 All syllogisms cannot have the same basic truths. This may be shown first of all by the following dialectical considerations. (1) Some syllogisms are true and some false: for though a true inference is possible from false 20 premisses, yet this occurs once only—I mean if *A*, for instance, is truly predicable of *C*, but *B*, the middle, is false, both *A-B* and *B-C* being false; nevertheless, if middles are taken to prove these premisses, they will be false because every conclusion which is a falsehood has false premisses, 25 while true conclusions have true premisses, and false and true differ in kind. Then again, (2) falsehoods are not all derived from a single identical set of principles: there are falsehoods which are the contraries of one another and cannot coexist, e.g. 'justice is injustice', and 'justice is cowardice'; 'man is horse', and 'man is ox'; 'the equal is greater', and 'the equal is less.' From our established principles we may argue the 30 case as follows, confining ourselves therefore to true conclusions. Not even all these are inferred from the same basic truths; many of them in fact have basic truths which differ generically and are not transferable; units, for instance, which are without position, cannot take the place of points, which have position. The transferred terms could only fit

¹ Reading ἀποδείκτων with Waitz; cf. 90^b 10 and note.

² A theory of the concentration of rays through a burning-glass which was not Aristotle's.

35 in as middle terms or as major or minor terms, or else have some of the other terms between them, others outside them.¹

Nor can any of the common axioms—such, I mean, as the law of excluded middle—serve as premisses for the 88^b proof of all conclusions. For the kinds of being are different, and some attributes attach to *quanta* and some to *qualia* only; and proof is achieved by means of² the common axioms taken in conjunction with these several kinds and their attributes.

Again,³ it is not true that the basic truths are much fewer 5 than the conclusions, for the basic truths are the premisses, and the premisses are formed by the apposition of a fresh extreme term or the interposition of a fresh middle. Moreover, the number of conclusions is indefinite, though the number of middle terms is finite; and lastly some of the basic truths are necessary, others variable.

¹ i.e. the transference of *ἀρχαί* from one science to another must mean that the terms of which they consist will appear in the second science either always as middles or always as majors or always as minors, or else now as middles between terms native to the second science, now as extreme terms linked by middles native to the second science: therefore the second science would contain a demonstration the terms of which were not within one genus, and therefore not predicable *καθ' αὐτό* of one another—as Aristotle has shown *passim*, cf. e.g. 75^b 10–12. The usually assumed reference to the figures of syllogism seems irrelevant.

² N.B. *διά*, not *ἐκ*: i.e. if demonstration is to be possible, you require premisses containing the genus and its properties, as well as the *κοινὰ ἀξιώματα* as regulative canons.

³ The argument from *εἴτε αἱ ἀρχαί* 88^b 3 to *ἐνδεχόμεναι* in 88 appears to be as follows: 'Actually, the conclusions are many; but if the *ἀρχαί* of all demonstration were the same, there would only be a few conclusions.' But it is not true that the *ἀρχαί* are much fewer than the conclusions, for the *ἀρχαί* are the premisses, and the premisses are formed either (1) by the apposition of fresh extreme terms, or (2) by the interpolation of fresh middles (and therefore in (1) you get a fresh *ἀρχή* for every fresh conclusion, the other premiss being a previous conclusion (cf. note on 76^a 14); while in (2) the premisses become each in turn a conclusion). Moreover the number of conclusions is indefinite (∴ once again that of the *ἀρχαί* cannot be small)—though of course (if you are proceeding by *πυκνωσις* of a *διάστημα* requiring mediation) the middle terms (required before you reach immediate premisses) are not indefinite in number. Finally there are variable as well as necessary *ἀρχαί* (and therefore once more the number cannot be small).'

The last sentence is a final argument that the *ἀρχαί* are not few in number, and is admissible because the whole treatment is dialectical, cf. 88^a 19.

Looking at it in this way we see that, since the number of conclusions is indefinite, the basic truths cannot be identical or¹ limited in number. If, on the other hand, identity is used¹⁰ in another sense, and it is said, e. g., 'these and no other are the fundamental truths of geometry, these the fundamentals of calculation, these again of medicine'; would the statement mean anything except that the sciences have basic truths? To call them identical because they are self-identical is absurd, since everything can be identified with everything in that sense of identity. Nor again can the contention¹⁵ that all conclusions have the same basic truths mean that from the mass of all possible premisses any conclusion may be drawn. That would be exceedingly naïve, for it is not the case in the clearly evident mathematical sciences, nor is it possible in analysis, since it is the immediate premisses which are the basic truths, and a fresh conclusion is only formed by the addition of a new immediate premiss²: but if it be²⁰ admitted that it is these primary immediate premisses which are basic truths, each subject-genus will provide one basic truth.³ If, however, it is not argued that from the mass of all possible premisses any conclusion may be proved, nor yet admitted that basic truths differ so as to be generically different for each science, it remains to consider the possibility that, while the basic truths of all knowledge are within one genus, special premisses are required to prove special conclusions. But that this cannot be the case has²⁵ been shown by our proof that the basic truths of things generically different themselves differ generically. For fundamental truths are of two kinds, those which are premisses of demonstration⁴ and the subject-genus; and though the former are common, the latter—number, for instance, and magnitude—are peculiar.

¹ Reading ἡ πεπρασμένη with D.

² Such a suggestion would be stupid (1) because you can see at once—so clear are they—that the demonstrations which build up the mathematical sciences by synthesis from their basic elements do not all start from the same ἀρχαί; and (2) because in analysis of a conclusion into its ultimate premisses (= from the complementary point of view πύκνωσις of a διόστημι) different ἀρχαί are reached in different sciences.

³ sc. 'at least one—its own definition'.

⁴ Cf. note on 75^b 2.

30 Scientific knowledge and its object differ from opinion and the object of opinion in that scientific knowledge is commensurately universal and proceeds by necessary connexions, and that which is necessary cannot be otherwise. So though there are things which are true and real and yet can be otherwise, *scientific knowledge* clearly does not concern them: if it did, things which can be otherwise would
 35 be incapable of being otherwise. Nor are they any concern of *rational intuition*—by rational intuition I mean an originative source of scientific knowledge—nor of indemonstrable knowledge,¹ which is the grasping of the
 89^a immediate premiss. Since then rational intuition, science, and opinion, and what is revealed by these terms, are the only things that can be 'true', it follows that it is *opinion* that is concerned with that which may be true or false, and can be otherwise: opinion in fact is the grasp of a premiss which is immediate but not necessary. This view also fits
 5 the observed facts, for opinion is unstable, and so is the kind of being we have described as its object. Besides, when a man thinks a truth incapable of being otherwise he always thinks that he knows it, never that he opines it. He thinks that he opines when he thinks that a connexion, though actually so, may quite easily be otherwise; for he believes
 10 that such is the proper object of opinion, while the necessary is the object of knowledge.

In what sense, then, can the same thing be the object of both opinion and knowledge? And if any one chooses to maintain that all that he knows he can also opine, why should not² opinion be knowledge? For he that knows and he that opines will follow the same train of thought through the same middle terms until the immediate premisses are
 15 reached; because it is possible to opine not only the fact but also the reasoned fact, and the reason is the middle term; so that, since the former knows, he that opines also has knowledge.

The truth perhaps is that if a man grasp truths that

¹ γούρς (cf. notes on 85^a 1 and 77^a 4) grasps the individual nature, τὸ τί ἦν εἶναι or the definition, as a unity; ἐπιστήμη ἀναπόδεικτος gives this as a premiss.

² Reading ἔστιν for ἔστιν with A, B, C, and Waitz.

cannot be other than they are, in the way in which he grasps¹ the definitions through which demonstrations take place, he will have not opinion but knowledge: if on the other hand he apprehends these attributes as inhering in their subjects, but not in virtue of the subjects' substance and essential nature, he possesses opinion and not genuine²⁰ knowledge; and his opinion, if obtained through immediate premisses, will be both of the fact and of the reasoned fact; if not so obtained, of the fact alone. The object of opinion and knowledge is not quite identical: it is only in a sense identical, just as the object of true and false opinion is in a sense identical. The sense in which some maintain that²⁵ true and false opinion can have the same object leads them to embrace many strange doctrines, particularly the doctrine that what a man opines falsely he does not opine at all. There are really many senses of 'identical', and in one sense the object of true and false opinion can be the same, in another it cannot. Thus, to have a true opinion that the diagonal is commensurate with the side would be absurd:³⁰ but because the diagonal with which they are both concerned is the same, the two opinions have objects so far the same: on the other hand, as regards their essential definable nature these objects differ. The identity of the objects of knowledge and opinion is similar. Knowledge is the apprehension of, e. g., the attribute 'animal' as incapable of being otherwise, opinion the apprehension of 'animal' as capable of being otherwise—e. g. the apprehension that³⁵ animal is an element in the essential nature of man is knowledge; the apprehension of animal as predicable of man but not as an element in man's essential nature is opinion: man is the subject in both judgments, but the mode of inherence differs.

This also shows that one cannot opine and know the same thing simultaneously; for then one would apprehend the same thing as both capable and incapable of being otherwise—an impossibility. Knowledge and opinion of^{89^b} the same thing can coexist in two different people in the sense we have explained, but not simultaneously in the

¹ Reading $\epsilon\chi\epsilon\iota$ with MSS.

same person. That would involve a man's simultaneously apprehending, e. g., (1) that man is essentially animal—i. e. cannot be other than animal—and (2) that man is not essentially animal, that is, we may assume,¹ may be other than animal.

Further consideration of modes of thinking and their distribution under the heads of discursive thought, intuition, science, art, practical wisdom, and metaphysical thinking, belongs rather partly to natural science, partly to moral philosophy.

- 10 Quick wit is a faculty of hitting upon the middle term ⁷ instantaneously. It would be exemplified by a man who saw that the moon has her bright side always turned towards the sun, and quickly grasped the cause of this, namely that she borrows her light from him; or observed somebody in conversation with a man of wealth and divined that he was borrowing money, or that the friendship of these people sprang from a common enmity. In all these instances he has seen the major and minor terms and then
15 grasped the causes, the middle terms.

Let *A* represent 'bright side turned sunward', *B* 'lighted from the sun', *C* the moon. Then *B*, 'lighted from the sun', is predicable of *C*, the moon, and *A*, 'having her bright side towards the source of her light', is predicable of *B*.
20 So *A* is predicable of *C* through *B*.

¹ Reading ~~εἴτω~~ with B, C, and Waitz.

BOOK II

1 THE kinds of question we ask are as many as the kinds of things which we know. They are in fact four:—(1) whether the connexion of an attribute with a thing is a fact, (2) what is the reason of the connexion, (3) whether a thing exists, (4) what is the nature of the thing. Thus, when our²⁵ question concerns a complex of thing and attribute¹ and we ask whether the thing is thus or otherwise qualified—whether, e.g., the sun suffers eclipse or not—then we are asking as to the fact of a connexion. That our inquiry ceases with the discovery that the sun does suffer eclipse is an indication of this; and if we know from the start that the sun suffers eclipse, we do not inquire whether it does so or not. On the other hand, when we know the fact we ask the reason; as, for example, when we know that the sun is being eclipsed and that an earthquake is in progress, it is the reason of³⁰ eclipse or earthquake into which we inquire.

Where a complex is concerned, then, those are the two questions we ask; but for some objects of inquiry we have a different kind of question to ask, such as whether there is or is not a centaur or a God. (By 'is or is not' I mean 'is or is not, without further qualification'; as opposed to 'is or is not (e.g.) white'.) On the other hand, when we have ascertained the thing's existence, we inquire as to its nature, asking, for instance, 'what, then, is God?' or 'what is man?'.

35

2 These, then, are the four kinds of question we ask, and it is in the answers to these questions that our knowledge consists.²

¹ So Zabarella and Pacius explain *εἰς ἀριθμὸν θέντες*. Waitz takes it as meaning 'enumerating the alternative possibilities'.

² In ch. 1 Aristotle has distinguished four forms of inquiry, and the enumeration is taken to be exhaustive. These were: (1) *τὸ ὅτι*, 'Is *S* *P*?' (2) *τὸ διότι*, 'Why is *S* *P*?' (3) *εἰ ἔστι*, 'Does *S* exist?' (4) *τί ἐστι*, 'What is *S*?'. (1) answered affirmatively provokes (2), and (3) answered affirmatively provokes (4). In ch. 2 we learn that all four questions are questions as to the cause; that 'Is *S* *P*?' means 'Has *P*-*S* a cause?', and that 'Does *S* exist?' means 'Has *S* a

Now when we ask whether a connexion is a fact, or whether a thing without qualification *is*, we are really asking whether the connexion or the thing has a 'middle';¹ and when we have ascertained either that the connexion is a fact or that the thing *is*—i.e. ascertained either the partial or the
 90^a unqualified being of the thing—and are proceeding to ask the reason of the connexion or the nature of the thing, then we are asking what the 'middle' is

(By distinguishing the fact of the connexion and the cause'; and again that 'Why is *S* *P*?' means 'What is the cause of *P*—*S*?', and 'What is *S*?' means 'What causes *S*?')

This is obscurely worked out because Aristotle is hampered by his theory of predication. On the one hand (A) all four questions ask the cause of the being of *S*, which is a substance, (1) and (2) ask respectively 'Is there a cause' and 'What is the cause' of *S* having being as the subject of an attribute—i.e. they seek a cause of part of *S*'s being, *S*'s being in so far as *S* is *P*, while (3) and (4) ask respectively 'Is there a cause' and 'What is the cause' of *S* having being as a substance—i.e. they inquire as to a cause of the complete unqualified (*ἀπλῶς*) being of *S*. On the other hand, (B) (1) and (2) in asking the cause of *S* being *P*, are really asking 'What is the cause of *P*?', for *P*'s being consists in its inherence in *S*. This seems to distinguish (1) and (2) as concerning the cause of attributes from (3) and (4) as concerning the cause of substances. But you can also ask (3) and (4) of an attribute—*S* need not be a substance—e.g. *νύξ* in 90^b 5, given as an instance of a *ἀπλῶς ὄν*, is an attribute, a δ in ^a 15 ff (where *τι ἐστὶν ἐκλείψις*; is shown to be equivalent to *δια τι ἔστιν ἐκλείψις*, and to have the same *μέσον*) *διὰ τι ἐκλείπει ἡ σελήνη*, is given as the equivalent of *διὰ τι ἔστιν ἐκλείψις*;

In l. 31 to the end of the chapter it seems doubtful whether, as I have taken the passage, Aristotle is saying that to know what a thing is is to know what causes it, equally as regards *S* *quia S* and *S* *quia P* (i.e. equally as regards the complete and the partial being of a substance), or equally as regards the being of *S* and the being of *P*.

The source of this obscurity is Aristotle's struggle—necessitated by his view of predication—to distinguish grammatical subject and predicate as substance and attribute, which consequently tend to become two kinds of thing. The same struggle is seen in the fluctuation of the meaning of *ὑποκειμενον*, which means now the complete substance, (a) as a totality of the elements constituting its definition and of its essential properties, (b) as a totality of its defining attributes only, now (c) a mere substratum which alone remains when you remove all its attributes from a substance.

¹ 'Middle': *μέσον* in this chapter is extended to mean 'proximate cause'; it is wider than the middle term of a syllogism. It is, or rather is reflected by, the middle term of a syllogism in the case of the definition of an attribute, because the definition of an attribute is a *λόγος* of it as inhering in the subject, and the middle term which proves, also causes, or reflects the cause of, this inherence, but the cause of a substance possessing unqualified being is not something other than itself, but its *λόγος*, its definition by genus and differentia, and this cannot be the middle term of a syllogism, because such definition is not demonstrable (cf. 11, ch. 4).

existence of the thing as respectively the partial and the unqualified being of the thing, I mean that if we ask 'does the moon suffer eclipse?', or 'does the moon wax?', the question concerns a part of the thing's being; for what we are asking in such questions is whether a thing is this or that, i.e. has or has not this or that attribute: whereas, if we ask whether the moon or night exists, the question concerns the unqualified being of a thing.)

We conclude that in all our inquiries we are asking either 5 whether there is a 'middle' or what the 'middle' is: for the 'middle' here is precisely the cause, and it is the cause that we seek in all our inquiries. Thus, 'Does the moon suffer eclipse?' means 'Is there or is there not a cause producing eclipse of the moon?', and when we have learnt that there is, our next question is, 'What, then, is this cause?'; for the cause through which a thing *is*—not *is this or that*, i.e. has this or that attribute, but without qualification *is*—and the 10 cause through which ¹ it is—not *is* without qualification, but *is this or that* as having some essential attribute or some accident—are both alike the 'middle'. By that which *is* without qualification I mean the subject, e.g. moon or earth or sun or triangle; by that which a subject *is* (in the partial sense) I mean a property, e.g. eclipse, equality or inequality, interposition or non-interposition. For in all these examples it is clear that the nature of the thing and the reason of the fact are identical: the question 'What is 15 eclipse?' and its answer 'The privation of the moon's light by the interposition of the earth' are identical with the question 'What is the reason of eclipse?' or 'Why does the moon suffer eclipse?' and the reply 'Because of the failure of light through the earth's shutting it out'. Again, for 'What is a concord? A commensurate numerical ratio of a high and ² a low note', we may substitute 'What reason makes a high and a low note concordant? Their relation 20 according to a commensurate numerical ratio.' 'Are the high and the low note concordant?' is equivalent to 'Is

¹ Reading τοῦ εἶναι for τὸ εἶναι with Bonitz in 90^a 9.

² Reading καὶ for ἢ with D in 90^a 19.

their ratio commensurate?'; and when we find that it is commensurate, we ask 'What, then, is their ratio?'.¹

Cases in which the 'middle' is sensible show that the
 25 object of our inquiry is always the 'middle': we inquire, because we have not perceived it, whether there is or is not a 'middle' causing e.g. an eclipse. On the other hand, if we were on the moon we should not be inquiring either as to the fact or the reason, but both fact and reason would be obvious simultaneously. For the act of perception would have enabled us to know the universal too; since, the present fact of an eclipse being evident, perception would then at the same time give us the present fact of the earth's
 30 screening the sun's light, and from this would arise the universal.

Thus, as we maintain, to know a thing's nature is to know the reason why it is; and this is equally true of things in so far as they are said without qualification to *be* as opposed to being possessed of some attribute, and in so far as they are said to be possessed of some attribute such as equal to two right angles, or greater or less.

35 It is clear, then, that all questions are a search for a 3 'middle'. Let us now state how essential nature is revealed, and in what way it can be reduced to demonstration;¹ what definition is, and what things are definable. And let us first discuss certain difficulties which these questions raise,
 90^b beginning what we have to say with a point most intimately connected with our immediately preceding remarks, namely the doubt that might be felt as to whether or not it is possible to know the same thing in the same relation, both by definition and by demonstration. It might, I mean, be urged that definition is held to concern essential nature and is in every case universal and affirmative; whereas, on the
 5 other hand, some conclusions are negative and some are not universal; e.g. all in the second figure are negative, none in the third are universal. And again, not even all affirmative conclusions in the first figure are definable, e.g. 'every triangle has its angles equal to two right angles'. An argument

¹ Cf. 94^a 11-14.

proving this difference between demonstration and definition is that to have scientific knowledge of the demonstrable¹ is identical with possessing a demonstration of it: hence if 10 demonstration of such conclusions as these is possible, there clearly cannot also be definition of them. If there could, one might know such a conclusion also in virtue of its definition without possessing the demonstration of it; for there is nothing to stop our having the one without the other.

Induction too will sufficiently convince us of this difference; for never yet by defining anything—essential attribute or 15 accident—did we get knowledge of it. Again, if to define is to acquire knowledge of a substance, at any rate such attributes are not substances.

It is evident, then, that not everything demonstrable can be defined. What then? Can everything definable be demonstrated, or not? There is one of our previous arguments which covers this too. Of a single thing *qua* 20 single there is a single scientific knowledge. Hence, since to know the demonstrable scientifically is to possess the demonstration of it, an impossible consequence will follow:—possession of its definition without its demonstration will give knowledge of the demonstrable.

Moreover, the basic premisses of demonstrations are definitions, and it has already been shown² that these will be found indemonstrable; either the basic premisses will be 25 demonstrable and will depend on prior premisses, and the regress will be endless; or the primary truths will be indemonstrable definitions.

But if the definable and the demonstrable are not wholly the same, may they yet be partially the same? Or is that impossible, because there can be no demonstration of the definable? There can be none, because definition is of the 30 essential nature or being of something, and all demonstrations evidently posit and assume the essential nature—mathematical demonstrations, for example, the nature of

¹ Reading ἀποδεικτόν with Waitz, who is confirmed by ἀποδεικτόν (A, B, and C) in * 21. A reads ἀποδεικτικόν, B, D, M, n, u ἀποδεικτικῶς.

² Cf. 72^b 18–25 and 84^a 30–b 2.

unity and the odd, and all the other sciences likewise. Moreover, every demonstration proves a predicate of a subject as attaching or as not attaching to it, but in definition one thing is not predicated of another; we do not,
 35 c. g., predicate animal of biped nor biped of animal, nor yet figure of plane—plane not being figure nor figure plane.¹ Again, to prove essential nature is not the same as to
 91^a prove the fact of a connexion. Now definition reveals essential nature, demonstration reveals that a given attribute attaches or does not attach to a given subject; but different things require different demonstrations²—unless the one demonstration is related to the other as part to whole. I add this because if all triangles have been proved to possess angles equal to two right angles, then this attribute has been proved to attach to isosceles; for isosceles is a part of
 5 which all triangles constitute the whole. But in the case before us the fact and the essential nature are not so related to one another, since the one is not a part of the other.

So it emerges that not all the definable is demonstrable nor all the demonstrable definable; and we may draw the general conclusion that there is no identical object of which it is possible to possess both a definition and a demonstration.
 10 It follows obviously that definition and demonstration are neither identical nor contained either within the other: if they were, their objects would be related either as identical or as whole and part.

So much, then, for the first stage of our problem. The 4 next step is to raise the question whether syllogism—i. e. demonstration—of the definable nature is possible or, as our recent argument assumed,³ impossible.

¹ *sc.* within the definitory λόγος. In the definition of *ἄνθρωπος*, ζῷον-δίπουν-λογικόν, the three 'moments' are severally and collectively predicable of *ἄνθρωπος*, but they are not, when considered as moments constituting the definition of *ἄνθρωπος*, predicable of each other.

² Aristotle argues that what definition reveals and what ordinary demonstration reveals are different. Therefore if definition is a kind of demonstration it is at any rate not the ordinary kind, and the 'definable' has not been shown to be the 'demonstrable' in the sense required.

³ Aristotle has been assuming that ἀπόδειξις is only of τὸ ὄν. Cf. e. g. 90^b 31-91^a 2.

We might argue it impossible on the following grounds:—
 (a) syllogism proves an attribute of a subject through the middle term; on the other hand (b) its definable nature is both ¹⁵ 'peculiar' ¹ to a subject and predicated of it as belonging to its essence. But in that case (1) the subject, its definition, and the middle term connecting them must be reciprocally predicable of one another; for if *A* is 'peculiar' to *C*, obviously *A* is 'peculiar' to *B* and *B* to *C*—in fact all three terms are 'peculiar' to one another: and further (2) if *A* inheres in the essence of all *B* and *B* is predicated universally of all *C* as belonging to *C*'s essence, *A* also must be predicated of *C* ²⁰ as belonging to its essence.

If one does not take this relation as thus duplicated—if, that is, *A* is predicated as being of the essence of *B*, but *B* is not of the essence of the subjects of which it is predicated—*A* will not necessarily be predicated of *C* as belonging to its essence. So both premisses *will* predicate essence, and consequently *B* also will be predicated of *C* as its essence. Since, therefore, both premisses do predicate ²⁵ essence—i. e. definable form—*C*'s definable form will appear in the middle term before the conclusion is drawn.

We may generalize by supposing that it is possible to prove the essential nature of man. Let *C* be man, *A* man's essential nature—two-footed animal, or aught else it may be. Then, if we are to syllogize, *A* must be predicated of all *B*. But this premiss will be mediated by a fresh definition, which consequently will also be the essential ³⁰ nature of man.² Therefore the argument assumes what it has to prove, since *B* too is the essential nature of man. It is, however, the case in which there are only the two premisses—i. e. in which the premisses are primary and immediate—which we ought to investigate, because it best illustrates the point under discussion.

Thus they who prove the essential nature of soul or man ³⁵

¹ *ἰδιον*, cf. note on 73^a 7.

² *sc.* 'and an indefinite regress occurs'. This argument is a corollary of the proof in 91^a 15–26 that if the proposition predicating *A*—its definition—of *C* can be a conclusion, there must be a middle term, *B*, and since *A*, *B*, and *C* are reciprocally predicable, *B* too, as well as *A*, will be a definition of *C*.

or anything else through reciprocating terms beg the question. It would be begging the question, for example, to contend that the soul is that which causes its own life, and that what causes its own life is a self-moving number; for one would have to postulate that the soul is a self-
 91^b moving number in the sense of being identical with it.¹ For if *A* is predicable as a mere consequent of *B* and *B* of *C*, *A* will not on that account be the definable form of *C*: *A* will merely be what ² it was true to say of *C*. Even if *A* is predicated of all *B* inasmuch as *B* is identical with a species of *A*, still it will not follow: being an animal is predicated
 5 of being a man—since it is true that in all instances to be human is to be animal, just as it is also true that every man is an animal—but not as identical with being man.³

We conclude, then, that unless one takes both the premisses as predicating essence, one cannot infer that *A* is the definable form and essence of *C*: but if one does so take them, in assuming *B* one will have assumed, before drawing the conclusion, what the definable form of *C* is; ⁴ so that
 10 there has been no inference, for one has begged the question.

Nor, as was said in my formal logic,⁵ is the method of 5 division a process of inference at all, since at no point does the characterization of the subject follow necessarily from the premising of certain other facts ⁶: division demonstrates
 15 as little as does induction. For in a genuine demonstration the conclusion must not be put as a question nor depend on a concession, but must follow necessarily from its premisses, even if the respondent deny it. The definer asks 'Is man animal or inanimate?' and then ⁷ assumes—he has not

¹ ὅπερ ἀριθμὸν εἶναι αὐτὸν αἰτὸν κινεῖσθαι alone would mean 'to be of the genus self-moving number'; as qualified by ὡς τὸ αὐτὸ ὂν it means 'fully identical with and completely definable as self-moving number'.

⁴ Bywater's οὐκ ἐστὶ τὸ τί ἦν εἶναι is easier.

⁵ Cf. *An. Pr.* i, ch. 31. ἐν τῇ ἀναλύσει τῇ περὶ τὰ σχήματα means literally 'in that part of the logical resolution of conclusions into their premisses which concerns the figures'.

⁶ A reminder of the definition of συλλογισμός, *An. Pr.* i, 24^b 18-20.

⁷ i.e. when the respondent has replied 'animal'.

inferred—that man is animal. Next, when presented with an exhaustive division of animal into terrestrial and aquatic, he assumes that man is terrestrial. Moreover, that man is ²⁰ the complete formula, terrestrial-animal, does not follow necessarily from the premisses: this too is an assumption, and equally an assumption whether the division comprises many differentiae or few. (Indeed as this method of division is used by those who proceed by it, even truths that can be inferred actually fail to appear as such.)¹ For why should not the whole of this formula be true of man, and yet not ²⁵ exhibit his essential nature or definable form? Again, what guarantee is there against an unessential addition, or against the omission of the final or of an intermediate determinant of the substantial being?

The champion of division might here urge that though these lapses do occur, yet we can solve that difficulty if all the attributes we assume are constituents of the definable form, and if, postulating the genus, we produce by division the requisite uninterrupted sequence of terms,² and omit nothing; and that indeed we cannot fail to fulfil these ³⁰ conditions if what is to be divided falls whole into the division at each stage, and none of it is omitted; and that this—the dividendum—must without further question be (ultimately) incapable of fresh specific division.³ Never-

¹ Treating ἀσυνλόγητος—συλλογισθῆναι in ^b 23 and 24 as a parenthesis.

² The terms of a series are ἐφεξῆς when nothing of the same kind as they intervenes between them, cf. *Phys.* vi. 231^b 23 and note on 95^b 4. The completed διαίρεσις of a γένος must present a set of terms such that between any two terms which are next to one another, either horizontally or vertically, no term of the same genus intervenes. Thus, if a γένος *A* is divided into *B* and *C*, *B* and *C* must be ἐφεξῆς: if *B* and *C* are divided respectively into *B*¹ *B*² and *C*¹ *C*², each of these pairs must be ἐφεξῆς and also the pairs *AB*, *BB*¹, *BB*², and *AC*, *CC*¹, *CC*², must each be ἐφεξῆς.

³ Omitting γὰρ and δεῖ in ^b 32 with A.: τοῦτο in ^b 32 refers to the subject of ἐμπίπτει in ^b 31. The divider is supposed to argue that if the process of division fulfils certain conditions—which, if at each stage it exhausts the dividendum, it cannot fail to do—then its final result must be an ἀτομον εἶδος—the essentially definable. In the next sentence Aristotle does not dispute that διαίρεσις may reach an ἀτομον εἶδος but denies that it does so by a process of inference. ἥδη in ^b 32 seems to mean ‘without more ado’, ‘without having any further condition to fulfil’: B εἶδη, Waitz εἶδει.

theless, we reply, division does not involve inference; if it gives knowledge, it gives it in another way. Nor is there any absurdity in this: induction, perhaps, is not demonstration any more than is division, yet it does make
 85 evident some truth. Yet to state a definition reached by division is not to state a conclusion: as, when conclusions are drawn without their appropriate middles, the alleged necessity by which the inference follows from the premisses is open to a question as to the reason for it, so definitions reached by division invite the same question. Thus to the
 92^a question 'What is the essential nature of man?' the divider replies 'Animal, mortal, footed, biped, wingless'; and when at each step he is asked 'Why?', he will say, and, as he thinks, prove by division, that all animal is mortal or immortal: but such a formula taken in its entirety is not definition; so that even if division does demonstrate its formula, definition at any rate does not turn out to be a
 5 conclusion of inference.

Can we nevertheless actually demonstrate what a thing 6 essentially and substantially is, but hypothetically, i. e. by premising (1) that its definable form is constituted by the 'peculiar'¹ attributes of its essential nature; (2) that such and such are the only attributes of its essential nature, and that the complete synthesis of them is peculiar to the thing; and thus—since in this synthesis consists the being of the thing—obtaining our conclusion? Or is the truth
 10 that, since proof must be through the middle term, the definable form is once more assumed in this minor premiss too?

Further, just as in syllogizing we do not premise what syllogistic inference is (since the premisses from which we conclude must be related as whole and part),² so the definable form must not fall within the syllogism but remain outside the premisses posited. It is only against a doubt
 15 as to its having been a syllogistic inference at all that we

¹ Cf. note on 73^a 7.

² A reminder of a necessary condition of syllogism. If the definition of syllogism is premised the conclusion would have to affirm some subject to be of the nature of syllogism.

have to defend our argument as conforming to the definition of syllogism. It is only when some one doubts whether the conclusion proved is the definable form that we have to defend it as conforming to the definition of definable form which we assumed. Hence syllogistic inference must be possible even without the express statement of what syllogism is or what definable form is.¹

The following type of hypothetical proof also begs the 20 question. If evil is definable as the divisible, and the definition of a thing's contrary—if it has one—is the contrary of the thing's definition; ² then, if good is the contrary of evil and the indivisible of the divisible, we conclude that to be good is essentially to be indivisible. The question is begged because definable form is assumed as a premiss, and as a premiss which is to prove definable form. 'But not the same definable form', you may object.³ That I admit, for 25 in demonstrations also we premise that 'this' is predicable of 'that';⁴ but in this premiss the term we assert of the minor is neither the major itself nor a term identical in definition, or convertible, with the major.

Again, both proof by division and the syllogism just described are open to the question why man should be animal-biped-terrestrial and not merely animal *and* terrestrial, since what they premise does not ensure that the 30 predicates shall constitute a genuine unity and not merely belong to a single subject as do musical and grammatical when predicated of the same man.

- 7 How then by definition shall we *prove* substance or essential nature? We cannot show it as a fresh fact 35 necessarily following from the assumption of premisses admitted to be facts—the method of demonstration: we may not proceed as by induction to establish a universal on the evidence of groups of particulars which offer no excep-

¹ Reading ἡ τὸ τί ἦν εἶναι with A.

² The full Greek would be εἰ τῷ κακῷ τὸ εἶναι ἐστὶ τὸ διαίρετόν εἶναι, τῷ δ' ἐναντίῳ τὸ εἶναι ἐστὶ τὸ τῷ ἐναντίῳ εἶναι. . . It would however be easier to read εἰ τὸ (so B and Waitz) κακῷ (sc. εἶναι) ἐστὶ τὸ διαίρετόν εἶναι, τὸ δ' ἐναντίῳ (sc. εἶναι) τὸ τῷ ἐναντίῳ εἶναι.

³ Placing a colon after μέντοι.

⁴ τόδε κατὰ τοῦδε=minor premiss.

tion, because induction proves not what the essential nature
 92^b of a thing is but that it has or has not some attribute.
 Therefore, since presumably one cannot prove essential
 nature by an appeal to sense perception¹ or by pointing
 with the finger, what other method remains?

To put it another way: how shall we by definition prove
essential nature? He who knows what human—or any other
 5 —nature is, must know also that man exists; for no one
 knows the nature of what does not exist—one can know
 the meaning of the phrase or name 'goat-stag' but not
 what the essential nature of a goat-stag is. But further, if
 definition can prove what is the essential nature of a thing,
 can it also prove that it exists? And how will it prove
 them both by the same process,² since definition exhibits one
 10 single thing and demonstration another single thing, and
 what human nature is and the fact that man exists are not
 the same thing? Then too we hold that it is by *demon-*
stration that the being of everything must be proved—
 unless indeed to be were its essence; and, since being is not
 a genus,³ it is not the essence of anything. Hence the being
 of anything as fact is matter for demonstration; and this
 15 is the actual procedure of the sciences, for the geometer
 assumes the meaning of the word triangle, but that it is
 possessed of some attribute⁴ he proves. What is it, then,
 that we shall prove in defining essential nature? Triangle?
 In that case a man will know by definition what a thing's
 nature is without knowing whether it exists. But that is
 impossible.

Moreover it is clear, if we consider the methods of de-
 fining actually in use, that definition does not prove that
 20 the thing defined exists: since even if there does actually

¹ Cf. for this use of αἰσθησις e.g. *Met.* 1025^b 11, 1064^a 8, *Rhet.* 1386^a 32 (best MSS.).

² Placing a comma after τί ἐστι and a note of interrogation after ὅτι ἐστι, and reading καὶ πῶς τῷ αὐτῷ λόγῳ with A and B. So Waitz.

³ Cf. *Met.* 998^b 22 ff. and 1045^b 6.

⁴ Triangle is for the geometer most naturally a subject and not an attribute: and in that case ὅτι δ' ἐστι should mean not 'that it exists', but 'that it has some attribute', e.g. equality to two right angles. It is tempting to read ἐστὶ τί.

Cf., however, note on 71^a 15, and it is possible that Aristotle is speaking loosely in this dialectical passage.

exist something¹ which is equidistant from a centre,² yet *why* should the thing named in the definition exist?³ Why, in other words, should this be the formula defining circle? One might equally well call it the definition of mountain copper. For definitions do not carry a further guarantee that the thing defined can exist or that it is what they claim to define: one can always ask why. 25

Since, therefore, to define is to prove either a thing's essential nature or the meaning of its name, we may conclude that definition, if it in no sense proves essential nature, is a set of words signifying precisely what a name signifies. But that were a strange consequence; for (1) both what is not substance and what does not exist at all would be definable, since even non-existents can be signified by a name: (2) all sets of words or sentences would be defini- 30
tions, since any kind of sentence could be given a name; so that we should all be talking in definitions, and even the *Iliad* would be a definition: (3) no demonstration⁴ can prove that any particular name means any particular thing:⁵ neither, therefore, do definitions, in addition to revealing the meaning of a name, also reveal that the name has *this* meaning. It appears then from these considerations that 35
neither definition and syllogism nor their objects are identical, and further that definition neither demonstrates nor proves anything, and that knowledge of essential nature is not to be obtained either by definition or by demonstration.

- 8 We must now start afresh and consider which of these 93^a
conclusions are sound and which are not, and what is the nature of definition, and whether essential nature is in any sense demonstrable and definable or in none.

Now to know its essential nature is, as we said,⁶ the same as to know the cause of a thing's existence, and the proof

¹ Reading $\tau\iota \text{ ἴσον}$ for $\tauὸ \text{ ἴσον}$, with A and D.

² An abbreviated definition of circle, cf. Euclid, *Elem.* i, Defs. xv and xvi.

³ Accenting ῆστι .

⁴ Omitting ἐπιστήμη with A, B, D, and supposing ἀπόδειξις to be understood.

⁵ *sc.* 'as on this assumption it would have to do'.

⁶ ii, ch. 2. In 93^a 4 read $\tauὸ \text{ εἰ ῆστι}$ with A, C, and B corr.

5 of this depends on the fact that a thing must have a cause. Moreover, this cause is either identical with the essential nature of the thing or distinct from it;¹ and if its cause is distinct from it, the essential nature of the thing is either demonstrable or indemonstrable. Consequently, if the cause is distinct from the thing's essential nature and demonstration is possible, the cause must be the middle term, and, the conclusion proved being universal and affirmative, the proof is in the first figure. So the method just examined of proving it through another essential nature
 10 would be one way of proving essential nature, because a conclusion containing essential nature must be inferred through a middle which is an essential nature just as a 'peculiar'.² property must be inferred through a middle which is a 'peculiar' property; so that of the two definable natures of a single thing this method will prove one and not the other.³

Now it was said before⁴ that this method could not amount to demonstration of essential nature—it is actually
 15 a dialectical proof of it—so let us begin again and explain by what method it can be demonstrated. When we are aware of a fact we seek its reason, and though sometimes the fact and the reason dawn on us simultaneously, yet we cannot apprehend the reason a moment sooner than the fact; and clearly in just the same way we cannot apprehend a thing's definable form without apprehending that it exists,
 20 since while we are ignorant whether it exists we cannot know its essential nature. Moreover we are aware whether a thing exists or not sometimes through apprehending an element in its character, and sometimes accidentally,⁵ as,

¹ 'distinct from it'; i.e. in the case of *properties*, with the definition of which Aristotle is alone concerned in this chapter. The being of a property consists in its inherence in a substance through a middle which defines it. Cf. the following chapter.

² Cf. note on 73^a 7.

³ ^a 12 τῶν τί ἢν εἶναι: Aristotle speaks of two moments of the definable form as two essential natures. His argument amounts to this: that if the conclusion contains the whole definition, the question has been begged in the premisses (cf. ii, ch. 4). Hence syllogism—and even so merely dialectical syllogism—is only possible if premisses and conclusion each contain a part of the definition.

⁴ ii, ch. 2.

⁵ The distinction is that between genuine knowledge of a connexion

for example, when we are aware of thunder as a noise in the clouds, of eclipse as a privation of light, or of man as some species of animal, or of the soul as a self-moving thing. As often as we have accidental knowledge that the thing exists, we must be in a wholly negative state²⁵ as regards awareness of its essential nature; for we have not got genuine knowledge even of its existence, and to search for a thing's essential nature when we are unaware that it exists is to search for nothing. On the other hand, whenever we apprehend an element in the thing's character there is less difficulty. Thus it follows that the degree of our knowledge of a thing's essential nature is determined by the sense in which we are aware that it exists. Let us then take the following as our first instance of being aware of an element in the essential nature. Let *A* be eclipse, *C*³⁰ the moon, *B* the earth's acting as a screen. Now to ask whether the moon is eclipsed or not is to ask whether or not *B* has occurred. But that is precisely the same as asking whether *A* has a defining condition;¹ and if this condition actually exists, we assert that *A* also actually exists. Or again we may ask which side of a contradiction the defining condition necessitates: does it make the angles of a triangle equal or not equal to two right angles? When we have found the answer, if the premisses are immediate,² we know fact and reason together; if they are not im-³⁵mediate, we know the fact without the reason, as in the following example: let *C* be the moon, *A* eclipse, *B* the fact that the moon fails to produce shadows³ though she is full and though no visible body intervenes between us and

through its cause and accidental knowledge of it through a middle not the cause.

¹ λόγος varies in meaning from mere 'statement' to 'the formula giving τὸ τί ἦν εἶναι of a substance', but always the underlying unity of its meanings is the rationality, the intelligible connexion, which discourse—verbal or held by the soul with herself—exhibits in varying degrees. Here it is equivalent to 'proximate cause'. The fact that λόγος also means 'definition' assists Aristotle to identify cause and definition. 'Defining condition' perhaps to some degree covers the two senses.

² Reading δι' ἀμέσων with Waitz.

³ i.e. that there is no moonlight casting shadows on the earth on a clear night at full moon.

her. Then if *B*, failure to produce shadows in spite of the
 93^b absence of an intervening body, is attributable to *C*, and *A*,
 eclipse, is attributable to *B*, it is clear that the moon is
 eclipsed, but the reason why is not yet clear, and we know
 that eclipse exists, but we do not know what its essential
 nature is. But when it is clear that *A* is attributable to
C and we proceed to ask the reason of this fact, we are
 5 inquiring what is the nature of *B*: is it the earth's acting
 as a screen, or the moon's rotation or her extinction? But
B is the definition of the other term, viz., in these examples,
 of the major term *A*; for eclipse is constituted by the earth
 acting as a screen. Thus, (1) 'What is thunder?' 'The
 quenching of fire in cloud', and (2) 'Why does it thunder?'
 'Because fire is quenched in the cloud', are equivalent.
 10 Let *C* be cloud, *A* thunder, *B* the quenching of fire. Then
B is attributable to *C*, cloud, since fire is quenched in it;
 and *A*, noise, is attributable to *B*; and *B* is assuredly the
 definition of the major term *A*. If there be a further
 mediating cause of *B*, it will be one of the remaining
 partial definitions of *A*.

15 We have stated then how essential nature is discovered
 and becomes known, and we see that, while there is no
 syllogism—i. e. no demonstrative syllogism—of essential
 nature, yet it is through syllogism, viz. demonstrative syl-
 logism, that essential nature is exhibited. So we conclude
 that neither can the essential nature of anything which has
 a cause distinct from itself be known without demonstra-
 tion, nor can it be demonstrated; and this is what we
 20 contended in our preliminary discussions.¹

Now while some things have a cause distinct from them- 9
 selves, others have not. Hence it is evident that there are
 essential natures which are immediate, that is are basic
 premisses; and of these not only *that* they are but also
what they are must be assumed or revealed in some other
 way. This too is the actual procedure of the arithmetician,
 25 who assumes both the nature and the existence of unit. On
 the other hand, it is possible (in the manner explained) to

¹ ii, ch. 3.

exhibit through demonstration the essential nature of things which have a 'middle',¹ i.e. a cause of their substantial being other than that being itself; but we do not thereby demonstrate it.

- 10 Since definition is said to be the statement of a thing's nature, obviously one kind of definition will be a statement of the meaning of the name, or of an equivalent nominal 30 formula. A definition in this sense tells you, e.g., the meaning of the phrase 'triangular character'.² When we are aware that triangle exists, we inquire the reason why it exists. But it is difficult thus to learn the definition of things the existence of which we do not genuinely know—the cause of this difficulty being, as we said before,³ that we only know accidentally whether or not the thing exists. 35 Moreover, a statement may be a unity in either of two ways, by conjunction, like the *Iliad*, or because it exhibits a single predicate as inhering not accidentally in a single subject.⁴

That then is one way of defining definition. Another kind of definition is a formula exhibiting the cause of a thing's existence. Thus the former signifies without proving, but 94^a the latter will clearly be a *quasi*-demonstration of essential nature, differing from demonstration in the arrangement of its terms. For there is a difference between stating why it thunders, and stating what is the essential nature of thunder; since the first statement will be 'Because fire is quenched in the clouds', while the statement of what the nature of thunder is will be 'The noise of fire being quenched in the clouds'. Thus the same statement takes 5 a different form: in one form it is continuous⁵ demonstration, in the other definition. Again, thunder can be defined

¹ Cf., however, ii, ch. 2, and note on 89^b 38. Aristotle here uses μέσος in the more restricted sense.

² i.e. as treated by geometry; that is, as abstracted *a materia* and treated as a subject. Cf. 81^b 25.

³ Cf. 93^a 16–27.

⁴ Presumably a reason for there being a kind of definition other than nominal. The reference is obviously to 92^b 32.

⁵ Demonstration, like a line, is continuous because its premisses are parts which are conterminous (as linked by middle terms), and there is a movement from premisses to conclusion. Definition resembles rather the indivisible simplicity of a point.

as noise in the clouds, which is the conclusion of the demonstration embodying essential nature. On the other hand the definition of immediates is an indemonstrable
 10 positing of essential nature.

We conclude then that definition is (a) an indemonstrable statement of essential nature, or (b) a syllogism of essential nature differing from demonstration in grammatical form, or (c) the conclusion of a demonstration giving essential nature.

Our discussion has therefore made plain (1) in what sense and of what things the essential nature is demon-
 15 strable, and in what sense and of what things it is not; (2) what are the various meanings of the term definition, and in what sense and of what things it proves the essential nature, and in what sense and of what things it does not; (3) what is the relation of definition to demonstration, and how far the same thing is both definable and demonstrable and how far it is not.

20 We think we have scientific knowledge when we know II the cause, and there are four causes: (1) the definable form, (2) an antecedent which necessitates a consequent,¹ (3) the

¹ By this Aristotle appears to mean the material cause; cf. *Physics* ii, 193^a 18, 19, where the premisses of a syllogism are said to be the material cause of the conclusion. In this chapter Aristotle gives no separate example of formal cause as the middle term of demonstration, and seems rather, in virtue of a different classification of cause, to regard the middle of demonstration as *always* a formal cause because it defines the major term, and as generically embracing material, efficient, and final causes. But as the transition is neither explicit nor complete, this is confusing. In the *Metaphysics* Aristotle teaches that formal, final, and efficient causes coalesce (cf. e.g. *Met.* 1044^b 1, 1070^b 26), while the material cause remains distinct. The treatment of causation here is presumably earlier than the teaching of the *Metaphysics*, though in the last part of the chapter Aristotle is moving towards the position he there adopts. Possibly he felt that if the middle of ἀπόδειξις must reflect the full proximate cause of a connexion, then the four causes could not remain wholly distinct from one another, and hence his attempt here to unite them under the formal cause. He may subsequently have been induced to omit the material cause from this unification from a consideration of the unknowable and merely potential nature of ὕλη. Even here the example he gives of a material cause is not what one expects, i.e. not one such as, e.g., bricks taken as the material cause of a house. Aristotle's difficulty is due to the fact that he is trying to equate scientific conceptions of causation, which he should have recognized as *πρῶται ἀρχαί*, or at least as axioms not translatable without modification from spheres which they were formulated

efficient cause,¹ (4) the final cause. Hence each of these can be the middle term of a proof, for² (a) though the inference from antecedent to necessary consequent does not hold if only one premiss is assumed—two is the minimum²⁵—still when there are two it holds on condition that they have a single common middle term. So it is from the assumption of this single middle term that the conclusion follows necessarily. The following example will also show this.³ Why is the angle in a semicircle a right angle?—or from what assumption does it follow that it is a right angle? Thus, let *A* be right angle, *B* the half of two right angles, *C* the angle in a semicircle. Then *B* is the cause in virtue³⁰ of which *A*, right angle, is attributable to *C*, the angle in a semicircle, since $B=A$ and the other, viz. $C=B$, for *C* is half of two right angles. Therefore it is the assumption of *B*, the half of two right angles, from which it follows that *A* is attributable to *C*, i. e. that the angle in a semicircle is a right angle. Moreover, *B* is identical with (b) the defining form of *A*, since it is what *A*'s definition⁴ signifies. Moreover, the formal cause has already been shown to be the middle.⁵ (c) 'Why did the Athenians become involved in the Persian war?' means 'What cause originated the waging of war against the Athenians?' and the answer is, 'Because they raided Sardis with the Eretrians', since^{94^b} this originated the war. Let *A* be war, *B* unprovoked raiding, *C* the Athenians. Then *B*, unprovoked raiding, is true of *C*, the Athenians, and *A* is true of *B*, since men make war on the unjust aggressor. So *A*, having war⁵ waged upon them, is true of *B*, the initial aggressors, and

to explain, with the logical category of ground and consequent, which for him takes the narrowly specialized form of inherence of attribute in subject. Two thousand years later Leibniz was still making the same attempt.

¹ ἡ τὴν πρῶτον should be thus accented.

² sc. 'lest you should suppose that (2) could not be a middle'.

³ sc. 'that (2) can appear as a middle'.

⁴ Cf. Euclid, *Elem.* i, Def. x, but Aristotle may be referring to some earlier definition. The proof here given that the angle in a semicircle is a right angle is not that of Euclid iii. 31; cf. Heath, *Greek Mathematics*, i. pp. 339, 340.

⁵ The reference is to 93^a 3 ff., and other passages such as 94^a 5 ff., where the middle is shown to define the major.

B is true of *C*, the Athenians, who were the aggressors. Hence here too the cause—in this case the efficient cause—is the middle term. (*d*) This is no less true where the cause is the final cause. E.g. why does one take a walk after supper? For the sake of one's health. Why does a house
 10 exist? For the preservation of one's goods. The end in view is in the one case health, in the other preservation. To ask the reason why one must walk after supper is precisely to ask to what end one must do it. Let *C* be walking after supper, *B* the non-regurgitation of food, *A* health. Then let walking after supper possess the property of preventing
 15 food from rising to the orifice of the stomach, and let this condition be healthy; since it seems that *B*, the non-regurgitation of food, is attributable to *C*, taking a walk, and that *A*, health, is attributable to *B*. What, then, is the cause through which *A*, the final cause, inheres in *C*? It is *B*, the non-regurgitation of food; but *B* is a kind of definition
 20 of *A*, for *A* will be explained by it. Why is *B* the cause of *A*'s belonging to *C*? Because to be in a condition such as *B* is to be in health. The definitions must be transposed, and then the detail will become clearer.¹ Incidentally, here the order of coming to be is the reverse of what it is in proof through the efficient cause: in the efficient order the middle term must come to be first, whereas in the teleo-
 25 logical order the minor, *C*, must first take place, and the end in view comes last in time.²

¹ The argument from 94^b 8 is roughly as follows:—

Health *A*, digestion *B*, walking *C*.

The final cause *A* inheres in *C* through the efficient cause *B*. (*A-B*, *B-C*, ∴ *A-C*.)

⟨But the final cause naturally appears as the effect of the efficient cause; which means that⟩ *B*, the efficient cause, is a kind of definition of *A*, the final cause.

⟨Since *A* is *B*'s final cause, just as much as *B* is *A*'s efficient cause. *A* is also a kind of definition of *B*. Hence⟩ we can transpose *A* and *B*, and prove the inherence of *B* in *C* through *A*. (*B-A*, *A-C*, ∴ *B-C*.)

This seems to foreshadow the doctrine of the ultimate identity of final, efficient, and formal cause, cf. note on 94^a 22.

² The actual γένεσις or order of events is walking—digestion—health. The terms of the syllogism through the efficient cause reflect

$$\begin{array}{ccccc} & C & B & A & \\ & \text{minor} & \text{middle} & \text{major} & \end{array}$$

these stages as follows: minor—middle—major. In the syllogism through

$$\begin{array}{ccccc} & C & B & A & \\ & \text{final cause} & \text{efficient cause} & \text{formal cause} & \end{array}$$
 final cause they appear as minor—major—middle. Aristotle should,

The same thing may exist for an end and be necessitated as well. For example, light shines through a lantern (1) because that which consists of relatively small particles necessarily passes through pores larger than those particles—assuming that light does issue by penetration—and (2) for 30 an end, namely to save us from stumbling. If, then, a thing can exist through two causes, can it come to be through two causes—as for instance if thunder be a hiss and a roar necessarily produced by the quenching of fire, and also designed, as the Pythagoreans say, for a threat to terrify those that lie in Tartarus? ¹ Indeed, there are very many such cases, mostly among the processes and products 35 of the natural world; ² for nature, in different senses of the term 'nature', produces now for an end, now by necessity.

Necessity too is of two kinds. It may work in accordance with a thing's natural tendency, or by constraint and in 95^a opposition to it; as, for instance, by necessity a stone is borne both upwards and downwards, but not by the same necessity.

Of the products of man's intelligence some are never due to chance or necessity but always to an end, as for example a house or a statue; others, such as health or safety, may 5 result from chance as well.

It is mostly in cases where the issue is indeterminate (though only where the production does not originate in

however, have said of the middle in the efficient order not *δεῖ γένεσθαι πρῶτον*, but that it must come to be before the major.

But possibly *ἐκεῖ* in ^b24 = 'in the teleological order', *ἐνταῦθα*, ^b25, 'in the efficient order', and Aristotle is comparing the order of steps in a *βούλευσις* (an *ἀνάλυσις* of an end into its means, cf. e.g. *E. N.* 1112^b 11–24) with the actual order of events reflected by the syllogism through the efficient cause. In this case he naturally says that in the teleological order the middle—health, the end in view—is conceived first (cf. *E. N.* loc. cit.). The objection to this second view is that Aristotle is unlikely to speak of *ἀνάλυσις* as a *γένεσις*: in the passage quoted from *E. N.* he contrasts *ἀνάλυσις* and *γένεσις*.

¹ Placing a comma after *ἐνδέχεται* in ^b32 and a note of interrogation after *φοβῶνται* in ^b34. —

² *συνισταμένοις*: probably the natural processes by which e.g. *ὁμοιομερῆ* are formed from *στοιχεῖα*. This is an instance of dual causation in *γίγνεσθαι*, cf. 94^b 31. *συνεστῶσιν*: probably natural products *φύα* maintaining themselves in being (e.g. plants and animals)—an instance of dual causation in *εἶναι*, cf. *ibid.*

chance, and the end is consequently good),¹ that a result is due to an end, and this is true alike in nature or in art. By chance, on the other hand, nothing comes to be for an end.

- 10 The effect may be still coming to be, or its occurrence may be past or future, yet the cause will be the same as when it is actually existent—for it is the middle which is the cause²—except that if the effect actually exists the cause is actually existent, if it is coming to be so is the cause, if its occurrence is past the cause is past, if future the cause is future. For example, the moon was eclipsed because the earth intervened, is becoming eclipsed because the earth is
15 in process of intervening, will be eclipsed because the earth will intervene, is eclipsed because the earth intervenes.

To take a second example: assuming that the definition of ice is solidified water, let *C* be water, *A* solidified, *B* the middle, which is the cause, namely total failure of heat. Then *B* is attributed to *C*, and *A*, solidification, to *B*: ice
20 forms when *B* is occurring, has formed when *B* has occurred, and will form when *B* shall occur.

This sort of cause, then, and its effect come to be simultaneously when they are in process of becoming, and exist simultaneously when they actually exist; and the same holds good when they are past and when they are future. But what of cases where they are not simultaneous? Can causes and effects different from one another form, as they seem
25 to us to form, a continuous succession, a past effect resulting from a past cause different from itself, a future effect from a future cause different from it, and an effect which is coming-to-be from a cause different from and prior to it? Now on this theory it is from the posterior event that we reason (and this though these later events actually have their source of origin in previous events—a fact which shows that also when the effect is coming-to-be we still reason from the posterior event), and from the prior event we cannot reason

¹ Bracketing 95^a 7 ὅταν . . . * 8 ἀγαθόν and reading a comma after ἡ in * 7. 'The end is consequently good'—i.e. a genuine end.

² Bracketing τὸ γὰρ μέσον αἰτίον and following it with a colon. Aristotle means that he is here only dealing with causes which can be middle terms of demonstration, i.e. which reciprocate with their effects.

(we cannot argue that because an event *A* has occurred, 30 therefore an event *B* has occurred subsequently to *A* but still in the past—and the same holds good if the occurrence is future)¹—cannot reason because, be the time interval definite or indefinite, it will never be possible to infer that because it is true to say that *A* occurred, therefore it is true to say that *B*, the subsequent event, occurred; for in the interval between the events, though *A* has already occurred, 35 the latter statement will be false. And the same argument applies also to future events;² i.e. one cannot infer from an event which occurred in the past that a future event will occur. The reason of this is that the middle must be homogeneous, past when the extremes are past, future when they are future, coming to be when they are coming-to-be, actually existent when they are actually existent; and there cannot be a middle term homogeneous with extremes respectively past and future. And it is a further difficulty 40 in this theory that the time interval can be neither indefinite nor definite, since during it the inference will be false.³ We 95^b have also to inquire what it is that holds events together so that the coming-to-be now occurring in actual things follows upon a past event. It is evident, we may suggest, that a past event and a present process cannot be 'contiguous';⁴

¹ Treating as parentheses ^a 28 ἀρχὴ δὲ . . . ^a 29 ὡσαύτως and ^a 30 οἶον . . . ^a 31 ὡσαύτως.

² Placing a comma after ἐσομένον in ^a 36.

³ i.e. a further difficulty created by taking cause and effect as 'punctual' events is that, since time is continuous and not composed of atomic 'nows', there must be a time interval between any two such 'punctual' events. But during this interval the inference must be false, because the causal nexus cannot leap the gap nor, *ex hypothesi*, persist through it. In fact such an account of cause and effect does not correspond to the real connexions in things. Cf. e.g. *Physics* vi.

⁴ Terms are ἐφεξῆς, 'successive', if they are next one another and nothing of the same kind intervenes. Terms are ἐχόμενα, 'contiguous', if they are ἐφεξῆς and also in contact; e.g. boats at the start of a bumping race are ἐφεξῆς; houses in a row of houses any and every pair of which share a party-wall are ἐχόμενα. If the members of any series are conterminous—i.e. if any point at which you divide the series is a term of the series—they are συνεχῆ or 'continuous'. Cf. *Met.* 1068^b 30 ff.

Aristotle asks whether it is possible, while regarding time as continuous, yet to suppose that within any duration, past or future, two disjunct or 'punctual' events can be connected as cause and effect; and further whether an event now occurring, not itself 'punctual' but a specious present, can have as its cause a 'punctual' past event.

for not even two past events can be 'contiguous'. For past
 5 events are limits and atomic; so just as points are not
 'contiguous' neither are past events, since both are indi-
 visible. For the same reason a past event and a present
 process cannot be 'contiguous', for the process is divisible,
 the event indivisible. Thus the relation of present process
 to past event is analogous to that of line to point, since a
 10 process contains an infinity of past events. These questions,
 however, must receive a more explicit treatment in our
 general theory of change.¹

The following must suffice as an account of the manner
 in which the middle would be identical with the cause on
 the supposition that coming-to-be is a series of consecutive
 events: for² in the terms of such a series too the middle
 15 and major terms must form an immediate premiss; e.g.
 we argue that, since *C* has occurred, therefore *A* occurred:
 and *C*'s occurrence was posterior, *A*'s prior; but *C* is the
 source of the inference because it is nearer to the present
 moment, and the starting-point of time is the present. We
 next argue that, since *D* has occurred, therefore *C* occurred.
 Then we conclude that, since *D* has occurred, therefore *A*
 20 must have occurred; and the cause is *C*, for since *D* has
 occurred *C* must have occurred, and since *C* has occurred *A*
 must previously have occurred.

If we get our middle term in this way, will the series
 terminate in an immediate premiss, or since, as we said, no
 two events are 'contiguous', will a fresh middle term always
 intervene because there is an infinity of middles? No:
 though no two events are 'contiguous', yet we must start
 from a premiss consisting of a middle and the present event
 25 as major.³ The like is true of future events too, since if it

¹ Cf. *Physics* vi.

² i.e. Aristotle has had in this chapter to explain (1) how syllogisms concerning a process of events can be brought into line with other demonstrations equally derivable from immediate primary premisses, and (2) in what sense the middle term contains the cause. He has in fact had (1) to show that in these syllogisms inference must find its primary premiss in the effect, and (2) to imply that the 'cause' which appears as middle when cause and effect are not simultaneous is a *causa cognoscendi* and not *essendi*.

³ Waitz reads ἀπ' αὐτίκων in ^b 25 for ἀπὸ μέσων (D ἀπὸ τοῦ μέσων): 'from

is true to say that *D* will exist, it must be a prior truth to say that *A* will exist, and the cause of this conclusion is *C*; for if *D* will exist, *C* will exist prior to *D*, and if *C* will exist, *A* will exist prior to it. And here too the same infinite divisibility might be urged, since future events are not 'contiguous'. But here too an immediate basic premiss must be assumed. And in the world of fact this is so: if a house has been built, then blocks must have been quarried and shaped. The reason is that a house having been built necessitates a foundation having been laid, and if a foundation has been laid blocks must have been shaped beforehand. Again, if a house will be built, blocks will similarly be shaped beforehand; and proof is through the middle in the same way, for the foundation will exist before the house.

Now we observe in Nature a certain kind of circular process of coming-to-be; and this is possible only if the middle and extreme terms¹ are reciprocal, since conversion is conditioned by reciprocity in the terms of the proof. This—the convertibility of conclusions and premisses—has been proved in our early chapters,² and the circular process is an instance of this. In actual fact it is exemplified thus: when the earth had been moistened an exhalation was bound to rise, and when an exhalation had risen cloud was bound to form, and from the formation of cloud rain necessarily resulted, and by the fall of rain the earth was necessarily moistened: but this was the starting-point, so that a circle is completed; for posit any one of the terms and another follows from it, and from that another, and from that again the first.

Some occurrences are universal (for they are, or come-to-be what they are, always and in every case); others again are not always what they are but only as a general rule: for instance, not every man can grow a beard, but it is the general rule. In the case of such connexions the middle term too must be a general rule. For if *A* is predicated

an immediate premiss, i.e. the primary "now"; but *πρῶτον* is used in ^b 15 as = 'major term'.

¹ We should perhaps read *ἄρα* with A and Waitz; but the sense is the same.

² I, ch. 3 and *An. Pr.* ii, cc. 3-5, 8-10.

universally of *B* and *B* of *C*, *A* too must be predicated always and in every instance of *C*, since to hold in every
 15 instance and always is of the nature of the universal. But we have assumed a connexion which is a general rule; consequently the middle term *B* must also be a general rule. So connexions which embody a general rule—i.e. which exist or come to be as a general rule—will also derive from immediate basic premisses.

20 We have already explained how essential nature is set out in the terms of a demonstration, and the sense in which it is or is not demonstrable or definable; so let us now discuss the method to be adopted in tracing the elements predicated as constituting the definable form.

Now of the attributes which inhere always in each several thing there are some which are wider in extent than it but
 25 not wider than its genus (by attributes of wider extent I mean all such as are universal attributes of each several subject, but in their application are not confined to that subject).² I.e. while an attribute may inhere in every triad, yet also in a subject not a triad—as being inheres in triad but also in subjects not numbers at all—odd on the other hand is an attribute inhering in every triad and of wider
 30 application (inhering as it does also in pentad),³ but which does not extend beyond the genus of triad; for pentad is a number, but nothing outside number is odd. It is such attributes which we have to select, up to the exact point at which they are severally of wider extent than the subject but collectively coextensive with it; for this synthesis must be the substance of the thing. For example every
 35 triad possesses the attributes number, odd, and prime in both senses, i.e. not only as possessing no divisors, but also as not being a sum of numbers. This, then, is precisely what triad is, viz. a number, odd, and prime in the former and also the latter sense of the term: for these attributes taken severally

¹ This chapter treats only the definition of substances.

² Bracketing λέγω l. 25 . . . ἀλλὰ l. 27, and following the bracket with a comma.

³ Bracketing καὶ . . . ὑπάρχει l. 30, and following the bracket with a comma.

apply, the first two to all odd numbers, the last to the dyad 96^b also as well as to the triad, but, taken collectively, to no other subject. Now since we have shown above¹ that attributes predicated as belonging to the essential nature are necessary and that universals are necessary, and since the attributes which we select as inhering in triad, or in any other subject whose attributes we select in this way, are predicated as belonging to its essential nature, triad will thus possess these 5 attributes necessarily. Further, that the synthesis of them constitutes the substance of triad is shown by the following argument. If it is not identical with the being of triad, it must be related to triad as a genus named or nameless. It will then be of wider extent than triad—assuming that wider potential extent is the character of a genus. If on the other hand 10 this synthesis is applicable to no subject other than the individual triads, it will be identical with the being of triad, because we make the further assumption that the substance of each subject is the predication of elements in its essential nature down to the last differentia characterizing the individuals. It follows that any other synthesis thus exhibited will likewise be identical with the being of the subject.

The author of a hand-book² on a subject that is a generic 15 whole should divide the genus into its first *infimae species*—number e.g. into triad and dyad—and then endeavour to seize their definitions by the method we have described—the definition, for example, of straight line or circle or right angle. After that, having established what the category is to which the subaltern genus belongs—quantity or quality, for instance—he should examine the properties ‘peculiar’³ 20 to the species, working through the proximate⁴ common differentiae. He should proceed thus because the attributes of the genera compounded of the *infimae species* will be clearly given by the definitions of the species; since the basic element of them all⁵ is the definition, i.e. the simple

¹ i, ch. 4.

² With the remainder of the chapter compare *An. Pr.* i, ch. 25, where the treatment covers all syllogism.

³ *vide* note on 73^a 7.

⁴ *πρώτων* appears to mean ‘first in a scale ascending towards the genus’.

⁵ *sc.* genera and species.

infima species,¹ and the attributes inhere essentially in the simple *infimae species*, in the genera only in virtue of these.

- 25 Divisions according to differentiae are a useful accessory to this method. What force they have as proofs we did, indeed, explain above,² but that merely towards collecting the essential nature they may be of use we will proceed to show. They might, indeed, seem to be of no use at all, but rather to assume everything at the start and to be no better
30 than an initial assumption made without division. But, in fact, the order in which the attributes are predicated does make a difference—it matters whether we say animal—tame—biped, or biped—animal—tame. For if every definable thing consists of two elements and ‘animal-tame’ forms a unity, and again out of this and the further differentia man (or whatever else is the unity under construction) is constituted, then the elements we assume have necessarily been reached
35 by division. Again, division is the only possible method of avoiding the omission of any element of the essential nature. Thus, if the primary genus is assumed and we then take one of the lower divisions, the dividendum will not fall whole into this division: e.g. it is not all animal which is either whole-winged or split-winged but all winged animal,
97^a for it is winged animal to which this differentiation³ belongs. The primary differentiation of animal is that within which all animal falls. The like is true of every other genus, whether outside animal or a subaltern genus of animal; e.g. the primary differentiation of bird is that within which falls every bird, of fish that within which falls every fish. So, if we proceed in this way, we can be sure that nothing
5 has been omitted: by any other method one is bound to omit something without knowing it.

¹ τὸν ὀρισμὸν καὶ τὸ ἀπλοῦν: i.e. the *infima species*, which is ‘simple’ because below it are only ἀδιάφορα, and which is the essentially definable.

² ii, ch. 5 and *An. Pr.* i, ch. 31, where διαίρεσις is shown not to be inference.

³ Aristotle tends to use διαφορά and διαίρεσις indifferently in this chapter. This is natural, since a subject which obtains its διαφορά by falling on one side of a διαίρεσις is *ipso facto* qualified by its distinction from the other side.

To define and divide one need not know the whole of existence. Yet some hold it impossible to know the differentiae distinguishing each thing from every single other thing without knowing every single other thing; and one cannot, they say, know each thing without knowing its differentiae, since everything is identical with that from ¹⁰ which it does not differ, and other than that from which it differs. Now first of all this is a fallacy: not every differentia precludes identity, since many differentiae inhere in things specifically identical, though not in the substance of these nor essentially. Secondly, when one has taken one's differing pair of opposites and assumed that the two sides exhaust the genus, and that the subject one seeks to define ¹⁵ is present in one or other of them, and one has further verified its presence in one of them; then it does not matter whether or not one knows all the other subjects of which the differentiae are also predicated. For it is obvious that when by this process one reaches subjects incapable of further differentiation one will possess the formula defining the substance. Moreover, to postulate that the division exhausts the genus is not illegitimate if the opposites exclude a middle; ²⁰ since if it is the differentia of that genus, anything contained in the genus must lie on one of the two sides.

In establishing a definition by division one should keep three objects in view: (1) the admission only of elements in the definable form, (2) the arrangement of these in the right order, (3) the omission of no such elements. The first is ²⁵ feasible because one can establish genus and differentia through the topic of the genus,¹ just as one can conclude the inherence of an accident through the topic of the accident.² The right order will be achieved if the right term is assumed as primary, and this will be ensured if the term selected is predicable of all the others but not all they of it; since ³⁰ there must be one such term. Having assumed this we at once proceed in the same way with the lower terms; for our second term will be the first of the remainder, our third the first of those which follow the second in a 'contiguous'³ series, since when the higher term is excluded, that term of

¹ Cf. *Topics* iv.² Cf. *Topics* ii.³ Cf. note on 95^b 4.

the remainder which is 'contiguous' to it will be primary, and so on. Our procedure makes it clear that no elements
 35 in the definable form have been omitted: we have taken the differentia that comes first in the order of division, pointing out that animal, e.g., is divisible exhaustively into *A* and *B*, and that the subject accepts one of the two as its predicate. Next we have taken the differentia of the whole thus reached, and shown that the whole we finally reach is not further divisible—i.e. that as soon as we have taken the last differentia to form the concrete totality, this totality admits
 97^b of no division into species. For it is clear that there is no superfluous addition, since all these terms we have selected are elements in the definable form; and nothing lacking, since any omission would have to be a genus or a differentia. Now the primary term is a genus, and this term taken in conjunction with its differentiae is a genus: moreover the differentiae are all included, because there is now no further
 5 differentia; if there were, the final concrete would admit of division into species, which, we said, is not the case.

To resume our account of the right method of investigation:¹ We must start by observing a set of similar—i. e. specifically identical—individuals, and consider what element they have in common. We must then apply the same process to another set of individuals which belong to one species² and are generically but not specifically identical with the former
 10 set. When we have established what³ the common element is in all members of this second species, and likewise in members of further species, we should again consider whether the results established possess any identity, and persevere until we reach a single formula, since this will be the definition of the thing. But if we reach not one formula but two or more, evidently the *definiendum* cannot be one thing but
 15 must be more than one. I may illustrate my meaning as follows. If we were inquiring what the essential nature of pride is, we should examine instances of proud men we know of to see what, as such, they have in common; e. g.

¹ Aristotle resumes the discussion broken in 96^b 25 by the digression on *διαίρεσις* and deals with the question of defining a *γένος*.

² Reading *αἰοῖς* with A (?).

³ Reading *τί πάντα*.

if Alcibiades was proud, or Achilles and Ajax were proud, we should find, on inquiring what they all had in common, that it was intolerance of insult; it was this which drove Alcibiades to war, Achilles to wrath, and Ajax to suicide. 10 We should next examine other cases, Lysander, for example, or Socrates, and then if these have in common indifference alike to good and ill fortune, I take these two results and inquire what common element have equanimity amid the vicissitudes of life and impatience of dishonour. If they have none, there will be two genera¹ of pride. Besides, every 25 definition is always universal and commensurate:² the physician does not prescribe what is healthy for a single eye, but for all eyes or for a determinate species of eye. It is also easier by this method to define the single species than the universal, and that is why our procedure should be from the several species to the universal genera—this for the further reason too that equivocation is less readily 30 detected in genera than in *infimae species*. Indeed, perspicuity is essential in definitions, just as inferential movement³ is the minimum required in demonstrations; and we shall attain perspicuity if we can collect separately the definition of each species⁴ through the group of singulars which we have established⁵—e.g. the definition of similarity not unqualified but restricted to colours and to figures; 35 the definition of acuteness, but only of sound—and so proceed to the common universal with a careful avoidance of equivocation. We may add that if dialectical disputation must not employ metaphors, clearly metaphors and metaphorical expressions are precluded in definition: otherwise dialectic would involve metaphors.⁶

14 In order to formulate the connexions we wish to prove 98^a

¹ εἶδη here must mean γένη, an apparent reversion to Plato's indiscriminate use of the terms, and contrary to Aristotle's general usage elsewhere.

² This sentence explains why the absence of a common element means that there are two genera: a definition, being commensurate, cannot embrace subjects with nothing in common.

³ Reading συλλελογίσθαι, with B and Waitz.

⁴ γένη here must be equivalent to εἶδη, cf. note on 97^b 25.

⁵ Reading εἰλημμένων for εἰρημμένων; cf. 97^b 12.

⁶ sc. as sometimes involving definition.

we have to select our analyses and divisions.¹ The method of selection consists in laying down the common genus of all our subjects of investigation—if e.g. they are animals, we lay down what the properties are which inhere in every animal. These established, we next lay down the properties
 5 essentially connected with the first of the remaining classes²—e.g. if this first subgenus is bird, the essential properties of every bird—and so on, always characterizing the proximate subgenus.³ This will clearly at once enable us to say in virtue of what character⁴ the subgenera—man, e.g., or horse—possess their properties. Let *A* be animal,
 10 *B* the properties of every animal, *C D E* various species of animal. Then it is clear in virtue of what character *B* inheres in *D*—namely *A*—and that it inheres in *C* and *E* for the same reason: and throughout the remaining subgenera always the same rule applies.

We are now taking our examples from the traditional class-names, but we must not confine ourselves to considering these. We must collect any other common character which
 15 we observe, and then consider with what species it is connected and what properties belong to it. For example, as the common properties of horned animals we collect the possession of a third stomach and only one row of teeth. Then since it is clear in virtue of what character they possess these attributes—namely their horned character—the next question is, to what species does the possession of horns attach?

20 Yet a further method of selection is by analogy: for we cannot find a single identical name to give to a squid's pounce, a fish's spine, and an animal's bone, although these

¹ ἀνατομή seems to mean *that* analysis of a subject, for the purpose of eliciting its properties, which would precede the process of division exhibiting the true generic character in virtue of which the subject possesses those properties. Bonitz, however, takes it as equivalent to διαιρέσις (Index s. v.).

² i.e. the subgenera. Cf. the previous chapter.

³ Placing commas after ὁμοῖα^a 6 and ἐγγύτερα^a 7.

⁴ Aristotle in this chapter is explaining how to select the true primary subject—cf. i, 4 ad fin.—of a property; not how to find the middle term—with which he deals, e.g., in cc. 15–18—and διὰ τι here means *quatenus*, not *propter quod*.

too possess common properties as if there were a single osseous nature.

- 15 Some connexions that require proof are identical in that they possess an identical 'middle'¹—e. g. a whole group might be proved through 'reciprocal replacement'²—and of these one class are identical in genus, namely all those whose difference consists in their concerning different subjects or in their mode of manifestation. This latter class may be exemplified by the questions as to the causes respectively of echo, of reflection, and of the rainbow: the connexions to be proved which these questions embody are identical generically, because all three are forms of repercussion; but specifically they are different.

Other connexions that require proof only differ in that the 'middle' of the one is subordinate to the 'middle' of the other. For example: Why does the Nile rise towards the end of the month? Because towards its close the month is more stormy. Why is the month more stormy towards its close? Because the moon is waning. Here the one cause is subordinate to the other.

- 16 The question might be raised with regard to cause and effect whether when the effect is present the cause also is present; whether, for instance, if a plant sheds its leaves or the moon is eclipsed, there is present also the cause of the eclipse or of the fall of the leaves—the possession of broad leaves, let us say, in the latter case, in the former the earth's interposition.³ For, one might argue, if this cause is not present, these phenomena will have some other cause: if it *is* present, its effect will be at once implied by it—the eclipse by the earth's interposition, the fall of the leaves by the possession of broad leaves;⁴ but if so, they will be logically coincident and each capable of proof through the other. Let me illustrate: Let *A* be decituous character, 5

¹ *vide* note on 89^b 38.

² Cf. Waitz *ad loc.*

³ Placing a dash instead of a full stop after *ἔστιν* in ^a 38.

⁴ Placing a colon instead of a full stop after *φύλλορροή* in ^b 4.

B the possession of broad leaves, *C* vine. Now if *A* inheres in *B* (for every broad-leaved plant is deciduous), and *B* in *C* (every vine possessing broad leaves); then *A* inheres in *C* (every vine is deciduous), and the middle term *B* is the
 10 cause. But we can also demonstrate that the vine has broad leaves because it is deciduous. Thus, let *D* be broad-leaved, *E* deciduous, *F* vine. Then *E* inheres in *F* (since every vine is deciduous), and *D* in *E* (for every deciduous
 15 plant has broad leaves): therefore every vine has broad leaves, and the cause is its deciduous character. If,¹ however, they cannot each be the cause of the other (for cause is prior to effect, and the earth's interposition is the cause of the moon's eclipse and not the eclipse of the interposition)² —if, then, demonstration through the cause is of the
 20 reasoned fact and demonstration not through the cause is of the bare fact, one who knows it through the eclipse knows the fact of the earth's interposition but not the reasoned fact. Moreover, that the eclipse is not the cause of the interposition, but the interposition of the eclipse, is obvious because the interposition is an element in the definition of eclipse, which shows that the eclipse is known through the interposition and not vice versa.

25 On the other hand, can a single effect have more than one cause? One might argue as follows: if the same attribute is predicable of more than one thing as its primary subject, let *B* be a primary subject in which *A* inheres, and *C* another primary subject of *A*, and *D* and *E* primary subjects of *B* and *C* respectively. *A* will then inhere in *D* and *E*, and *B* will be the cause of *A*'s inherence in *D*, *C* of *A*'s inherence in *E*. The presence of the cause thus
 30 necessitates that of the effect, but the presence of the effect necessitates the presence not of all that may cause it but only of a cause which yet need not be the whole cause.

¹ Here begins Aristotle's answer.

² The parenthesis should evidently continue to ἐκλείπειν in b 19 and be followed by a dash. The construction is an anacoluthon: Aristotle instead of continuing καὶ εἰ . . . breaks off and starts again, and ends with an apodosis which is the consequent of the second εἰ clause; though his real conclusion—that such demonstration is not circular because demonstration through the effect is only of the bare fact—is wider, and follows from both εἰ clauses.

We may, however, suggest¹ that if² the connexion to be proved is always universal and commensurate, not only will the cause be a whole but also the effect will be universal and commensurate. For instance, deciduous character will belong exclusively to a subject which is a whole, and, if this whole has species, universally and commensurately to those species—i. e. either to all species of plant or to a single species. So in these universal and commensurate con-
 nexions the 'middle' and its effect must reciprocate, i. e. be convertible. Supposing, for example, that the reason why trees are deciduous is the coagulation of sap, then if a tree is deciduous, coagulation must be present, and if coagulation is present—not in *any* subject but in a tree—then that tree must be deciduous.

- 17 Can the cause of an identical effect be not identical in every instance of the effect but different? Or is that impossible? Perhaps it is impossible if the effect is demonstrated as essential and not as inhering in virtue of a symptom or an accident—because the middle is then the definition of the major term—though possible if the demonstration is not essential. Now it is possible to consider the effect and its subject as an accidental con-
 junction, though such conjunctions would not be regarded as connexions demanding scientific proof. But if they are accepted as such,³ the middle will correspond to the extremes, and be equivocal if they are equivocal, generically one if they are generically one.⁴ Take the question why proportionals alternate. The cause when they are lines, and when they are numbers,⁵ is both different and identical; different in so far as lines are lines and not numbers, identical as involving a given determinate increment. In all proportionals this is so. Again, the cause of likeness between colour and colour is other than that between figure and figure; for likeness here is equivocal, meaning perhaps

¹ Here begins Aristotle's answer.

² Really equivalent to *ἐπεὶ*, but *εἰ* is more consonant with the tentative form in which Aristotle offers his solution.

³ i. e. if an accidental connexion is accepted as a *πρόβλημα*.

⁴ We should perhaps read *ἐν* for *ἐν* in * 7.

⁵ Placing a comma after *ἀριθμοῖς* in * 9.

in the latter case equality of the ratios of the sides and equality of the angles, in the case of colours identity of the
 15 act of perceiving them, or something else of the sort. Again, connexions requiring proof which are identical by analogy have middles also analogous.

The truth is that cause, effect, and subject are reciprocally predicable in the following way. If the species are taken severally, the effect is wider than the subject (e.g. the possession of external angles equal to four right angles is an attribute wider than triangle or square), but it is co-
 20 extensive with the species taken collectively (in this instance with all figures whose external angles are equal to four right angles). And the middle likewise reciprocates, for the middle is a definition of the major; which is incidentally the reason why all the sciences are built up through definition.

We may illustrate as follows. Deciduous is a universal attribute of vine, and is at the same time of wider extent than vine; and of fig, and is of wider extent than fig: but it is not wider than but coextensive with the totality of the
 25 species. Then if you take the middle which is proximate,¹ it is a definition of deciduous. I say that, because you will first reach a middle² next the subject,³ and a premiss asserting it⁴ of the whole subject, and after that a middle—the coagulation of sap or something of the sort—proving the connexion of the first middle with the major:⁵ but it is the coagulation of sap at the junction of leaf-stalk and stem which defines deciduous.⁶

¹ *sc.* to τὸ φύλλορροεῖν, the major.

² *sc.* broad-leaved.

³ Vine, fig, &c.

⁴ Broad-leaved with deciduous.

⁵ Aristotle contemplates four terms: (1) deciduous, (2) coagulation, (3) broad-leaved, (4) vine, fig, &c.

⁶ One should perhaps read δ τι.

If we get the middle proximate to (1) it is a definition of (1). But in investigating vines, figs, &c. according to the method of chapter 13, we shall first find a common character of them in broad-leaved, and, taking this as a middle, we shall prove that vine, fig, &c., *quia* broad-leaved, are deciduous. But this proof is not demonstration, because broad-leaved is not a definition of deciduous. So our next step will be to find a middle—coagulation—mediating the major premiss of this proof, and demonstrate that broad-leaved plants, *quia* liable to coagulation, are deciduous. This is strict demonstration, because coagulation defines deciduous.

If an explanation in formal terms of the inter-relation of 30
cause and effect is demanded, we shall offer the following.
Let *A* be an attribute of all *B*, and *B* of every species of *D*,
but so that both *A* and *B* are wider than their respective
subjects. Then *B* will be a universal attribute of each
species of *D* (since I call such an attribute universal even
if it is not commensurate, and I call an attribute primary
universal if it is commensurate,¹ not with each species
severally but with their totality),² and it extends beyond
each of them taken separately. Thus, *B* is the cause of *A*'s 35
inherence in the species of *D*: consequently *A* must be of
wider extent than *B*; otherwise why should *B* be the cause
of *A*'s inherence in *D* any more than *A* the cause of *B*'s
inherence in *D*? Now if *A* is an attribute of all the species
of *E*, all the species of *E* will be united by possessing some
common cause other than *B*: otherwise how shall we be
able to say that *A* is predicable of all of which *E* is
predicable, while *E* is not predicable of all of which *A* can 99^b
be predicated? I mean how can there fail to be some
special cause of *A*'s inherence in *E*, as there was of *A*'s
inherence in all the species of *D*?³ Then are the species
of *E*, too, united by possessing some common cause? This
cause we must look for. Let us call it *C*.⁴

We conclude, then, that the same effect may have more
than one cause, but not in subjects specifically identical.
For instance, the cause of longevity in quadrupeds is lack of
bile, in birds a dry constitution—or certainly something
different.

18⁵ If immediate premisses are not reached at once, and there

¹ But cf. i, ch. 4, 73^b 21-74^a 3.

⁴ The schema of Aristotle's argument in this paragraph is:

⁵ It seems best to begin this chapter at εἰ δὲ εἰς . . . ^b 7, and place a comma after πλείων in ^b 8. The δὲ after πρότερον in ^b 9 will then be roughly parallel to e.g. *Pol.* iii. 16, 1287^b 13 (cf. Bonitz, *Ind.* s.v.), though the apodosis is not here an antithesis.

is not merely one middle but several middles, i. e. several causes; is the cause of the property's inherence in the several species the middle which is proximate to the primary universal,¹ or the middle which is proximate to the species?² Clearly the cause is that nearest to each species severally in which it is manifested, for that is the cause of the subject's falling under the universal. To illustrate formally: *C* is the cause of *B*'s inherence in *D*; hence *C* is the cause of *A*'s inherence in *D*, *B* of *A*'s inherence in *C*, while the cause of *A*'s inherence in *B* is *B* itself.

- ¹⁵ As regards syllogism and demonstration, the definition of, and the conditions required to produce each of them, are now clear, and with that also the definition of, and the conditions required to produce, demonstrative knowledge, since it is the same as demonstration. As to the basic premisses, how they become known and what is the developed state of knowledge of them is made clear by raising some preliminary problems.
- ²⁰ We have already said³ that scientific knowledge through demonstration is impossible unless a man knows the primary immediate premisses. But there are questions which might be raised in respect of the apprehension of these immediate premisses: one might not only ask whether it is of the same kind as the apprehension of the conclusions, but also whether there is or is not scientific knowledge of both; or scientific knowledge of the latter, and of the former a different kind of knowledge; and, further, whether the
- ²⁵ developed states of knowledge are not innate but come to be in us, or are innate but at first unnoticed. Now it is strange if we possess them from birth; for it means that we possess apprehensions more accurate than demonstration and fail to notice them. If on the other hand we acquire them and do not previously possess them, how could we apprehend and learn without a basis of pre-existent knowledge? For that is impossible, as we used
- ³⁰ to find⁴ in the case of demonstration. So it emerges that neither can we possess them from birth, nor can they come

¹ i. e. the property.² the subject.³ i, ch. 2.⁴ i, ch. 1.

to be in us if we are without knowledge of them to the extent of having no such developed state at all. Therefore we must possess a capacity of some sort, but not such as to rank higher in accuracy than these developed states. And this at least is an obvious characteristic of all animals, for they possess a congenital discriminative capacity which is called 35 sense-perception. But though sense-perception is innate in all animals, in some the sense-impression comes to persist, in others it does not. So animals in which this persistence does not come to be have either no knowledge at all outside the act of perceiving, or no knowledge of objects of which no impression persists; animals in which it does come into being have perception and can continue to retain the sense-impression in the soul: and when such persistence is 100^a frequently repeated¹ a further distinction at once arises between those which out of the persistence of such sense-impressions develop a power of systematizing them and those which do not. So out of sense-perception comes to be what we call memory, and out of frequently repeated memories of the same thing develops experience; for a 5 number of memories constitute a single experience.² From experience again—i. e. from the universal now stabilized in its entirety within the soul, the one beside the many which is a single identity within them all—originate the skill of the craftsman and the knowledge of the man of science, skill in the sphere of coming to be and science in the sphere of being.

We conclude that these states of knowledge are neither innate in a determinate form, nor developed from other 10 higher states of knowledge, but from sense-perception. It is like a rout in battle stopped by first one man making a stand and then another, until the original formation has been restored. The soul is so constituted as to be capable of this process.

Let us now restate the account given already, though with insufficient clearness. When one of a number of 15 logically indiscriminable particulars has made a stand, the

¹ Reading γενομένων with D in 100^a 1.

² Cf. *Met.* A 980^a 28. *Met.* A 1 should be compared with this chapter.

earliest universal is present in the soul: for though the act of sense-perception is of the particular, its content is universal—is man, for example, not the man Callias.¹ A fresh stand is made among these rudimentary universals, and the process does not cease until the indivisible concepts, the true universals,² are established: e. g. such and such a species of animal is a step towards the genus animal,³ which by the same process is a step towards a further generalization.

Thus it is clear that we must get to know the primary premisses by induction; for the method by which even sense-perception implants the universal is inductive. Now of the thinking states by which we grasp truth, some are unfailingly true, others admit of error—opinion, for instance, and calculation, whereas scientific knowing and intuition⁴ are always true: further, no other kind of thought except intuition is more accurate than scientific knowledge, whereas primary premisses are more knowable than demonstrations, and all scientific knowledge is discursive. From these considerations it follows that there will be no scientific knowledge of the primary premisses, and since except intuition nothing can be truer than scientific knowledge, it will be intuition that apprehends the primary premisses—a result which also follows from the fact that demonstration cannot be the originative source of demonstration, nor, consequently, scientific knowledge of scientific knowledge. If, therefore, it is the only other kind of true thinking except scientific knowing, intuition will be the originative source of scientific knowledge. And the originative source of science grasps the original basic premiss, while science as a whole is similarly related as originative source to the whole body of fact.⁵

¹ Removing the brackets, reading a colon after καθόλου * 16 and a full stop after Καλλίου ἀνθρώπου in ^b 1.

² i. e. the categories, which are *par excellence* universal and are indivisible because not constituted of genus and differentia, cf. *Met.* 1084^b 14 and 1023^b 24. For this sense of ἀμερῇ cf. the use of ἄτομα in *Met.* 994^b 21.

Existence, v. *Being*.

Experience (ἐμπειρία) 46^a 18, 100^a 5-9.

Exposition 28^a 23, 30^a 9, ^b 31, 49^b 33.

Fact χ reasoned fact 75^a 16, 76^a 11-13, 87^a 31; within one science 78^a 22-^b 31; as belonging to different sciences 78^b 32-79^a 16; in relation to perception χ knowledge 88^a 1; both as object of opinion 89^a 15; when both are obvious to perception 89^b 23-35, 90^a 25-30, 93^a 17-20. Cf. *Cause, Demonstration, Middle term*.

Fallacy, v. *Error*.

False cause 65^a 38-66^a 15.

Falsehood, falsity 16^a 12, 88^a 25-30. Cf. *Error*.

Fatality 18^b 26-19^b 4.

Features, inference of character from 70^b 7.

Figure, first 25^b 26-26^b 33, def. 25^b 32, 26^b 33; second 26^b 34-28^a 9, def. 26^b 34; third 28^a 10-29^a 18, def. 28^a 10; 'fourth' 29^a 19, 53^a 3; common properties of the three figures 29^a 19-^b 28; all syllogisms reducible to universal moods of first figure 29^b 1, 40^b 17-41^b 5; uses of the figures 42^b 27-43^a 19; analysis of syllogisms in one figure into another 50^b 5-51^b 2; three figures only 41^a 14.

Forms 79^a 7; Platonic 77^a 5, 83^a 33, 85^b 19.

Fortuitous, def. 18^b 8.

Genus, relative, individual not 11^a 20; χ species 96^b 21-5; prior to species 15^a 4; genera, co-ordinate 1^b 16, subordinate ib. 21. Cf. *Subject, Demonstration, elements of*.

Geometry 75^b 12-14, 17-19, 77^a 40-^b 27; use of diagrams in 49^b 35; its assumptions 76^b 9, are not false 76^b 39-77^a 2; differs generically from Arithmetic 75^a 39, ^b 3. Cf. *Science*.

Good χ the good 49^b 10.

Habit χ disposition 8^b 27, 35, 9^a 4, 11^a 22.

Harmonics 75^b 16, 76^a 10, 76^a 24, 76^b 38; mathematical; acoustical 79^a 1.

Have, uses of word 15^b 17-33.

Hypothesis 72^a 20-4; χ axiom 76^b 23-34; χ definition 76^b 35-77^a 4; χ illegitimate postulate 76^b 30-4; hypothetical reasoning 40^b 25, 41^a 22, 50^a 16, 72^b 13-15, 92^a 6-33; rule of hypothetical reasoning 53^b 12, 57^b 1. Cf. *Reductio ad impossibile*.

Ignorance, v. *Error*.

Iliad, the 92^b 32, 93^b 36.

Immediate propositions 48^a 33, 68^b 30; immediately cohering (συνεχῆς) 87^b 6.

INDEX

Impossibility, contradictory of propositions expressing 22^a 6.
 Indefinite noun 16^a 32, 19^b 8, verb 16^b 14, 19^b 10, premiss 24^a 19, 26^a 28; proof from indef. nature of particular statement 26^b 14, 27^b 20, 28, 28^b 28, 35^b 11; = possible 32^b 10, 19. Cf. *Infinite*.
 Individual 1^b 4, 3^a 35, 17^a 37, 40, 43^a 25.
 Induction 28^b 21, 42^a 3, 67^a 23, 68^b 8-37, 69^a 16, 71^a 6, 10, 72^b 30, 77^b 35, 78^a 35, 81^b 3, 90^b 14; gives grasp of universal 81^b 2, 100^b 4; conn. with sense-perception 81^a 38-9; λ demonstration 91^b 35; λ definition 92^a 37-1.
 Infinite proposition, an affirmation 25^b 22, 51^b 31, 52^a 24. Cf. *Indefinite*.
 Instances, proof by taking 26^a 8, 30^a 28, 31^b 4, 33^b 3, 49^b 33.
 Intuition (*νοῦς*) 85^a 1, 88^a 7, 16, 35, 89^b 8, 100^b 5-17. Cf. *Knowledge*, *Demonstration*.
 Inversion of subject and predicate 20^b 1.
 Isosceles triangle, proof of equality of angles at base 41^b 14.
 Knowledge 67^b 4; of universal (particular 67^a 17; kn. pre-existent, dependence of instruction on 71^a 1-11, two kinds of ^a 11-18; discursive (*διανοία*) 89^b 7; scientific kn. (*ἐπιστήμη*), its object immutable 71^b 15, its truth necessary 73^a 21, based on 'appropriate' premisses 76^a 27, accidental kn. = kn. through cause 71^b 9-12, 74^b 23, 26-39, 76^a 4-6, = kn. of definition 93^a 20-6, 94^a 2, suggested impossibility of 72^b 5-15; λ intuition 99^b 15-100^b 17; λ sense-perception 87^b 28-88^a 17, 99^b 15-100^b 17; λ opinion 88^b 30-89^b 6; unqualified λ universal 71^a 28, λ hypothetical 83^b 38; as state (*εἶς*) 99^b 18-100^b 17; growth of in individual soul ib.; ? innate ib.; ? all kn. demonstrable 72^b 6, 15-18, 84^a 31; kn. of basic premisses (*νοῦς*) 72^b 24, is prior and superior to kn. of conclusion 72^a 26, indemon-

strable and source of demonstration 72^b 18-24, 84^a 31, 90^b 25 and *passim*. Cf. also *Demonstration*, *Intuition*.

Limit as genus of figure 74^b 1.

Line, a quantity 5^a 17.

Love 66^a 39.

Lunules, squaring of circle by means of 69^a 33.

Lysander 97^b 21.

Major term 26^a 22, ^b 37, 28^a 13; wider than middle 77^a 18. Cf. *Middle term*.

Mathematics, nature of 79^a 7-9, 81^b 4, 93^b 24; its teaching depends on previous knowledge 71^a 3, on induction 81^b 3; formal fallacy rare in 77^b 27-33; λ dialectic 78^a 12. Cf. *Arithmetic*, *Geometry*, *Stereometry*, *Science*.

Mechanics 76^a 24, 78^b 39.

Medicine 77^a 41, 79^a 14.

Memory, developed from sense-perception 99^b 36, into experience 100^a 3-6.

Metaphor 97^b 37.

Metaphysics (*σοφία*) 89^b 8.

Miccalus 47^b 30.

Middle term 41^a 3, 47^a 38-14; homogeneous with extremes ('appropriate') 75^b 10, 80^b 18-21, 81^a 17, 84^b 15, 93^a 10; in causal inference 95^a 36-9; necessary λ contingent 74^b 26-12, 75^a 17, 76^a 5; as cause 78^b 4, 89^b 36-90^a 34 *passim*, 93^a 3-8; defines major term 93^b 6, 94^a 5, 94^b 19, 98^b 23, 99^a 4, 31-3; defines minor term 72^b 24; defined by major term 94^b 21. Cf. *Cause*, *Close-packing*, *Demonstration*, *Fact*, *Predication*, *Quick wit*.

Minor term 26^a 22, ^b 38, 28^a 14. Cf. *Middle term*.

Modality 21^a 34-23^a 26, 25^a 1, 29^b 29, 32^a 15, 34^a 5; modal syllogisms 29^b 29-40^b 16, 45^b 28-35.

Movement, kinds of 15^a 13-33; contrary of 15^b 1.

Natural 32^b 5, 16, 70^b 8.

INDEX

Necessary, v. *Attribute*, *Demonstration*, *Premiss*, &c

Necessity, contradictory of propositions expressing 21^b 26, 22^a 3; in inference 24^b 19, 26^a 3, 47^a 33, 53^b 18, 57^a 40, 62^a 11; in conversion 25^a 5; two kinds of 94^b 37; necessary & possible 32^a 18, 28; nothing n. follows from single statement 34^a 17, 40^b 35, 53^b 16; conversion of n. propositions 25^b 27; syllogisms with two n. premisses 29^b 29—30^a 14; with one pure and one n. premiss 30^a 15—32^a 5; with one contingent and one n. premiss 35^b 23—36^b 25, 38^a 13—39^a 3, 40^a 4—16, conclusion n. though only one premiss n. 30^a 15, 39, 32^a 7.

Negation & affirmation 13^a 37—35, 17^a 9, 25, 72^a 14

Negative term 51^b 5—52^b 34.

Nile 98^a 31.

Noun def. 16^a 19; composite ib. 23; indefinite 10. 30; cases of 16^b 1.

Number 4^b 23.

Objection (*ἐνστάσις*) 69^a 37—70^a 2, 73^a 33, 74^b 19—21, 76^b 26, 77^b 34—9.

Opinion 4^a 23, 66^b 19; defined 89^a 4; & knowledge 88^b 30—89^b 6; true & false 89^a 24—32. Cf. *Fact*.

Opposite, four uses of term 11^b 16—13^b 35; o. propositions, six pairs of 19^b 24—20^a 3.

Opposition 27^a 29, 59^b 6, 63^b 24; of propositions 19^b 5—20^b 10; of problematic and apodictic propositions 32^a 22, 37^a 9.

Optics 75^b 16, 76^a 24, 77^a 2, 78^b 37.

Ostensive proof 40^b 30; & *reductio ad impossibile* 29^a 31, 45^a 26, 36, 62^b 29—63^b 22.

Particulars 100^a 15—^b 1; objects of sense-perception & science 81^b 1—9. Cf. *Universal*, *Sense-perception*.

Peculiar (*ἰδιος*), v. *Property*; applied to elements in essential nature 91^a 15, 92^a 8.

Perception, v. *Sense-perception*.

Persian war 94^a 36.

Petio principii 41^b 8, 64^b 26 65^a 37.

Phocians 69^a 2.

Pittacus 70^a 16, 26

Place 2^a 1, 11^b 11.

Plato, reference to *Meno* 67^a 21, 71^a 29, (*Euthydemus*) 74^b 23, (*Theaetetus*) 76^b 25; method of division 46^a 31. Cf. *Forms*.

Position 2^a 2, 11^b 9.

Positive & privative 12^a 26—13^a 36.

Possibility 21^a 35, ^b 12, 23^a 7, 32^a 16—^b 37, 36^b 26—37^b 18; def. 32^a 18, cf. 33^b 30, 34^b 27; meanings of 22^a 15, 25^a 37, ^b 15, 31^b 6, 32^b 4, 33^a 3, 37^a 15, conversion in mode of 25^a 37, 32^a 29, 33^a 8, 35^b 35, syllogisms with two contingent premisses 32^b 38—33^b 24, 36^b 26—37^b 18, 39^a 4—^b 6, with one contingent and one pure premiss 33^b 25—35^b 22, 37^b 19—38^a 12, 39^b 7—40^a 3; with one contingent and one necessary premiss 35^b 23—36^b 25, 38^a 13—39^a 3, 40^a 4—^b 16.

Postulate, illegitimate & hypothesis 76^b 23, 30—4

Potentiality, various senses of 22^b 36—23^a 18.

Practical wisdom (*φρόνησις*) 89^b 8.

Predetermination of future events 19^a 7—22.

Predication 24^b 17, 26, 25^b 20, 26^a 17, 32^b 25, 41^a 15, 43^a 25, ^b 17, 48^b 40, 49^a 16; natural (accidental 81^b 24—9, 82^a 20, 83^a 1—20; possibility of infinite series of 81^b 30—84^b 2; implies single subject and single attribute 83^a 22, ^b 17; series of (*συνστροφία*) 79^b 7, 81^a 21, 87^b 6, 14.

Premiss (*πρότασις*), def. 24^a 16; species of ib. 17, 25^a 1; demonstrative (dialectical 24^a 22; number of 42^a 32; rules for selecting 43^a 20—46^a 30; proper form of 71^b 4; at least two required for inference 73^a 10; as elements of conclusion (cf. also *Resolution*) 84^b 21; related as whole and part 92^a 12; as reciprocating with conclusion

INDEX

- 78^a 10; necessary χ general
(chance 87^b 19-27; false pre-
misses may give true conclusion
75^a 4, 78^a 7, 88^a 20; non-neces-
sary premisses may give neces-
sary conclusion 75^a 3; as basic
truth ($\acute{\alpha}\rho\chi\eta$), = an immediate
proposition ($\pi\rho\acute{o}\tau\alpha\iota\varsigma$) 72^a 7;
must be true, primary (and \therefore
indemonstrable 76^a 16), better
known than, cause of, conclu-
sion 71^b 21-3, necessary 73^a 24,
 \therefore essential 74^b 5-12, 75^a 30,
homogeneous with conclusion
87^b 1-4; equal in number to
middle terms 84^b 21; not much
fewer than conclusions 88^b 3-7;
none common to all sciences 6^a
17, 88^a 18-b 29; as definitions
75^b 3, 90^b 24; as unit of demon-
stration 84^b 36-85^a 1; negative
84^b 29-31; how the individual
comes to know them 99^b 15-
100^b 17. Cf. *Demonstration*,
Basic truth, *Knowledge*, *Intui-
tion*.
- Prime, two meanings of 96^a 35.
Prior, five senses of 14^a 26-b 23;
two senses of 71^b 33-72^a 5.
Privation 73^b 21.
Privative χ positive terms 12^a
26-13^a 36, 52^a 15.
Probability ($\epsilon\iota\kappa\omicron\varsigma$) 70^a 3.
Property 43^b 3; peculiar ($\iota\delta\iota\omicron\nu$)
73^a 7, 91^a 15, 92^a 8, and *An.
Post. passim*. Cf. *Attribute*.
Proportion, geometrical 78^a 1.
Cf. *Alternation*.
Proposition, simple 17^a 8, 20, 18^a
8-17; composite 17^a 9, 21;
contrary 17^b 20-18^a 12; con-
tradictory 17^a 25-37, ^b 17; uni-
versal, particular, indefinite 17^a
38-b 16, 24^a 17; universal
affirmative 24^b 26; negative
ib. 30; particular affirmative
25^a 10, neg. ib. 12, 22, 26^b 14;
singular χ universal 43^a 25; =
either part of an enunciation
72^a 8; immediate ib.; dialecti-
cal 72^a 9; demonstrative 72^a
10. Cf. *Premiss*.
Prosyllogism 42^b 5, 53^a 40, 66^a 25,
82^b 26, 86^b 23.
Pythagoreans 94^b 33.
Quality 1^b 26, 29, 8^b 25-11^a 38;
($\pi\omega\iota\acute{o}\tau\eta\varsigma$) not predicable of a
quality 82^a 36.
Quantification of predicate 43^b 17.
Quantity 1^b 26, 28, 4^b 20-6^a 35;
discrete χ continuous 4^b 20; of
premisses 47^b 15-40.
Question, dialectical 20^b 22.
Questions, four which cover the
whole sphere of knowledge 89^b
21-36; these all concern cause
and middle term 89^b 37-90^a 35.
Quick wit ($\acute{\alpha}\gamma\chi\iota\nu\omicron\iota\alpha$) 89^b 10-20.
Reason, cannot be established
from false premisses 53^b 9, 57^a
40.
Reciprocity of correlatives 6^b 28-
7^b 14; reciprocal proof 57^b 18,
59^a 32.
Reductio ad impossibile 28^b 15,
29^a 35, ^b 6, 34^a 3, 36^a 22, 37^a 9,

TOPICA
AND
DE SOPHISTICIS ELENCHIS
BY
W. A. PICKARD-CAMBRIDGE

PREFACE

THE following translation of the *Topics* and *Sophistici Elenchi* was begun upon the basis of Bekker's text, and though Strache's recension (edited by Wallies) certainly improves upon it at many points, I have not found reason to abandon the earlier text as a whole. A different reading from Bekker, where adopted, is indicated in a foot-note. In addition to the Greek commentaries and the anonymous paraphrase of *Sophistici Elenchi*, I have used the Latin translation and commentary of Pacius, and the editions of Buhle and Waitz. Of modern translations of the whole work, the most useful have been those of Kirchmann, St. Hilaire, and Rolfes. For the *Sophistici Elenchi* I have further had the advantage of Poste's edition and of the free paraphrase which serves for translation therein; also of some notes of the late Professor Cook Wilson (kindly lent me by Lt.-Col. A. S. L. Farquharson), principally on some points of mathematical theory. I am very much indebted to Mr. W. D. Ross for many useful criticisms and suggestions, and to my wife and Miss D. M. Hall for much tedious but invaluable labour in typing the translation and in the construction of the index.

TOPICA

CONTENTS

INTRODUCTORY (Book I, ch. 1-3)

BOOK I.

- ch. 1. Programme of treatise.
2. Uses of treatise.
3. Ideal aimed at.

A. SUBJECTS AND MATERIALS OF DIS- CUSSIONS (Book I, ch. 4-12)

4. Subjects (Problems) and materials (Propositions) classified into four groups according to nature of Predicable concerned.
5. The four Predicables.
6. How far to be treated separately.
7. Different kinds of sameness.
8. Twofold proof of division of Predicables.
9. The ten Categories and their relation to the Predicables.
10. Dialectical Propositions.
11. Dialectical Problems:—Theses.
12. Dialectical Reasoning)(Induction.

B. THE SUPPLY OF ARGUMENTS (Book I, ch. 13-Book VII)

13. Four sources of arguments:—
14. (1) How to secure propositions.
15. (2) „ distinguish ambiguous meanings.
16. (3) „ note differences.
17. (4) „ „ resemblances.
18. The special uses of the last three processes.

COMMONPLACE RULES RESPECTING PREDICATIONS

- (a) OF ACCIDENT. (i) *Universal Predications* (Books II-III, ch. 5)

Part I—Simple predications of Accidents generally (Book II)

BOOK II.

- ch. 1. Proposed plan of treatment.
2. Various rules.
3. Rules for dealing with Ambiguity.
4. Various rules.
5. Rules for diverting the argument.
6. Various rules.
7. Rules drawn from contraries.

BOOK II.

- ch. 8. Rules drawn from different modes of opposition, or kinds of opposite.
9. Rules drawn from co-ordinates and inflexions, from contraries, and from processes or agents whereby things come to be or are destroyed.
10. Rules drawn from likeness between things or their relations, and from variations in degree.
11. Rules for arguing (*a*) from the results of adding things together to the character of the things; (*b*) from qualified to simple or absolute predications.

Part II—Comparative predications of Value-predicates of A or B

(Book III, ch. 1-3)

BOOK III.

- ch. 1. Various rules; including rules drawn from nature of subjects to which A or B belong (116^b 12-22); or from consideration of ends and means (116^b 22-36).
2. Various rules; including rules drawn from consideration of antecedents and consequences (117^a 5-15); of numbers (117^a 16-25); of times and seasons (117^a 26-37); of self-sufficiency (117^a 37-^b 2); of destructions, losses, contraries, production, and acquisition (117^b 3-9); of some ideal pattern (117^b 10-27).
3. Various rules; including rules drawn from comparison with some common standard (118^b 1-4); from result of adding A and B to, or subtracting them from, some other thing of known value (118^b 10-19); from comparison of grounds for desiring A or B (118^b 20-36).

Part III—Simple predications of Value-predicates

(Book III, ch. 4)

4. How to adapt previous rules.

Part IV—Comparative predications of Accidents generally

(Book III, ch. 5)

5. Various rules.

(ii) *Particular Predications* (Book III, ch. 6)

6. How to adapt the previous rules (119^a 32-120^a 5).
Proof and disproof, how affected by definiteness or indefiniteness of thesis (120^a 6-31).
How to adapt the previous rules, continued (120^a 32-^b 7).

CONTENTS

vii

(b) OF GENUS (Book IV)

BOOK IV.

ch. 1-2. Various rules.

3. Various rules; including rules from contraries, useful for disproof (123^b 1- 124^a 2), and for proof (124^a 3-10); from inflexions and co-ordinates (124^a 10-14).
4. Various rules; including rules from likeness of relations (124^a 15-19); from processes or agents of generation and destruction (124^a 20-30); from capacities and uses of things (124^a 31-34); from opposition between states and their privations (124^a 35- b 6); from contradictory oppositions (124^b 7-14); from relative oppositions (124^b 15-34); from inflexions (124^b 35- 125^a 4): also special rules applying where genus and species are relative terms (125^a 5- b 14).
5. Various rules; including special rules applying where genus or species is a state, or a capacity or an affection.
6. Various rules; including rules from variations in degree, useful for disproof (127^b 18-36) and for proof (127^b 37- 128^a 12); also rules for distinguishing genus from differentia (128^a 20-30).

(c) OF PROPERTY (Book V)

BOOK V.

ch. 1. Different kinds of property (128^b 16- 129^a 16).

Suitability of each for discussion (129^a 17-31).

Lines of argument upon each (129^a 32-35).

2-3. *Rules for testing whether a property is rendered correctly.*

4-end. *Rules for testing whether a term belongs as a property at all:—*

4. Various rules; including note on certain sophistical difficulties arising from ambiguity of the terms 'same' and 'different'.
5. Various rules; including notes on difficulties arising from failure to say explicitly *how* the alleged property belongs (134^a 5-17, 18-25, 26- 135^a 9); and a special rule applying to a whole consisting of like parts (135^a 20- b 6).
6. Rules drawn from different modes of opposition—contrary opposition (135^b 7-16), relative opposition (135^b 17-26), that of a state and its privation (135^b 27- 136^a 4), contradictory opposition, applied to predicates only (136^a 6-13), to both predicates and subjects (136^a 14-28), and to subjects only (136^a 29- b 2); from co-ordinate members of a division (136^b 3-14).
7. Rules drawn from inflexions (136^b 15-32); from relations like the relation alleged to be a property (136^b 33- 137^a 7); from identity of relations between the alleged property and two subjects (137^a 8-20); from processes of becoming and destruction (137^a 21- b 2); from reference of the alleged property to the 'idea' of its subject (137^b 3-13).
8. Rules drawn from variations in degree (137^b 14- 138^a 29); from comparison of an attribute-relation that is like the alleged property-relation, between a different attribute and a different subject (138^a 30- b 5), between the subject of the alleged property and a different attribute (138^b 6-15), between the alleged property and a different subject (138^b 16-22).
9. Two rules (138^b 27- 139^a 8, 139^a 9-20).

(d) OF DEFINITION (Book VI)

BOOK VI.

- ch. 1. General division of problems relating to definition (139^a 24-35).
 Distinction of problems treated and problems yet to be treated (139^a 36-^b 11).
Rules for testing whether definition is rendered correctly:—
 obscurity and redundancy to be avoided (139^b 12-18).
2. Obscurity, how avoided.
3. Redundancy, how avoided.
- 4-end. *Rules for testing whether the formula rendered is a definition at all.*
4. Rules to secure that terms of definition shall be *prior and more intelligible*; how to detect failure in latter respect (141^b 3-142^a 21); in former (142^a 22-^b 19).
5. Rules as to *genus*.
6. " " *differentia*.
7. Various rules, including rules for testing the definition of terms admitting variations in degree (146^a 3-20).
8. Rules for testing the definition of a relative term.
9. Rules for testing the definition of a state (147^a 12-22); of a relative term (147^a 23-31); of contraries (147^a 32-^b 25); of a privation (147^b 26-148^a 2) or what is confused with one (148^a 3-9).
10. Rules drawn from like inflexions (148^a 10-13); from reference of the definition to the 'idea' of the term defined (148^a 14-22);
 Rules for testing the definition of an ambiguous term (148^a 23-^b 22).
11. Rules for testing the definition of a complex term.
12. Various rules, including rules for testing the definition of anything real (149^a 38-^b 3); of a relative term (149^b 4-23); of any term intrinsically valuable (149^b 31-39).
13. Definitions of the forms
 (1) X is 'A and B' (150^a 1-21).
 (2) X is 'the product of A and B' (150^a 22-^b 26).
 (3) X is 'A + B' (150^b 27-151^a 19).
14. Various rules; including rules how to test the definition of compound whole (151^a 20-31); and how to examine an unclear definition (151^b 3-17).

(e) OF SAMENESS (Book VII, ch. 1-2)

BOOK VII.

- ch. 1. Various rules.
2. Bearing of these rules on problem of definition.

(f) OF DEFINITION—*continued* (Book VII, ch. 3)

3. Rules for establishing a definition.
4. Note on the comparative usefulness of the different kinds of commonplace-rules.
5. Note on the comparative difficulty of proving or disproving the various kinds of Predicable.

C. CONCERNING THE PRACTICE OF, AND PRACTICE
IN, DIALECTICS (Book VIII)

(a) *How to arrange and put questions* (Book VIII, ch. 1-3)

BOOK VIII.

- ch. 1. Introductory (155^b 3-17).
 (1) *Of necessary and other premisses.*
 Premises other than necessary premisses, and their four aims
 (155^b 18-28).
 Use of necessary premisses (155^b 29-156^a 2).
 Use of premisses other than necessary
 (1) for inductions (156^a 3-7).
 (2) „ concealment of intended conclusion (156^a 7-157^a 5).
 (3) „ ornament (157^a 6-13).
 (4) „ clearness (157^a 14-17).
 2. (2) *Of inductions* (157^a 18-33).
 (3) *Of objections* (157^a 34-^b 33).
 (4) *Of argument per impossibile* (157^b 34-158^a 2).
 (5) Miscellaneous hints (158^a 3-30).
 3. On the comparative difficulty or ease of certain dialectical arguments.

(b) *How to answer* (Book VIII, ch. 4-10)

4. Answerer's role) (questioner's role.
 5. Introductory note on lack of tradition respecting discussions held for training and examination (159^a 25-37).
 The answerer's procedure as determined by the character
 (1) of his own thesis (159^a 38-^b 35);
 6-8. (2) of the particular question put—its general acceptability and relevance (ch. 6), its clearness (ch. 7), and its importance for the argument (ch. 8).
 9. Rules respecting the answerer's original thesis.
 10. On the solution of fallacious arguments (160^b 23-39).
 Four types of objection distinguished (161^a 1-15).

(c) *Supplementary discussions* (Book VIII, ch. 11-14)

11. On faults of argument and faults of questioner.
 12. On clearness in argument:—its three kinds distinguished (162^a 35-^b 2).
 On fallacy in argument: its four kinds distinguished (162^b 3-15); how far censurable (162^b 16-24): test questions for its detection (162^b 24-30).
 13. On begging the question, and on the begging of contraries:—five types of each distinguished.
 14. Hints upon training and practice in dialectical arguments.

DE SOPHISTICIS ELENCHIS

INTRODUCTORY (ch. 1-2)

- ch. 1. General distinction of genuine)(merely apparent reasonings and refutations.
2. Four classes of arguments in dialogue form :—Didactic arguments, Dialectical arguments, Examination arguments, and Contentious arguments (the subject of the present book).

PERPETRATION OF FALLACIES (ch. 3-15)

3. Aims of contentious reasoning fivefold :—
4. A. REFUTATION
 - (a) *by fallacies dependent on diction* : proof that these are six in number (165^b 24-30) :—due respectively to
 - (1) Ambiguity (165^b 30-166^a 6) ;
 - (2) Amphiboly (166^a 6-23) ;
 - (3) Ambiguous combination of words (166^a 23-32) ;
 - (4) Ambiguous division of words (166^a 33-8) ;
 - (5) Wrong accent (166^b 1-9) ;
 - (6) The form of expression used (166^b 10-21).
 - (b) *by fallacies not dependent on diction* : seven in number (166^b 21-7) :—depending respectively upon
5. (1) Accident (166^b 28-36) ;
 - (2) The use of words without or with qualification (166^b 37-167^a 20) ;
 - (3) Ignoratio elenchi (167^a 21-35) ;
 - (4) Petitio principii (167^a 36-9) ;
 - (5) The consequent (167^b 1-20) ;
 - (6) False cause (167^b 21-38) ;
 - (7) Many questions (167^b 38-168^a 16).
6. Proof that all the above can be exhibited as forms of a single fallacy, viz. *ignoratio elenchi*.
7. Proof that all the above arise from confusion and failure to draw proper distinctions.
8. (c) *by arguments (or refutations) which, though valid, are only apparently appropriate to the subject-matter*)(Examination-arguments, which expose ignorance of the subject by arguments really appropriate to it (169^b 18-29).

These sophistical refutations can all be analysed by the same method as the forms of apparent proof (169^b 30-170^a 11).

Sophistical refutation never refutes absolutely, but always relatively (to the answerer) (170^a 12-19).

9. Refutations being infinite in number, an exhaustive study of all is impossible (170^a 20-34).

Our concern is not with those that rest on principles peculiar to any particular science (170^a 34-8).

The object of dialectic is to grasp how to construct and to solve refutations that depend on dialectic, i. e. on common principles (i. e. such refutations as are either really dialectical or apparently dialectical, or suited to an examination) (170^a 38-11).

- ch. 10. The distinction of arguments directed against the expression
(arguments directed against the thought expressed, exposed
as unreal.
Didactic)(dialectical argument (171^a 31-^b 2 : cf. 172^a 15-21).
- 11. Examination-argument and dialectical (171^b 3-6, 172^a 21-^b 1).
Contentious (sophistical) reasoning)(dialectical (171^b 6-7, 34-
172^a 15).
Two types of contentious reasoning (171^b 8-10, 11 ff.).
- 12. *B. FALLACY*: how to show (172^b 10-28).
C. PARADOX: how to entrap into (172^b 10-24, 29-173^a 30).
- 13. *D. BABBLING*: how to produce.
- 14. *E. SOLECISM*: how to produce.
- 15. How to arrange arguments most effectively.

SOLUTION OF FALLACIES (ch. 16-32).

- 16. General remarks:—uses of studying solutions: need of
practice.
- 17. Of apparent solutions.
- 18. Of genuine solutions.
- 19. *A. Solution of REFUTATIONS*
(*a*) *dependent on diction* (ch. 19-23)
 - (1) Ambiguity, and
 - (2) Amphiboly
- 20. (3) Ambiguous division, and
(4) Ambiguous combination, of words.
- 21. (5) Wrong accent.
- 22. (6) Like expressions for different things.
- 23. General rule for solution of fallacies depending on diction ,
(*b*) *not dependent on diction* (ch. 24-30).
 - 24. (1) Accident.
 - 25. (2) The use of words with or without qualification.
 - 26. (3) Ignoratio elenchi.
 - 27. (4) Petitio principii.
 - 28. (5) The consequent.
 - 29. (6) Insertion of irrelevant matter (False cause).
 - 30. (7) Many questions.
- 31. *B. Solution of arguments tending to BABBLING.*
- 32. *C. " " " " SOLECISM.*
- 33. Varying degrees of "difficulty" in respect of fallacies.

EPILOGUE

- 34. (1) Our programme and its performance (183^a 27-^b 15).
- (2) History of dialectical theory compared with that of rhetoric
(183^b 15-end).

BOOK I

100^a

I OUR treatise proposes to find a line of inquiry where- 18
by we shall be able to reason from opinions that are gen-
erally accepted about every problem propounded to us, 20
and also shall ourselves, when standing up to an argument,
avoid saying anything that will obstruct us. First, then, we
must say what reasoning is, and what its varieties are, in
order to grasp dialectical reasoning: for this is the object
of our search in the treatise before us.

Now reasoning is an argument in which, certain things 25
being laid down, something other than these necessarily
comes about through them. (a) It is a 'demonstration',
when the premisses from which the reasoning starts are
true and primary, or are such that our knowledge of them
has originally come through premisses which are primary
and true: (b) reasoning, on the other hand, is 'dialectical', 30
if it reasons from opinions that are generally accepted. Things
are 'true' and 'primary' which are believed on the strength 100^b
not of anything else but of themselves: for in regard to the 18
first principles of science it is improper to ask any further
for the why and wherefore of them; each of the first prin- 30
ciples should command belief in and by itself. On the other
hand, those opinions are 'generally accepted' which are
accepted by every one or by the majority or by the philoso-
phers—i. e. by all, or by the majority, or by the most notable
and illustrious of them. Again (c), reasoning is 'contentious'
if it starts from opinions that seem to be generally accepted,
but are not really such, or again if it merely seems to reason 35
from opinions that are or seem to be generally accepted.
For not every opinion that seems to be generally accepted
actually is generally accepted. For in none of the opinions
which we call generally accepted is the illusion entirely on
the surface, as happens in the case of the principles of con-
tentious arguments; for the nature of the fallacy in these is

30 obvious immediately, and as a rule even to persons with
 101^a little power of comprehension. So then, of the contentious
 reasonings mentioned, the former really deserves to be called
 'reasoning' as well, but the other should be called 'contentious
 reasoning', but not 'reasoning', since it appears to
 reason, but does not really do so.

5 Further (*d*), besides all the reasonings we have mentioned
 there are the mis-reasonings that start from the premisses
 peculiar to the special sciences, as happens (for example) in
 the case of geometry and her sister sciences. For this form
 of reasoning appears to differ from the reasonings mentioned
 above; the man who draws a false figure reasons from things
 10 that are neither true and primary, nor yet generally accepted.
 For he does not fall within the definition; he does not assume
 opinions that are received either by every one or by the
 majority or by philosophers—that is to say, by all, or by
 most, or by the most illustrious of them—but he conducts
 his reasoning upon assumptions which, though appropriate
 15 to the science in question, are not true; for he effects his
 mis-reasoning either by describing the semicircles wrongly
 or by drawing certain lines in a way in which they could
 not be drawn.

The foregoing must stand for an outline survey of the
 species of reasoning. In general, in regard both to all that
 20 we have already discussed and to those which we shall
 discuss later, we may remark that that amount of distinction
 between them may serve, because it is not our purpose to
 give the exact definition of any of them; we merely want
 to describe them in outline; we consider it quite enough
 from the point of view of the line of inquiry before us to be
 able to recognize each of them in some sort of way.

25 Next in order after the foregoing, we must say for how
 many and for what purposes the treatise is useful. They
 are three—intellectual training, casual encounters, and the
 philosophical sciences. That it is useful as a training is
 obvious on the face of it. The possession of a plan of inquiry
 30 will enable us more easily to argue about the subject pro-
 posed. For purposes of casual encounters, it is useful because

when we have counted up the opinions held by most people, we shall meet them on the ground not of other people's convictions but of their own, while we shift the ground of any argument that they appear to us to state unsoundly. For the study of the philosophical sciences it is useful, because the ability to raise searching difficulties on both 35 sides of a subject will make us detect more easily the truth and error about the several points that arise. It has a further use in relation to the ultimate bases of the principles used in the several sciences.¹ For it is impossible to discuss them at all from the principles proper to the particular science in hand, seeing that the principles are the *prins* of everything else: it is through the opinions generally held on the par- 107^b ticular points that these have to be discussed, and this task belongs properly, or most appropriately, to dialectic: for dialectic is a process of criticism wherein lies the path to the principles of all inquiries.

3 We shall be in perfect possession of the way to proceed 5 when we are in a position like that which we occupy in regard to rhetoric and medicine and faculties of that kind: this means the doing of that which we choose with the materials that are available. For it is not every method that the rhetorician will employ to persuade, or the doctor to heal: still, if he omits none of the available means, we shall say that his grasp of the science is adequate. 10

4 First, then, we must see of what parts our inquiry consists. Now if we were to grasp (*a*) with reference to how many, and what kind of, things arguments take place, and with what materials they start, and (*b*) how we are to become well supplied with these, we should have sufficiently won our goal. Now the materials with which arguments start are equal in number, and are identical, with the subjects on which reasonings take place. For arguments start 15 with 'propositions', while the subjects on which reasonings take place are 'problems'. Now every proposition and

¹ Or (omitting *ἀρχῶν* in l. 37 with B corr. and C) 'in relation to the ultimate bases of the several sciences'.

every problem indicates either a genus or a peculiarity or an accident—for the differentia too, applying as it does to a class (or genus), should be ranked together with the genus. Since, however, of what is peculiar to anything part signifies
 20 its essence, while part does not, let us divide the ‘peculiar’ into both the aforesaid parts, and call that part which indicates the essence a ‘definition’, while of the remainder let us adopt the terminology which is generally current about these things, and speak of it as a ‘property’. What we have said, then, makes it clear that according to our
 25 present division, the elements turn out to be four, all told, namely either property or definition or genus or accident. Do not let any one suppose us to mean that each of these enunciated by itself constitutes a proposition or problem, but only that it is from these that both problems and
 30 propositions are formed. The difference between a problem and a proposition is a difference in the turn of the phrase. For if it be put in this way, “An animal that walks on two feet” is the definition of man, is it not?’ or “Animal” is the genus of man, is it not?’ the result is a proposition: but if thus, ‘Is “an animal that walks on two feet” a definition of man or no?’ [or ‘Is “animal” his genus or no?’]¹ the result is a problem. Similarly too in other cases. Naturally,
 35 then, problems and propositions are equal in number: for out of every proposition you will make a problem if you change the turn of the phrase.

We must now say what are ‘definition’, ‘property’,⁵ ‘genus’, and ‘accident’. A ‘definition’ is a phrase signifying a thing’s essence. It is rendered in the form either of
 102^a a phrase in lieu of a term, or of a phrase in lieu of another phrase; for it is sometimes possible to define the meaning of a phrase as well. People whose rendering consists of a term only, try it as they may, clearly do not render the definition of the thing in question, because a definition is
 5 always a phrase of a certain kind. One may, however, use the word ‘definitory’ also of such a remark as ‘The “becoming” is “beautiful”’, and likewise also of the question,

¹ 101^b 33. The words καὶ . . . ἐστίν do not occur in the best MSS.

'Are sensation and knowledge the same or different?', for argument about definitions is mostly concerned with questions of sameness and difference. In a word we may call 'definitory' everything that falls under the same branch of inquiry as definitions; and that all the above-mentioned 10 examples are of this character is clear on the face of them. For if we are able to argue that two things are the same or are different, we shall be well supplied by the same turn of argument with lines of attack upon their definitions as well: for when we have shown that they are not the same we shall have demolished the definition. Observe, please, that the converse of this last statement does not hold: for to show 15 that they are the same is not enough to establish a definition. To show, however, that they are not the same is enough of itself to overthrow it.

A 'property' is a predicate which does not indicate the essence of a thing, but yet belongs to that thing alone, and is predicated convertibly of it. Thus it is a property of man to be capable of learning grammar: for if A be a man, then 20 he is capable of learning grammar, and if he be capable of learning grammar, he is a man. For no one calls anything a 'property' which may possibly belong to something else, e.g. 'sleep' in the case of man, even though at a certain time it may happen to belong to him alone. That is to say, if any such thing were actually to be called a property, it 25 will be called not a 'property' absolutely, but a 'temporary' or a 'relative' property: for 'being on the right hand side' is a temporary property, while 'two-footed' is in point of fact ascribed as a property in certain relations; e.g. it is a property of man relatively to a horse and a dog. That nothing which may belong to anything else than A is a convertible predicate of A is clear: for it does not necessarily follow that if something is asleep it is 30 a man.

A 'genus' is what is predicated in the category of essence of a number of things exhibiting differences in kind. We should treat as predicates in the category of essence all such things as it would be appropriate to mention in reply to the question, 'What is the object before you?'; as, for example.

35 in the case of man, if asked that question, it is appropriate to say 'He is an animal'. The question, 'Is one thing in the same genus as another or in a different one?' is also a 'generic' question; for a question of that kind as well falls under the same branch of inquiry as the genus: for having argued that 'animal' is the genus of man, and likewise also of ox, we shall have argued that they are in the same
 102^b genus; whereas if we show that it is the genus of the one but not of the other, we shall have argued that these things are not in the same genus.

An 'accident' is (1) something which, though it is none
 5 of the foregoing—i. e. neither a definition nor a property nor a genus—yet belongs to the thing: (2) something which may possibly either belong or not belong to any one and the self-same thing, as (e. g.) the 'sitting posture' may belong or not belong to some self-same thing. Likewise also 'whiteness', for there is nothing to prevent the same thing being at one time white, and at another not white. Of the defini-
 10 tions of accident the second is the better: for if he adopts the first, any one is bound, if he is to understand it, to know already what 'definition' and 'genus' and 'property' are, whereas the second is sufficient of itself to tell us the essential meaning of the term in question. To Accident are to be
 15 attached also all comparisons of things together, when expressed in language that is drawn in any kind of way from what happens (*accidit*) to be true of them; such as, for example, the question, 'Is the honourable or the expedient preferable?' and 'Is the life of virtue or the life of self-indulgence the pleasanter?', and any other problem which may happen to be phrased in terms like these. For in all such cases the question is 'to which of the two does
 20 the predicate in question happen (*accidit*) to belong more closely?' It is clear on the face of it that there is nothing to prevent an accident from becoming a temporary or a relative property. Thus the sitting posture is an accident, but will be a temporary property, whenever a man is the only person sitting, while if he be not the only one sitting, it is still a property relatively to those who are not sitting.
 25 So then, there is nothing to prevent an accident from be-

coming both a relative and a temporary property; but a property absolutely it will never be.

- 6 We must not fail to observe that all remarks made in criticism of a 'property' and 'genus' and 'accident' will be applicable to 'definitions' as well. For when we have shown that the attribute in question fails to belong only to the term defined, as we do also in the case of a property, or that the genus rendered in the definition is not the true genus, or that any of the things mentioned in the phrase used does not belong, as would be remarked also in the case of an accident, we shall have demolished the definition; so that, to use the phrase previously employed,¹ all the points we have enumerated might in a certain sense be called 'definitory'. But we must not on this account expect to find a single line of inquiry which will apply universally to them all: for this is not an easy thing to find, and, even were one found, it would be very obscure indeed, and of little service for the treatise before us. Rather, a special plan of inquiry must be laid down for each of the classes we have distinguished, and then, starting from the rules that are appropriate in each case, it will probably be easier to make our way right through the task before us. So then, as was said before,² we must outline a division of our subject, and other questions we must relegate each to the particular branch to which it most naturally belongs, speaking of them as 'definitory' and 'generic' questions. The questions I mean have practically been already assigned to their several branches.

- 7 First of all we must define the number of senses borne by the term 'Sameness'. Sameness would be generally regarded as falling, roughly speaking, into three divisions. We generally apply the term numerically or specifically or generically—numerically in cases where there is more than one name but only one thing, e.g. 'doublet' and 'cloak'; specifically, where there is more than one thing, but they present no differences in respect of their species, as one man and another, or one horse and another: for things like this

¹ 29.² 101^a 22.

that fall under the same species are said to be 'specifically the same'. Similarly, too, those things are called generically the same which fall under the same genus, such as a horse and a man. It might appear that the sense in which water
 15 from the same spring is called 'the same water' is somehow different and unlike the senses mentioned above: but really such a case as this ought to be ranked in the same class with the things that in one way or another are called 'the same' in view of unity of species. For all such things seem to be of one family and to resemble one another. For the reason
 20 why all water is said to be specifically the same as all other water is because of a certain likeness it bears to it, and the only difference in the case of water drawn from the same spring is this, that the likeness is more emphatic: that is why we do not distinguish it from the things that in one way or another are called 'the same' in view of unity of species. It is generally supposed that the term 'the same' is most used in a sense agreed on by every one when applied
 25 to what is numerically one. But even so, it is apt to be rendered in more than one sense; its most literal and primary use is found whenever the sameness is rendered in reference to an alternative name or definition, as when a cloak is said to be the same as a doublet, or an animal that walks on two feet is said to be the same as a man: a second sense is when it is rendered in reference to a property, as when what can acquire knowledge is called the same as a man, and what naturally travels upward the same as fire: while a third use is found when it is rendered in reference to some term drawn
 30 from Accident, as when the creature who is sitting, or who is musical, is called the same as Socrates. For all these uses mean to signify numerical unity. That what I have just said is true may be best seen where one form of appellation is substituted for another. For often when we give the order to call one of the people who are sitting down, indicating him by name, we change our description, whenever
 35 the person to whom we give the order happens not to understand us; he will, we think, understand better from some accidental feature; so we bid him call to us 'the man who is sitting' or 'who is conversing over there'—clearly

supposing ourselves to be indicating the same object by its name and by its accident.

8 Of 'sameness' then, as has been said,¹ three senses are to 103^b be distinguished. Now one way to confirm that the elements mentioned above are those out of which and through which and to which arguments proceed, is by induction: for if any one were to survey propositions and problems one by one, it would be seen that each was formed either from the 5 definition of something or from its property or from its genus or from its accident. Another way to confirm it is through reasoning. For every predicate of a subject must of necessity be either convertible with its subject or not: and if it is convertible, it would be its definition or property, for if it signifies the essence, it is the definition; if not, it is 10 a property: for this was² what a property is, viz. what is predicated convertibly, but does not signify the essence. If, on the other hand, it is not predicated convertibly of the thing, it either is or is not one of the terms contained in the definition of the subject: and if it be one of those terms, then it will be the genus or the differentia, inasmuch as the 15 definition consists of genus and differentiae; whereas, if it be not one of those terms, clearly it would be an accident, for accident was said³ to be what belongs as an attribute to a subject without being either its definition or its genus or a property.

9 Next, then, we must distinguish between the classes of 20 predicates in which the four orders in question are found. These are ten in number: Essence, Quantity, Quality, Relation, Place, Time, Position, State, Activity, Passivity. For the accident and genus and property and definition of anything will always be in one of these categories: for all 25 the propositions found through these signify either something's essence or its quality or quantity or some one of the other types of predicate. It is clear, too, on the face of it that the man who signifies something's essence signifies sometimes a substance, sometimes a quality, sometimes

¹ 107.² 102^a 18.³ 102^b 4.

some one of the other types of predicate. For when a man
 30 is set before him and he says that what is set there is 'a man'
 or 'an animal', he states its essence and signifies a substance;
 but when a white colour is set before him and he says that
 what is set there is 'white' or is 'a colour', he states its
 essence and signifies a quality. Likewise, also, if a magnitude
 of a cubit be set before him and he says that what is set there
 is a magnitude of a cubit, he will be describing its essence and
 35 signifying a quantity. Likewise, also, in the other cases:
 for each of these kinds of predicate, if either it be asserted
 of itself, or its genus be asserted of it, signifies an essence:
 if, on the other hand, one kind of predicate is asserted of
 another kind, it does not signify an essence, but a quantity
 or a quality or one of the other kinds of predicate. Such,
 then, and so many, are the subjects on which arguments
 104^a take place, and the materials with which they start. How
 we are to acquire them, and by what means we are to
 become well supplied with them, falls next to be told.

First, then, a definition must be given of a 'dialectical 10
 proposition' and a 'dialectical problem'. For it is not
 every proposition nor yet every problem that is to be set
 5 down as dialectical: for no one in his senses would make
 a proposition of what no one holds, nor yet make a problem
 of what is obvious to everybody or to most people: for the
 latter admits of no doubt, while to the former no one would
 assent. Now a dialectical proposition consists in asking
 something that is held by all men or by most men or by the
 philosophers, i.e. either by all, or by most, or by the most
 10 notable of these, provided it be not contrary to the general
 opinion; for a man would probably assent to the view of
 the philosophers, if it be not contrary to the opinions of most
 men. Dialectical propositions also include views which are
 like those generally accepted; also propositions which
 contradict the contraries of opinions that are taken to be
 generally accepted,¹ and also all opinions that are in accord-
 15 ance with the recognized arts. Thus, supposing it to be

¹ 104^a 13-14. Reading *τάναντία τοῖς δοκοῦσιν ἐνδόξοις εἶναι κατ' ἀντί-
 φασιν προτεινόμενα*.

a general opinion that the knowledge of contraries is the same, it might probably pass for a general opinion also that the perception of contraries is the same:¹ also, supposing it to be a general opinion that there is but one single science of grammar, it might pass for a general opinion that there is but one science of flute-playing as well, whereas, if it be a general opinion that there is more than one science of grammar, it might pass for a general opinion that there is more than one science of flute-playing as well: for all these seem to be alike and akin. 10 Likewise, also, propositions contradicting the contraries of general opinions will pass as general opinions: for if it be a general opinion that one ought to do good to one's friends, it will also be a general opinion that one ought not to do them harm. Here, that one ought to do harm to one's friends is contrary to the general view, and that one ought not to do them harm is the contradictory of that contrary. Likewise also, if one ought to do good to one's friends, one 25 ought not to do good to one's enemies: this too is the contradictory of the view contrary to the general view; the contrary being that one ought to do good to one's enemies. Likewise, also, in other cases. Also, on comparison, it will look like a general opinion that the contrary predicate belongs to the contrary subject: e.g. if one ought to do good to one's friends, one ought also to do evil to one's 30 enemies. It might appear also as if doing good to one's friends were a contrary to doing evil to one's enemies: but whether this is or is not so in reality as well will be stated in the course of the discussion upon contraries.² Clearly also, all opinions that are in accordance with the arts are dialectical propositions; for people are likely to assent to the views held by those who have made a study of these 35 things, e.g. on a question of medicine they will agree with the doctor, and on a question of geometry with the geometrician; and likewise also in other cases.

- II A dialectical problem is a subject of inquiry that con- 104^b
tributes either to choice and avoidance, or to truth and

¹ 104^a 16 f. Insert a comma after *ἐπιστήμην*, delete the comma after *ἐναντίον*, and read a colon after *φανερόν*.
² ii. 7.

knowledge, and that either by itself, or as a help to the solution of some other such problem. It must, moreover, be something on which either people hold no opinion either way, or the masses hold a contrary opinion to the philosophers, 5 or the philosophers to the masses, or each of them among themselves. For some problems it is useful to know with a view to choice or avoidance, e.g. whether pleasure is to be chosen or not, while some it is useful to know merely with a view to knowledge, e.g. whether the universe is eternal or not: others, again, are not useful in and by themselves for either of these purposes, but yet help us in regard to some 10 such problems; for there are many things which we do not wish to know in and by themselves, but for the sake of other things, in order that through them we may come to know something else. Problems also include questions in regard to which reasonings conflict (the difficulty then being whether so-and-so is so or not, there being convincing arguments for 15 both views); others also in regard to which we have no argument because they are so vast, and we find it difficult to give our reasons, e.g. the question whether the universe is eternal or no: for into questions of that kind too it is possible to inquire.

Problems, then, and propositions are to be defined as aforesaid.¹ A 'thesis' is a supposition of some eminent 20 philosopher that conflicts with the general opinion; e.g. the view that contradiction is impossible, as Antisthenes said; or the view of Heraclitus that all things are in motion; or that Being is one, as Melissus says: for to take notice when any ordinary person expresses views contrary to men's usual opinions would be silly. Or it may be a view about which we have a reasoned theory contrary to men's usual opinions, 25 e.g. the view maintained by the sophists that what is need not in every case either have come to be or be eternal: for a musician who is a grammarian 'is' so without ever having 'come to be' so, or being so eternally. For even if a man does not accept this view, he might do so on the ground that it is reasonable.

Now a 'thesis' also is a problem, though a problem is

¹ b 1, a 8.

not always a thesis, inasmuch as some problems are such 30 that we have no opinion about them either way. That a thesis, however, also forms a problem, is clear: for it follows of necessity from what has been said that either the mass of men disagree with the philosophers about the thesis, or that the one or the other class disagree among themselves, seeing that the thesis is a supposition in conflict with general opinion. Practically all dialectical problems indeed are now 35 called 'theses'. But it should make no difference whichever description is used; for our object in thus distinguishing them has not been to create a terminology, but to recognize what differences happen to be found between them. 105^a

Not every problem, nor every thesis, should be examined, but only one which might puzzle one of those who need argument, not punishment or perception. For people who 5 are puzzled to know whether one ought to honour the gods and love one's parents or not need punishment, while those who are puzzled to know whether snow is white or not need perception. The subjects should not border too closely upon the sphere of demonstration, nor yet be too far removed from it: for the former cases admit of no doubt, while the latter involve difficulties too great for the art of the trainer.

- 12 Having drawn these definitions, we must distinguish how 10 many species there are of dialectical arguments. There is on the one hand Induction, on the other Reasoning. Now what reasoning is has been said before:¹ induction is a passage from individuals to universals, e.g. the argument that supposing the skilled pilot is the most effective, and likewise the skilled charioteer, then in general the skilled 15 man is the best at his particular task. Induction is the more convincing and clear: it is more readily learnt by the use of the senses, and is applicable generally to the mass of men, though Reasoning is more forcible and effective against contradictory people.

- 13 The classes, then, of things about which, and of things out 20 of which, arguments are constructed, are to be distinguished

¹ 100^a 25.

in the way we have said before. The means whereby we are to become well supplied with reasonings¹ are four: (1) the securing of propositions; (2) the power to distinguish in how many senses a particular expression is used; (3) the discovery of the differences of things; (4) the investigation
 25 of likeness. The last three, as well, are in a certain sense propositions: for it is possible to make a proposition corresponding to each of them, e.g. (1) 'The desirable may mean either the honourable or the pleasant or the expedient'; and (2) 'Sensation differs from knowledge in that the latter may be recovered again after it has been lost, while the
 30 former cannot'; and (3) 'The relation of the healthy to health is like that of the vigorous to vigour'. The first proposition depends upon the use of one term in several senses, the second upon the differences of things, the third upon their likenesses.

Propositions should be selected in a number of ways¹⁴ corresponding to the number of distinctions drawn in regard
 35 to the proposition:² thus one may first take in hand the opinions held by all or by most men or by the philosophers, i.e. by all, or most, or the most notable of them; or opinions
 105^b contrary to those that seem to be generally held; and, again, all opinions that are in accordance with the arts. We must make propositions also of the contradictories of opinions contrary to those that seem to be generally held, as was laid down before. It is useful also to make them by selecting
 5 not only those opinions that actually are accepted, but also those that are like these, e.g. 'The perception of contraries is the same'—the knowledge of them being so—and 'we see by admission of something into ourselves, not by an emission'; for so it is, too, in the case of the other senses; for in hearing we admit something into ourselves; we do not emit; and we taste in the same way. Likewise also in the
 10 other cases. Moreover, all statements that seem to be true in all or in most cases, should be taken as a principle or accepted position; for they are posited by those who do not

¹ 105^a 22. Omit καὶ τῶν ἐπαγωγῶν.

² 104^a 8-15, and perhaps also ib. 28-30.

also see what exception there may be.¹ We should select also from the written handbooks of argument, and should draw up sketch-lists of them upon each several kind of subject, putting them down under separate headings, e.g. 'On Good', or 'On Life'—and that 'On Good' should deal 15 with every form of good, beginning with the category of essence. In the margin, too, one should indicate also the opinions of individual thinkers, e.g. 'Empedocles said that the elements of bodies were four': for any one might assent to the saying of some generally accepted authority.

Of propositions and problems there are—to comprehend the matter in outline—three divisions: for some are ethical 20 propositions, some are on natural philosophy, while some are logical. Propositions such as the following are ethical, e.g. 'Ought one rather to obey one's parents or the laws, if they disagree?'; such as this are logical, e.g. 'Is the knowledge of opposites the same or not?'; while such as this are on natural philosophy, e.g. 'Is the universe eternal or not?' 25 Likewise also with problems. The nature of each of the aforesaid kinds of proposition is not easily rendered in a definition, but we have to try to recognize each of them by means of the familiarity attained through induction, examining them in the light of the illustrations given above.

For purposes of philosophy we must treat of these things 30 according to their truth, but for dialectic only with an eye to general opinion. All propositions should be taken in their most universal form; then, the one should be made into many. E.g. 'The knowledge of opposites is the same'; next, 'The knowledge of contraries is the same', and that 'of relative terms'. In the same way these two should again be divided, as long as division is possible, e.g. the knowledge 35 of 'good and evil', of 'white and black', or 'cold and hot'. Likewise also in other cases.

- 15 On the formation, then, of propositions, the above remarks 106^a are enough. As regards the number of senses a term bears, we must not only treat of those terms which bear different senses, but we must also try to render their definitions;

¹ Reading in I. 12 ἐν τῷ λόγῳ.

e.g. we must not merely say that justice and courage are
 5 called 'good' in one sense, and that what conduces to vigour
 and what conduces to health are called so in another, but
 also that the former are so called because of a certain in-
 trinsic quality they themselves have, the latter because they
 are productive of a certain result and not because of any
 intrinsic quality in themselves. Similarly also in other cases.

Whether a term bears a number of specific meanings or
 10 one only, may be considered by the following means. First,
 look and see if its contrary bears a number of meanings,
 whether the discrepancy between them be one of kind or one
 of names. For in some cases a difference is at once displayed
 even in the names; e.g. the contrary of 'sharp' in the case
 of a note is 'flat', while in the case of a solid edge it is 'dull'.
 Clearly, then, the contrary of 'sharp' bears several meanings,
 15 and if so, so also does 'sharp'; for corresponding to each of
 the former terms the meaning of its contrary will be different.
 For 'sharp' will not be the same when contrary to 'dull'
 and to 'flat', though 'sharp' is the contrary of each. Again
βαρύ ('flat', 'heavy') in the case of a note has 'sharp' as
 its contrary, but in the case of a solid mass 'light', so that
βαρύ is used with a number of meanings, inasmuch as its
 20 contrary also is so used. Likewise, also, 'fine' as applied
 to a picture has 'ugly' as its contrary, but, as applied to
 a house, 'ramshackle'; so that 'fine' is an ambiguous term.

In some cases there is no discrepancy of any sort in the
 names used, but a difference of kind between the meanings
 is at once obvious: e.g. in the case of 'clear' and
 25 'obscure'¹: for sound is called 'clear' and 'obscure', just
 as 'colour' is too. As regards the names, then, there is no
 discrepancy, but the difference in kind between the meanings
 is at once obvious: for colour is not called 'clear' in a like
 sense to sound. This is plain also through sensation: for
 of things that are the same in kind we have the same
 30 sensation, whereas we do not judge clearness by the same
 sensation in the case of sound and of colour, but in the
 latter case we judge by sight, in the former by hearing.
 Likewise also with 'sharp' and 'dull' in regard to flavours

¹ Lit. 'white' (*λευκός*) and 'black' (*μέλας*).

and solid edges : here in the latter case we judge by touch, but in the former by taste. For here again there is no discrepancy in the names used, in the case either of the original terms or of their contraries : for the contrary also 35 of sharp in either sense is 'dull'.

Moreover, see if one sense of a term has a contrary, while another has absolutely none ; e.g. the pleasure of drinking has a contrary in the pain of thirst, whereas the pleasure of seeing that the diagonal is incommensurate with the side has none, so that 'pleasure' is used in more than 106^b one sense. To 'love' also, used of the frame of mind, has to 'hate' as its contrary, while as used of the physical activity (kissing) it has none : clearly, therefore, to 'love' is an ambiguous term. Further, see in regard to their intermediates, if some meanings and their contraries have an intermediate, while others have none, or if both have 5 one but not the same one, as e.g. 'clear' and 'obscure' in the case of colours have 'grey' as an intermediate, whereas in the case of sound they have none, or, if they have, it is 'harsh', as some people say that a harsh sound is intermediate. 'Clear', then, is an ambiguous term, and likewise also 'obscure'. See, moreover, if some of them have more than one intermediate, while others have but one, as is the 10 case with 'clear' and 'obscure', for in the case of colours there are numbers of intermediates, whereas in regard to sound there is but one, viz. 'harsh'.

Again, in the case of the contradictory opposite, look and see if it bears more than one meaning. For if this bears more than one meaning, then the opposite of it also will be used 15 in more than one meaning ; e.g. 'to fail to see' is a phrase with more than one meaning, viz. (1) to fail to possess the power of sight, (2) to fail to put that power to active use. But if this has more than one meaning, it follows necessarily that 'to see' also has more than one meaning : for there will be an opposite to each sense of 'to fail to see' ; e.g. the opposite of 'not to possess the power of sight' is to possess it, while of 'not to put the power of sight to active 20 use', the opposite is to put it to active use.

Moreover, examine the case of terms that denote the

privation or presence of a certain state: for if the one term bears more than one meaning, then so will the remaining term: e.g. if 'to have sense' be used with more than one meaning, as applied to the soul and to the body, then 'to be wanting in sense' too will be used with more than one
 25 meaning, as applied to the soul and to the body. That the opposition between the terms now in question depends upon the privation or presence of a certain state is clear, since animals naturally possess each kind of 'sense', both as applied to the soul and as applied to the body.

Moreover, examine the inflected forms. For if 'justly'
 30 has more than one meaning, then 'just', also, will be used with more than one meaning; for there will be a meaning of 'just' corresponding to each of the meanings of 'justly'; e.g. if the word 'justly' be used of judging according to one's own opinion, and also of judging as one ought, then 'just' also will be used in like manner. In the same way also, if 'healthy' has more than one meaning, then 'healthily' also will be used with more than one meaning:
 35 e.g. if 'healthy' describes both what produces health and what preserves health and what betokens health, then 'healthily' also will be used to mean 'in such a way as to produce' or 'preserve' or 'betoken' health. Likewise also in other cases, whenever the original term bears more
 107^a than one meaning, the inflexion also that is formed from it will be used with more than one meaning, and vice versa.

Look also at the classes of the predicates signified by the term, and see if they are the same in all cases. For if they
 5 are not the same, then clearly the term is ambiguous: e.g. 'good' in the case of food means 'productive of pleasure', and in the case of medicine 'productive of health', whereas as applied to the soul it means to be of a certain quality, e.g. temperate or courageous or just: and likewise also, as applied to 'man'. Sometimes it signifies what happens at a certain time, as (e.g.) the good that happens at the right time: for what happens at the right time is called good.
 10 Often it signifies what is of a certain quantity, e.g. as applied to the proper amount: for the proper amount too is called good. So then the term 'good' is ambiguous.

In the same way also 'clear', as applied to a body, signifies a colour, but in regard to a note it denotes what is 'easy to hear'. 'Sharp', too, is in a closely similar case: for the same term does not bear the same meaning in all its applications: for a sharp note is a swift note, as the 15 mathematical theorists of harmony tell us, whereas a sharp (acute) angle is one that is less than a right angle, while a sharp dagger is one containing a sharp angle (point).

Look also at the genera of the objects denoted by the same term, and see if they are different without being subaltern, as (e.g.) 'donkey', which denotes both the animal and the engine. For the definition of them that corre- 20 sponds to the name is different: for the one will be declared to be an animal of a certain kind, and the other to be an engine of a certain kind. If, however, the genera be subaltern, there is no necessity for the definitions to be different. Thus (e.g.) 'animal' is the genus of 'raven', and so is 'bird'. Whenever therefore we say that the raven is a bird, we also say that it is a certain kind of animal, so 25 that both the genera are predicated of it. Likewise also whenever we call the raven a 'flying biped animal', we declare it to be a bird: in this way, then, as well, both the genera are predicated of raven, and also their definition. But in the case of genera that are not subaltern this does not happen, for whenever we call a thing an 'engine', we 30 do not call it an animal, nor vice versa.

Look also and see not only if the genera of the term before you are different without being subaltern, but also in the case of its contrary: for if its contrary bears several senses, clearly the term before you does so as well. 35

It is useful also to look at the definition that arises from the use of the term in combination, e.g. of a 'clear (*lit.* white) body' and of a 'clear note'. For then if what is peculiar in each case be abstracted, the same expression ought to remain over. This does not happen in the case of ambiguous terms, e.g. in the cases just mentioned. For 107^b the former will be 'a body possessing such and such a colour', while the latter will be 'a note easy to hear'. Abstract, then, 'a body' and 'a note', and the remainder in

each case is not the same. It should, however, have been
 5 had the meaning of 'clear' in each case been synonymous.

Often in the actual definitions as well ambiguity creeps
 in unawares, and for this reason the definitions also should
 be examined. If (e.g.) any one describes what betokens and
 what produces¹ health as 'related commensurably to
 health', we must not desist but go on to examine in what
 10 sense he has used the term 'commensurably' in each case,
 e.g. if in the latter case it means that 'it is of the
 right amount² to produce health', whereas in the former it
 means that 'it is such as to betoken what kind of state
 prevails'.

Moreover, see if the terms cannot be compared as 'more
 or less' or as 'in like manner', as is the case (e.g.) with
 a 'clear' (*lit.* white) sound and a 'clear' garment, and a
 15 'sharp' flavour and a 'sharp' note. For neither are these
 things said to be clear or sharp 'in a like degree', nor yet
 is the one said to be clearer or sharper than the other.
 'Clear', then, and 'sharp' are ambiguous. For synonyms
 are always comparable; for they will always be used
 either in like manner, or else in a greater degree in one
 case.

Now since of genera that are different without being
 20 subaltern the differentiae also are different in kind, e.g.
 those of 'animal' and 'knowledge' (for the differentiae of
 these are different), look and see if the meanings com-
 prised under the same term are differentiae of genera that
 are different without being subaltern, as e.g. 'sharp' is of
 a 'note' and a 'solid'. For being 'sharp' differentiates
 note from note, and likewise also one solid from another.
 25 'Sharp', then, is an ambiguous term: for it forms differen-
 tiaie of genera that are different without being subaltern.

Again, see if the actual meanings included under the
 same term themselves have different differentiae, e.g.
 'colour' in bodies and 'colour' in tunes: for the differentiae
 of 'colour' in bodies are 'sight-piercing' and 'sight-com-
 30 pressing', whereas 'colour' in melodies has not the same

¹ 107^b 8. Read καὶ τὸ ποιητικόν.

² 107^b 11. Read τὸ τοσούτον εἶναι . . .

differentiae. Colour, then, is an ambiguous term ; for things that are the same have the same differentiae.

Moreover, since the species is never the differentia of anything, look and see if one of the meanings included under the same term be a species and another a differentia, as (e.g.) 'clear' (*lit.* white) as applied to a body is a species 35 of colour, whereas in the case of a note it is a differentia ; for one note is differentiated from another by being 'clear'.

- 16 The presence, then, of a number of meanings in a term may be investigated by these and like means. The differences which things present to each other should be examined within the same genera,¹ e.g. 'Wherein does justice differ from courage, and wisdom from temperance?'— 108^a for all these belong to the same genus ; and also from one genus to another, provided they be not very much too far apart, e.g. 'Wherein does sensation differ from knowledge?' : for in the case of genera that are very far apart, 5 the differences are entirely obvious.

- 17 Likeness should be studied, first, in the case of things belonging to different genera, the formulæ being 'A : B = C : D' (e.g. as knowledge stands to the object of knowledge, so is sensation related to the object of sensation), and 'As A is in B, so is C in D' (e.g. as sight is in the eye, 10 so is reason in the soul, and as is a calm in the sea, so is windlessness in the air). Practice is more especially needed in regard to terms that are far apart ; for in the case of the rest, we shall be more easily able to see in one glance the points of likeness. We should also look at things which belong to the same genus, to see if any identical 15 attribute belongs to them all, e.g. to a man and a horse and a dog ; for in so far as they have any identical attribute, in so far they are alike.

- 18 It is useful to have examined the number of meanings of a term both for clearness' sake (for a man is more likely to know what it is he asserts, if it has been made clear to

¹ 107^b 39. Read *ἐν τοῖς αὐτοῖς γένεσι*.

20 him how many meanings it may have), and also with a view to ensuring that our reasonings shall be in accordance with the actual facts and not addressed merely to the term used. For as long as it is not clear in how many senses a term is used, it is possible that the answerer and the questioner are not directing their minds upon the same thing: whereas when once it has been made clear how many meanings there are, and also upon which of them the former directs
25 his mind when he makes his assertion, the questioner would then look ridiculous if he failed to address his argument to this. It helps us also both to avoid being misled and to mislead by false reasoning: for if we know the number of meanings of a term, we shall certainly never be misled by false reasoning, but shall know if the questioner fails to address his argument to the same point; and when we ourselves put the questions we shall be able to mislead him, if
30 our answerer happens not to know the number of meanings of our terms. This, however, is not possible in all cases, but only when of the many senses some are true and others are false. This manner of argument, however, does not belong properly to dialectic; dialecticians should therefore
35 by all means beware of this kind of verbal discussion, unless any one is absolutely unable to discuss the subject before him in any other way.

The discovery of the differences of things helps us both in reasonings about sameness and difference, and also in
108^b recognizing what any particular thing is. That it helps us in reasoning about sameness and difference is clear: for when we have discovered a difference of any kind whatever between the objects before us, we shall already have shown that they are not the same: while it helps us in recognizing what a thing is, because we usually distinguish the expression that is proper to the essence of each particular thing
5 by means of the differentiae that are proper to it.

The examination of likeness is useful with a view both to inductive arguments and to hypothetical reasonings, and also with a view to the rendering of definitions. It is useful
10 for inductive arguments, because it is by means of an induction of individuals in cases that are alike that we claim

to bring the universal in evidence : for it is not easy to do this if we do not know the points of likeness. It is useful for hypothetical reasonings because it is a general opinion that among similars what is true of one is true also of the rest. If, then, with regard to any of them we are well supplied with matter for a discussion, we shall secure a preliminary admission that however it is in these cases, so it is also in the case before us : then when we have shown the former we shall have shown, on the strength of the hypothesis, the matter before us as well : for we have first made the hypothesis that however it is in these cases, so it is also in the case before us, and have then proved the point as regards these cases. It is useful for the rendering of definitions because, if we are able to see in one glance what is the same in each individual case of it, we shall be at no loss into what genus we ought to put the object before us when we define it : for of the common predicates that which is most definitely in the category of essence is likely to be the genus. Likewise, also, in the case of objects widely divergent, the examination of likeness is useful for purposes of definition, e. g. the sameness of a calm at sea, and windlessness in the air (each being a form of rest), and of a point on a line and the unit in number—each being a starting point. If, then, we render as the genus what is common to all the cases, we shall get the credit of defining not inappropriately. Definition-mongers too nearly always render them in this way : for they declare the unit to be the starting-point of number, and the point the starting-point of a line. It is clear, then, that they place them in that which is common to both as their genus.

The means, then, whereby reasonings are effected, are these : the commonplace rules, for the observance of which the aforesaid means are useful, are as follows.

BOOK II

168^b

37 OF problems some are universal, others particular. 1
Universal problems are such as 'Every pleasure is good' and
'No pleasure is good'; particular problems are such as 'Some
109^a pleasure is good' and 'Some pleasure is not good'. The
methods of establishing and overthrowing a view universally
are common to both kinds of problems; for when we have
shown that a predicate belongs in every case, we shall also
have shown that it belongs in some cases. Likewise, also,
5 if we show that it does not belong in any case, we shall also
have shown that it does not belong in every case. First,
then, we must speak of the methods of overthrowing
a view universally, because such are common to both
universal and particular problems, and because people more
usually introduce theses asserting a predicate than denying it,
10 while those who argue with them overthrow it. The
conversion of an appropriate name which is drawn from the
element 'accident' is an extremely precarious thing; for in
the case of accidents and in no other it is possible for
something to be true conditionally and not universally.
Names drawn from the elements 'definition' and 'property'
and 'genus' are bound to be convertible; e.g. if 'to be an
animal that walks on two feet is an attribute of S', then it
15 will be true by conversion to say that 'S is an animal that
walks on two feet'. Likewise, also, if drawn from the genus;
for if 'to be an animal is an attribute of S', then 'S is an
animal'. The same is true also in the case of a property;
for if 'to be capable of learning grammar is an attribute of
S', then 'S will be capable of learning grammar'. For none
20 of these attributes can possibly belong or not belong in part;
they must either belong or not belong absolutely. In the
case of accidents, on the other hand, there is nothing
to prevent an attribute (e.g. whiteness or justice) belonging
in part, so that it is not enough to show that whiteness or

justice is an attribute of a man in order to show that he is white or just; for it is open to dispute it and say that he is white or just in part only. Conversion, then, is not a necessary process in the case of accidents.

We must also define the errors that occur in problems. They are of two kinds, caused either by false statement or by transgression of the established diction. For those who make false statements, and say that an attribute belongs to a thing which does not belong to it, commit error; and those who call objects by the names of other objects (e.g. calling a plane-tree a 'man') transgress the established terminology.

- 2 Now one commonplace rule is to look and see if a man has ascribed as an accident what belongs in some other way. This mistake is most commonly made in regard to the genera of things, e. g. if one were to say that white happens (*accidit*) to be a colour—for being a colour does not happen by accident to white, but colour is its genus. The assertor may of course define it so in so many words, saying (e. g.) that 'Justice happens (*accidit*) to be a virtue'; but often even without such definition it is obvious that he has rendered the genus as an accident; e.g. suppose that one were to say that whiteness is coloured or that walking is in motion. For a predicate drawn from the genus is never ascribed to the species in an inflected form, but always the genera are predicated of their species literally; for the species take on both the name and the definition of their genera. A man therefore who says that white is 'coloured' has not rendered 'coloured' as its genus, seeing that he has used an inflected form, nor yet as its property or as its definition: for the definition and property of a thing belong to it and to nothing else, whereas many things besides white are coloured, e. g. a log, a stone, a man, and a horse. Clearly then he renders it as an accident.

Another rule is to examine all cases where a predicate has been either asserted or denied universally to belong to something. Look at them species by species, and not in their infinite multitude: for then the inquiry will proceed

- more directly and in fewer steps. You should look and begin with the most primary groups, and then proceed in order down to those that are not further divisible: e. g. if a man has said that the knowledge of opposites is the same, you should look and see whether it be so of relative opposites and of contraries and of terms signifying the privation or presence of certain states, and of contradictory
 20 terms. Then, if no clear result be reached so far in these cases, you should again divide these until you come to those that are not further divisible, and see (e. g.) whether it be so of just deeds and unjust, or of the double and the half, or of blindness and sight, or of being and not-being: for if in any case it be shown that the knowledge of them is not the same we shall have demolished the problem.¹ Likewise, also, if
 25 the predicate belongs in no case. This rule is convertible for both destructive and constructive purposes: for if, when we have suggested a division, the predicate appears to hold in all or in a large number of cases, we may then claim that the other should actually assert it universally, or else bring a negative instance to show in what case it is not so: for if he does neither of these things, a refusal to assert it will make him look absurd.
- 30 Another rule is to make definitions both of an accident and of its subject, either of both separately or else of one of them, and then look and see if anything untrue has been assumed as true in the definitions. Thus (e. g.) to see if it is possible to wrong a god, ask what is 'to wrong'? For if it be 'to injure deliberately', clearly it is not possible for a
 35 god to be wronged: for it is impossible that God should be injured. Again, to see if the good man is jealous, ask who is the 'jealous' man and what is 'jealousy'. For if 'jealousy' is pain at the apparent success of some well-behaved person, clearly the good man is not jealous: for then he would be bad. Again, to see if the indignant man is jealous, ask who each of them is: for then it will
 40 be obvious whether the statement is true or false; e. g. if he is 'jealous' who grieves at the successes of the good, and he is 'indignant' who grieves at the successes of the evil, then

¹ 109^b 23-4. Read a colon at *εἶναι*, and a full stop at *πρόβλημα*.

clearly the indignant man would not be jealous. A man should substitute definitions also for the terms contained in 5 his definitions, and not stop until he comes to a familiar term : for often if the definition be rendered whole, the point at issue is not cleared up, whereas if for one of the terms used in the definition a definition be stated, it becomes obvious.

Moreover, a man should make the problem into a propo- 10 sition for himself, and then bring a negative instance against it: for the negative instance will be a ground of attack upon the assertion. This rule is very nearly the same as the rule to look into cases where a predicate has been attributed or denied universally: but it differs in the turn of the argument.

Moreover, you should define what kind of things should be called as most men call them, and what should not. For 15 this is useful both for establishing and for overthrowing a view: e.g. you should say that we ought to use our terms to mean the same things as most people mean by them, but when we ask what kind of things are or are not of such and such a kind, we should not here go with the multitude: e.g. it is right to call 'healthy' whatever tends to produce health, as do most men: but in saying whether 20 the object before us tends to produce health or not, we should adopt the language no longer of the multitude but of the doctor.

- 3 Moreover, if a term be used in several senses, and it has been laid down that it is or that it is not an attribute of S, you should show your case of one of its several senses, if 25 you cannot show it of both. This rule is to be observed in cases where the difference of meaning is undetected; for supposing this to be obvious, then the other man will object that the point which he himself questioned has not been discussed, but only the other point. This commonplace rule is convertible for purposes both of establishing and of overthrowing a view. For if we want to establish a state-
ment, we shall show that in one sense the attribute belongs, 30 if we cannot show it of both senses: whereas if we are overthrowing a statement, we shall show that in one sense

the attribute does not belong, if we cannot show it of both senses. Of course, in overthrowing a statement there is no need to start the discussion by securing any admission, either when the statement asserts or when it denies the attribute universally: for if we show that in any case
 35 whatever the attribute does not belong, we shall have demolished the universal assertion of it, and likewise also if we show that it belongs in a single case, we shall demolish the universal denial of it. Whereas in establishing a statement we ought to secure a preliminary admission that if it belongs in any case whatever, it belongs universally, supposing this claim to be a plausible one. For it is not
 110^b enough to discuss a single instance in order to show that an attribute belongs universally; e.g. to argue that if the soul of man be immortal, then every soul is immortal, so that a previous admission must be secured that if any soul whatever be immortal, then every soul is immortal. This is not to be done in every case, but only whenever we are
 5 not easily able to quote any single argument applying to all cases in common, as (e.g.) the geometrician can argue that the triangle has its angles equal to two right angles.

If, again, the variety of meanings of a term be obvious, distinguish how many meanings it has before proceeding either to demolish or to establish it: e.g. supposing 'the
 10 right' to mean 'the expedient' or 'the honourable', you should try either to establish or to demolish both descriptions of the subject in question; e.g. by showing that it is honourable and expedient, or that it is neither honourable nor expedient. Supposing, however, that it is impossible to show both, you should show the one, adding an indication that it is true in the one sense and not in the other. The same rule applies also when the number of senses into
 15 which it is divided is more than two.

Again, consider those expressions whose meanings are many, but differ not by way of ambiguity of a term, but in some other way: e.g. 'The science of many things is one': here 'many things' may mean the end and the means to that end, as (e.g.) medicine is the science both of producing health and of dieting; or they may be both of them ends,

as the science of contraries is said to be the same (for of 20
 contraries the one is no more an end than the other);
 or again they may be an essential and an accidental attribute,
 as (e.g.) the essential fact that the triangle has its angles
 equal to two right angles, and the accidental fact that
 the equilateral figure has them so: for it is because
 of the accident of the equilateral triangle happening
 to be a triangle¹ that we know that it has its angles 25
 equal to two right angles. If, then, it is not possible
 in any sense of the term that the science of many things
 should be the same, it clearly is altogether impossible
 that it should be so; or, if it is possible in some sense, then
 clearly it is possible. Distinguish as many meanings as are
 required: e.g. if we want to establish a view, we should
 bring forward all such meanings as admit that view, and
 should divide them only into those meanings which also are 30
 required for the establishment of our case: whereas if we
 want to overthrow a view, we should bring forward all that
 do not admit that view, and leave the rest aside. We must
 deal also in these cases as well with any uncertainty about
 the number of meanings involved. Further, that one thing
 is, or is not, 'of' another should be established by means
 of the same commonplace rules; e.g. that a particular
 science is of a particular thing, treated either as an end or as 35
 a means to its end, or as accidentally connected with it; or
 again that it is not 'of' it² in any of the aforesaid ways.
 The same rule holds true also of desire and all other terms
 that have more than one object. For the 'desire of X' may
 mean the desire of it as an end (e.g. the desire of health) or 111^a
 as a means to an end (e.g. the desire of being doctored), or
 as a thing desired accidentally, as, in the case of wine, the
 sweet-toothed person desires it not because it is wine but
 because it is sweet. For essentially he desires the sweet,
 and only accidentally the wine: for if it be dry, he no³
 longer desires it. His desire for it is therefore accidental.
 This rule is useful in dealing with relative terms: for cases
 of this kind are generally cases of relative terms.

¹ 110^b 24. Read *ἔτι γὰρ συμβέβηκε τῷ ἴσοπλεύρῳ τριγώνῳ τριγώνῳ εἶναι*.

² 110^b 36. Omit *τι* after *εἶναι* (with C).

Moreover, it is well to alter a term into one more familiar, 4
e. g. to substitute 'clear' for 'exact' in describing a concep-
tion, and 'being fussy' for 'being busy': for when the expres-
sion is made more familiar, the thesis becomes easier to attack.
This commonplace rule also is available for both purposes
alike, both for establishing and for overthrowing a view.

In order to show that contrary attributes belong to the
15 same thing, look at its genus; e. g. if we want to show that
rightness and wrongness are possible in regard to perception,
and to perceive is to judge, while it is possible to judge
rightly or wrongly, then in regard to perception as well
rightness and wrongness must be possible. In the present
instance the proof proceeds from the genus and relates to
the species: for 'to judge' is the genus of 'to perceive'; for
20 the man who perceives judges in a certain way. But *per*
contra it may proceed from the species to the genus: for all
the attributes that belong to the species belong to the genus
as well; e. g. if there is a bad and a good knowledge there
is also a bad and a good disposition: for 'disposition' is the
genus of knowledge. Now the former commonplace argu-
ment is fallacious for purposes of establishing a view, while
25 the second is true. For there is no necessity that all
the attributes that belong to the genus should belong also to
the species; for 'animal' is flying and quadruped, but not
so 'man'. All the attributes, on the other hand, that
belong to the species must of necessity belong also to the
genus; for if 'man' is good, then animal also is good. On
the other hand, for purposes of overthrowing a view, the
30 former argument is true while the latter is fallacious; for all
the attributes which do not belong to the genus do not belong
to the species either; whereas all those that are wanting
to the species are not of necessity wanting to the genus.

Since those things of which the genus is predicated must
also of necessity have one of its species predicated of them,
and since those things that are possessed of the genus
35 in question, or are described by terms derived from that
genus, must also of necessity be possessed of one of its
species or be described by terms derived from one of its
species (e. g. if to anything the term 'scientific knowledge'

be applied, then also there will be applied to it the term 'grammatical' or 'musical' knowledge, or knowledge of one of the other sciences; and if any one possesses scientific knowledge or is described by a term derived from 'science', III^b then he will also possess grammatical or musical knowledge or knowledge of one of the other sciences, or will be described by a term derived from one of them, e.g. as a 'grammarian' or a 'musician')¹—therefore if any expression be asserted that is in any way derived from the genus (e.g. that the soul is in motion), look and see whether it be possible for the soul to be moved with any of the species of motion; whether (e.g.) it can grow or be destroyed or come to be, and so forth with all the other species of motion. For if it be not moved in any of these ways, clearly it does not move at all. This commonplace rule is common for both purposes, both for overthrowing and for establishing a view: for if the soul moves with one of the species of motion, clearly it does move; while if it does not move with any of the species of motion, clearly it does not move.

If you are not well equipped with an argument against the assertion, look among the definitions, real or apparent, of the thing before you, and if² one is not enough, draw upon several. For it will be easier to attack people when they are committed to a definition: for an attack is always more easily made on definitions.

Moreover, look and see in regard to the thing in question, what it is whose reality conditions the reality of the thing in question, or what it is whose reality necessarily follows if the thing in question be real: if you wish to establish a view inquire what there is on whose reality the reality of the thing in question will follow (for if the former be shown to be real, then the thing in question will also have been shown to be real); while if you want to overthrow a view, ask what it is that is real if the thing in question be real, for if we show that what follows from the thing in question is unreal, we shall have demolished the thing in question.

¹ Read a colon or comma instead of a full stop at μουσικός (111^b 4), and for clearness put 111^a 36 οὐκ ἐστὶν ἐν . . . 111^b 4 μουσικός (consisting as it does wholly of illustrations), in a parenthesis.

² Read καὶ ἐν for καὶ, with Vaticanus 207.

Moreover, look at the time involved, to see if there be any
 25 discrepancy anywhere: e.g. suppose a man to have stated
 that what is being nourished of necessity grows: for animals
 are always of necessity being nourished, but they do not
 always grow. Likewise, also, if he has said that knowing
 is remembering: for the one is concerned with past time,
 whereas the other has to do also with the present and the
 future. For we are said to know things present and future
 30 (e.g. that there will be an eclipse), whereas it is impossible
 to remember anything save what is in the past.

Moreover, there is the sophistic turn of argument, where- 5
 by we draw our opponent into the kind of statement against
 which we shall be well supplied with lines of argument.
 This process is sometimes a real necessity, sometimes an
 apparent necessity, sometimes neither an apparent nor a real
 35 necessity. It is really necessary whenever the answerer
 has denied any view that would be useful in attacking
 the thesis, and the questioner thereupon addresses his argu-
 ments to the support of this view, and when moreover
 the view in question happens to be one of a kind on
 which he has a good stock of lines of argument. Likewise,
 also, it is really necessary whenever he (the questioner) first,
 42^a by an induction made by means of the view laid down,¹
 arrives at a certain statement and then tries to demolish
 that statement: for when once this has been demolished, the
 view originally laid down is demolished as well. It is an
 apparent necessity, when the point to which the discussion
 comes to be directed appears to be useful, and relevant
 to the thesis, without being really so; whether it be that
 5 the man who is standing up to the argument has refused to
 concede something, or whether he (the questioner) has first
 reached it by a plausible induction based upon the thesis²
 and then tries to demolish it. The remaining case is when
 the point to which the discussion comes to be directed
 is neither really nor apparently necessary, and it is the
 answerer's luck to be confuted on a mere side issue. You
 10 should beware of the last of the aforesaid methods; for it

¹ *Sc.* by the 'answerer'.

² *Sc.* of the 'answerer'.

appears to be wholly disconnected from, and foreign to, the art of dialectic. For this reason, moreover, the answerer should not lose his temper, but assent to those statements that are of no use in attacking the thesis, adding an indication whenever he assents although he does not agree with the view. For, as a rule, it increases the confusion of questioners if, after all propositions of this kind have been 15 granted them, they can then draw no conclusion.

Moreover, any one who has made any statement whatever has in a certain sense made several statements, inasmuch as each statement has a number of necessary consequences : e. g. the man who said ' X is a man ' has also said that it is an animal and that it is animate and a biped and capable of acquiring reason and knowledge, so that by the demolition 20 of any single one of these consequences, of whatever kind, the original statement is demolished as well. But you should beware here too of making a change to a more difficult subject : for sometimes the consequence, and sometimes the original thesis, is the easier to demolish.

- 6 In regard to subjects which must have one and one only of two predicates, as (e. g.) a man must have either a disease 25 or health, supposing we are well supplied as regards the one for arguing its presence or absence, we shall be well equipped as regards the remaining one as well. This rule is convertible for both purposes : for when we have shown that the one attribute belongs, we shall have shown that the remaining one does not belong ; while if we show that the one does not belong, we shall have shown that the remaining one does 30 belong. Clearly then the rule is useful for both purposes.

Moreover, you may devise a line of attack by reinterpreting a term in its literal meaning, with the implication that it is most fitting so to take it rather than in its established meaning : e. g. the expression ' strong at heart ' will suggest not the courageous man, according to the use now established, but the man the state of whose heart is strong ; just as also 35 the expression ' of a good hope ' may be taken to mean the man who hopes for good things. Likewise also ' well-starred ' may be taken to mean the man whose star is good, as

Xenocrates says 'well-starred is he who has a noble soul'.¹
For a man's star is his soul.

112^b Some things occur of necessity, others usually, others however it may chance; if therefore a necessary event has been asserted to occur usually, or if a usual event (or, failing such an event itself, its contrary) has been stated to occur of necessity, it always gives an opportunity for attack. For 5 if a necessary event has been asserted to occur usually, clearly the speaker has denied an attribute to be universal which is universal, and so has made a mistake: and so he has if he has declared the usual attribute to be necessary: for then he declares it to belong universally when it does not so belong. Likewise also if he has declared the contrary 10 of what is usual to be necessary. For the contrary of a usual attribute is always a comparatively rare attribute: e.g. if men are usually bad, they are comparatively seldom good, so that his mistake is even worse if he has declared them to be good of necessity. The same is true also if he has declared a mere matter of chance to happen of necessity or 15 usually; for a chance event happens neither of necessity nor usually. If the thing happens usually, then even supposing his statement does not distinguish whether he meant that it happens usually or that it happens necessarily, it is open to you to discuss it on the assumption that he meant that it happens necessarily: e.g. if he has stated without any distinction that disinherited persons are bad, you may 20 assume in discussing it that he means that they are so necessarily.

Moreover, look and see also if he has stated a thing to be an accident of itself, taking it to be a different thing because it has a different name, as Prodicus used to divide pleasures into joy and delight and good cheer: for all these are names of the same thing, to wit, Pleasure. If then any one says 25 that joyfulness is an accidental attribute of cheerfulness, he would be declaring it to be an accidental attribute of itself.

Inasmuch as contraries can be conjoined with each other 7 in six ways, and four of these conjunctions constitute a con-

¹ Fr. 81 Heinze.

trariety, we must grasp the subject of contraries, in order that it may help us both in demolishing and in establishing a view. Well then, that the modes of conjunction are six ³⁰ is clear: for either (1) each of the contrary verbs will be conjoined to each of the contrary objects; and this gives two modes: e.g. to do good to friends and to do evil to enemies, or *per contra* to do evil to friends and to do good to enemies. Or else (2) both verbs may be attached to one object; and this too gives two modes, e.g. to do good to friends and to ³⁵ do evil to friends, or to do good to enemies and to do evil to enemies.¹ Or (3) a single verb may be attached to both objects: and this also gives two modes; e.g. to do good to friends and to do good to enemies, or to do evil to friends and evil to enemies.

The first two then of the aforesaid conjunctions do not ^{113^a} constitute any contrariety; for the doing of good to friends is not contrary to the doing of evil to enemies: for both courses are desirable and belong to the same disposition. Nor is the doing of evil to friends contrary to the doing of good to enemies: for both of these are objectionable and ⁵ belong to the same disposition: and one objectionable thing is not generally thought to be the contrary of another, unless the one be an expression denoting an excess, and the other an expression denoting a defect: for an excess is generally thought to belong to the class of objectionable things, and likewise also a defect. But the other four all constitute a contrariety. For to do good to friends is contrary to the ¹⁰ doing of evil to friends: for it proceeds from the contrary disposition, and the one is desirable, and the other objectionable. The case is the same also in regard to the other conjunctions: for in each combination the one course is desirable, and the other objectionable, and the one belongs to a reasonable disposition and the other to a bad. Clearly, then, from what has been said, the same course has more ¹⁵ than one contrary. For the doing of good to friends has as its contrary both the doing of good to enemies and the doing of evil to friends. Likewise, if we examine them in the same way, we shall find that the contraries of each of the

¹ 112^b 36. Read καὶ τὸ τοὺς ἔχθρους κακῶς (with C).

others also are two in number. Select therefore whichever of the two contraries is useful in attacking the thesis.

- 20 Moreover, if the accident of a thing have a contrary, see whether it belongs to the subject to which the accident in question has been declared to belong: for if the latter belongs the former could not belong; for it is impossible that contrary predicates should belong at the same time to the same thing.

Or again, look and see if anything has been said about something, of such a kind that if it be true, contrary predicates must necessarily belong to the thing: e.g. if he has
25 said that the 'Ideas,' exist in us. For then the result will be that they are both in motion and at rest, and moreover that they are objects both of sensation and of thought. For according to the views of those who posit the existence of Ideas, those Ideas are at rest and are objects of thought; while if they exist in us, it is impossible that they should be unmoved: for when we move, it follows necessarily that
30 all that is in us moves with us as well. Clearly also they are objects of sensation, if they exist in us: for it is through the sensation of sight that we recognize the Form present in each individual.

Again, if there be posited an accident which has a contrary, look and see if that which admits of the accident will admit of its contrary as well: for the same thing admits of con-
35 traries. Thus (e.g.) if he has asserted that hatred follows anger, hatred would in that case be in the 'spirited faculty':
113^b for that is where anger is. You should therefore look and see if its contrary, to wit, friendship, be also in the 'spirited faculty': for if not—if friendship is in the faculty of desire—then hatred could not follow anger. Likewise also if he has asserted that the faculty of desire is ignorant. For if
5 it were capable of ignorance, it would be capable of knowledge as well: and this is not generally held—I mean that the faculty of desire is capable of knowledge. For purposes, then, of overthrowing a view, as has been said, this rule should be observed: but for purposes of establishing one, though the rule will not help you to assert that the accident actually belongs, it will help you to assert that it may possibly

belong. For having shown that the thing in question will not admit of the contrary of the accident asserted, we shall have shown that the accident neither belongs nor can possibly 10 belong; while on the other hand, if we show that the contrary belongs, or that the thing is capable of the contrary, we shall not indeed as yet have shown that the accident asserted does belong as well; our proof will merely have gone to this point, that it is possible for it to belong.

- 8 Seeing that the modes of opposition are four in number, 13 you should look for arguments among the contradictories of your terms, converting the order of their sequence, both when demolishing and when establishing a view, and you should secure them by means of induction—such arguments (e.g.) as that 'If man be an animal, what is not an animal is not a man': and likewise also in other instances of contradictories. For in those cases the sequence is converse: 15 for 'animal' follows upon 'man', but 'not-animal' does not follow upon 'not-man', but conversely 'not-man' upon 'not-animal'. In all cases, therefore, a postulate of this sort should be made, (e.g.) that 'If the honourable is pleasant, what is not pleasant is not honourable, while if the latter be untrue, so is the former'. Likewise, also, 'If what is not pleasant be not honourable, then what is honourable is pleasant'. Clearly, then, the conversion of the sequence 25 formed by contradiction of the terms of the thesis is a method convertible for both purposes.

Then look also at the case of the contraries of S and P in the thesis, and see if the contrary of the one follows upon the contrary of the other, either directly or conversely, both when you are demolishing and when you are establishing a view: secure arguments of this kind as well by means of induction, so far as may be required. Now the sequence is 30 direct in a case such as that of courage and cowardice: for upon the one of them virtue follows, and vice upon the other; and upon the one it follows that it is desirable, while upon the other it follows that it is objectionable. The sequence, therefore, in the latter case also is direct; for the desirable is the contrary of the objectionable. Likewise also in other

cases. The sequence is, on the other hand, converse in such
 35 a case as this: Health follows upon vigour, but disease
 does not follow upon debility; rather debility follows
 upon disease. In this case, then, clearly the sequence
 114^a is converse. Converse sequence is, however, rare in the
 case of contraries; usually the sequence is direct. If,
 therefore, the contrary of the one term does not follow
 upon the contrary of the other either directly or conversely,
 clearly neither does the one term follow upon the other in
 5 the statement made: whereas if the one followed the other
 in the case of the contraries, it must of necessity do so as well
 in the original statement.

You should look also into cases of the privation or presence
 of a state in like manner to the case of contraries. Only, in
 the case of such privations the converse sequence does not
 occur: the sequence is always bound to be direct: e.g. as
 10 sensation follows sight, while absence of sensation follows
 blindness. For the opposition of sensation to absence of
 sensation is an opposition of the presence to the privation
 of a state: for the one of them is a state, and the other the
 privation of it.

The case of relative terms should also be studied
 in like manner to that of a state and its privation: for
 15 the sequence of these as well is direct; e.g. if $3/1$ is a
 multiple, then $1/3$ is a fraction: for $3/1$ is relative to $1/3$,
 and so is a multiple to a fraction. Again, if knowledge be
 a conceiving, then also the object of knowledge is an object
 of conception; and if sight be a sensation, then also the
 20 object of sight is an object of sensation. An objection may
 be made that there is no necessity for the sequence to take
 place, in the case of relative terms, in the way described:
 for the object of sensation is an object of knowledge, whereas
 sensation is not knowledge. The objection is, however, not
 generally received as really true; for many people deny
 that there is knowledge of objects of sensation. More-
 over, the principle stated is just as useful for the contrary
 purpose, e.g. to show that the object of sensation is not an
 25 object of knowledge, on the ground that neither is sensation
 knowledge.

9 Again look at the case of the co-ordinates and inflected forms of the terms in the thesis, both in demolishing and in establishing it. By 'co-ordinates' are meant terms such as the following: 'Just deeds' and the 'just man' are co-ordinates of 'justice', and 'courageous deeds' and 'the courageous man' are co-ordinates of 'courage'. Likewise also things that tend to produce and to preserve anything are called co-ordinates of that which they tend to produce 30 and to preserve, as e.g. 'healthy habits' are co-ordinates of 'health' and a 'vigorous constitutional' of a 'vigorous constitution'—and so forth also in other cases. 'Co-ordinate', then, usually describes cases such as these, whereas 'inflected forms' are such as the following: 'justly', 'courageously', 'healthily', and such as are formed in this way. It is usually held that words when used in their inflected forms as well 35 are co-ordinates, as (e.g.) 'justly' in relation to justice, and 'courageously' to courage; and then 'co-ordinate' describes all the members of the same kindred series, e.g. 'justice', 'just', of a man or an act, 'justly'. Clearly, then, when any one member, whatever its kind, of the same kindred series is shown to be good or praiseworthy, then all the rest as well 114^b come to be shown to be so: ¹ e.g. if 'justice' be something praiseworthy, then so will 'just', of a man or thing, and 'justly' connote something praiseworthy. Then 'justly' will be rendered also 'praiseworthily', derived by the same inflexion from 'the praiseworthy' whereby 'justly' is derived 5 from 'justice'.

Look not only in the case of the subject mentioned, but also in the case of its contrary, for the contrary predicate: e.g. argue that good is not necessarily pleasant; for neither is evil painful: or that, if the latter be the case, so is the former. Also, if justice be knowledge, then injustice is ignorance: and if 'justly' means 'knowingly' and 'skillfully', 10 then 'unjustly' means 'ignorantly' and 'unskillfully': whereas if the latter be not true, neither is the former, as in the instance given just now: for 'unjustly' is more likely to seem equivalent to 'skillfully' than to 'unskillfully'. This commonplace rule has been stated before in dealing with

¹ 114^b 1. Read *δεδρυμένα γίγεται*, with the best MSS.

the sequence of contraries;¹ for all we are claiming now
 15 is that the contrary of P shall follow the contrary of S.

Moreover, look at the modes of generation and destruction
 of a thing, and at the things which tend to produce or to
 destroy it, both in demolishing and in establishing a view.
 For those things whose modes of generation rank among
 good things, are themselves also good; and if they them-
 selves be good, so also are their modes of generation. If,
 on the other hand, their modes of generation be evil, then
 they themselves also are evil. In regard to modes of destruc-
 20 tion the converse is true: for if the modes of destruction
 rank as good things, then they themselves rank as evil
 things; whereas if the modes of destruction count as evil,
 they themselves count as good. The same argument applies
 also to things tending to produce and destroy: for things
 whose productive causes are good, themselves also rank as
 good; whereas if causes destructive of them are good, they
 themselves rank as evil.

25 Again, look at things which are like the subject in question, 10
 and see if they are in like case; e g. if one branch of know-
 ledge has more than one object, so also will one opinion;
 and if to possess sight be to see, then also to possess hearing
 will be to hear. Likewise also in the case of other things,
 both those which are and those which are generally held to
 be like. The rule in question is useful for both purposes;
 30 for if it be as stated in the case of some one like thing, it is
 so with the other like things as well, whereas if it be not so
 in the case of some one of them, neither is it so in the case
 of the others. Look and see also whether the cases are alike
 as regards a single thing and a number of things: for
 sometimes there is a discrepancy. Thus, if to 'know' a thing
 be to 'think of' it, then also to 'know many things' is to
 'be thinking of many things'; whereas this is not true;
 for it is possible to know many things but not to be thinking
 35 of them. If, then, the latter proposition be not true, neither
 was the former that dealt with a single thing, viz. that to
 'know' a thing is to 'think of' it.

¹ 113^b 27-114^a 6.

Moreover, argue from greater and less degrees. In regard to greater degrees¹ there are four commonplace rules. One is: See whether a greater degree of the predicate follows a greater degree of the subject: e.g. if pleasure be good, see whether also a greater pleasure be a greater good: and if to do a wrong be evil, see whether also to do a greater wrong is a greater evil. Now this rule is of use for both purposes: for if an increase of the accident follows an increase of the subject, as we have said, clearly the accident belongs; while if it does not follow, the accident does not belong. You should establish this by induction. Another rule is: If one predicate be attributed to two subjects; then supposing it does not belong to the subject to which it is the more likely to belong, neither does it belong where it is less likely to belong; while if it does belong where it is less likely to belong, then it belongs as well where it is more likely. Again: If two predicates be attributed to one subject, then if the one which is more generally thought to belong does not belong, neither does the one that is less generally thought to belong; or, if the one that is less generally thought to belong does belong, so also does the other. Moreover: If two predicates be attributed to two subjects, then if the one which is more usually thought to belong to the one subject does not belong, neither does the remaining predicate belong to the remaining subject; or, if the one which is less usually thought to belong to the one subject does belong, so too does the remaining predicate to the remaining subject.

Moreover, you can argue from the fact that an attribute belongs, or is generally supposed to belong, in a like degree, in three ways, viz. those described in the last three rules given in regard to a greater degree.² For supposing that one predicate belongs, or is supposed to belong, to two subjects in a like degree, then if it does not belong to the one, neither does it belong to the other; while if it belongs to the one, it belongs to the remaining one as well. Or, supposing two predicates to belong in a like degree to the same subject, then, if the one does not belong, neither

¹ 114^b 37-8. Omit καὶ ἥττον before τόποι, with the best MSS.

² Il. 6-14.

does the remaining one; while if the one does belong, the remaining one belongs as well. The case is the same also if two predicates belong in a like degree to two subjects; for if the one predicate does not belong to the one subject, neither does the remaining predicate belong to the remaining subject, while if the one predicate does belong to the one subject, the remaining predicate belongs to the remaining subject as well.

25 You can argue, then, from greater or less or like degrees 11
of truth in the aforesaid number of ways. Moreover, you
should argue from the addition of one thing to another.
If the addition of one thing to another makes that other
good or white, whereas formerly it was not white or good,
then the thing added will be white or good—it will possess
the character it imparts to the whole as well. Moreover,
30 if an addition of something to a given object intensifies the
character which it had as given, then the thing added will
itself as well be of that character. Likewise, also, in the
case of other attributes. The rule is not applicable in all
cases, but only in those in which the excess described as an
'increased intensity' is found to take place. The above
rule is, however, not convertible for overthrowing a view.
For if the thing added does not make the other good, it is
35 not thereby made clear whether in itself it may not be good :
115^b for the addition of good to evil does not necessarily make
the whole good, any more than the addition of white to
black makes the whole white.

Again, any predicate of which we can speak of greater or
less degrees belongs also absolutely: for greater or less
degrees of good or of white will not be attributed to what
5 is not good or white: for a bad thing will never be said to
have a greater or less degree of goodness than another, but
always of badness. This rule is not convertible, either, for
the purpose of overthrowing a predication: for several predi-
cates of which we cannot speak of a greater degree belong
absolutely: for the term 'man' is not attributed in greater
10 and less degrees, but a man is a man for all that.

You should examine in the same way predicates attributed

in a given respect, and at a given time and place : for if the predicate be possible in some respect, it is possible also absolutely. Likewise, also, is what is predicated at a given time or place : for what is absolutely impossible is not possible either in any respect or at any place or time. An objection may be raised that in a given respect people may ¹⁵ be good by nature, e.g. they may be generous or temperately inclined, while absolutely they are not good by nature, because no one is prudent by nature. Likewise, also, it is possible for a destructible thing to escape destruction at a given time, whereas it is not possible for it to escape absolutely. In the same way also it is a good thing at certain places to follow such and such a diet, e.g. in infected ²⁰ areas, though it is not a good thing absolutely. Moreover, in certain places it is possible to live singly and alone, but absolutely it is not possible to exist singly and alone. In the same way also it is in certain places honourable to sacrifice one's father, e.g. among the Triballi, whereas, absolutely, it is not honourable. Or possibly this may indicate a relativity not to places but to persons : for it is all the same wherever they may be : for everywhere it will ²⁵ be held honourable among the Triballi themselves, just because they are Triballi. Again, at certain times it is a good thing to take medicines, e.g. when one is ill, but it is not so absolutely. Or possibly this again may indicate a relativity not to a certain time, but to a certain state of health : for it is all the same whenever it occurs, if only one be in that state. A thing is 'absolutely' so which without any addition you are prepared to say is honourable ³⁰ or the contrary. Thus (e.g.) you will deny that to sacrifice one's father is honourable : it is honourable only to certain persons : it is not therefore honourable absolutely. On the other hand, to honour the gods you will declare to be honourable without adding anything, because that is honourable absolutely. So that whatever without any addition is generally accounted to be honourable or dishonourable or anything else of that kind, will be said to be so 'absolutely'. ³⁵

BOOK III

THE question which is the more desirable, or the better,¹ of two or more things, should be examined upon the following lines: only first of all it must be clearly laid down that the inquiry we are making concerns not things
5 that are widely divergent and that exhibit great differences from one another (for nobody raises any doubt whether happiness or wealth is more desirable), but things that are nearly related and about which we commonly discuss for which of the two we ought rather to vote, because we do not see any advantage on either side as compared with the other.
10 Clearly, then, in such cases if we can show a single advantage, or more than one, our judgement will record our assent that whichever side happens to have the advantage is the more desirable.

First, then, that which is more lasting or secure is more desirable than that which is less so: and so is that which is more likely to be chosen by the prudent or by the good
15 man or by the right law, or by men who are good in any particular line, when they make their choice as such, or by the experts in regard to any particular class of things; i.e. either whatever most of them or what all of them would choose; e.g. in medicine or in carpentry those things are more desirable which most, or all, doctors would choose; or, in general, whatever most men or all men or all things would choose, e.g. the good: for everything aims at the
20 good. You should direct the argument you intend to employ to whatever purpose you require. Of what is 'better' or 'more desirable' the absolute standard is the verdict of the better science, though relatively to a given individual the standard may be his own particular science.

In the second place, that which is known as 'an x' is more desirable than that which does not come within the genus 'x'—e.g. justice than a just man; for the former

falls within the genus 'good', whereas the other does not, and the former is called 'a good', whereas the latter is not: 25 for nothing which does not happen to belong to the genus in question is called by the generic name; e.g. a 'white man' is not 'a colour'. Likewise also in other cases.

Also, that which is desired for itself is more desirable than that which is desired for something else; e.g. health is more desirable than gymnastics: for the former is desired 30 for itself, the latter for something else. Also, that which is desirable in itself is more desirable than what is desirable *per accidens*; e.g. justice in our friends than justice in our enemies: for the former is desirable in itself, the latter *per accidens*: for we desire that our enemies should be just *per accidens*, in order that they may do us no harm. This last principle is the same as the one that precedes it, with, 35 however, a different turn of expression. For we desire justice in our friends for itself, even though it will make no difference to us, and even though they be in India; whereas in our enemies we desire it for something else, in order that they may do us no harm.

Also, that which is in itself the cause of good is more 116^b desirable than what is so *per accidens*, e.g. virtue than luck (for the former is in itself, and the latter *per accidens*, the cause of good things),¹ and so in other cases of the same kind. Likewise also in the case of the contrary; for what is in itself the cause of evil is more objectionable than 5 what is so *per accidens*, e.g. vice and chance: for the one is bad in itself, whereas chance is so *per accidens*.

Also, what is good absolutely is more desirable than what is good for a particular person, e.g. recovery of health than a surgical operation; for the former is good absolutely, the latter only for a particular person, viz. the man who needs 10 an operation. So too what is good by nature is more desirable than the good that is not so by nature, e.g. justice than the just man; for the one is good by nature, whereas in the other case the goodness is acquired. Also the attribute is more desirable which belongs to the better and more

¹ 116^b 2-3. Treat ἡ μὲν γὰρ . . . τῶν ἀγαθῶν as a parenthesis, with Wallies.

honourable subject, e.g. to a god rather than to a man, and to the soul rather than to the body. So too the property of the better thing is better than the property of the worse ; e.g. 15 the property of God than the property of man : for whereas in respect of what is common in both of them they do not differ at all from each other, in respect of their properties the one surpasses the other. Also that is better which is inherent in things better or prior or more honourable : thus (e.g.) health is better than strength and beauty : for the former is inherent in the moist and the dry, and the hot and the cold, in fact in all the primary constituents of an animal, whereas the others are inherent in what is secondary, 20 strength being a feature of the sinews and bones, while beauty is generally supposed to consist in a certain symmetry of the limbs. Also the end is generally supposed to be more desirable than the means, and of two means, that which lies nearer the end. In general, too, a means directed towards the end of life is more desirable than a means to 25 anything else, e.g. that which contributes to happiness than that which contributes to prudence. Also the competent is more desirable than the incompetent. Moreover, of two productive agents that one is more desirable whose end is better ; while between a productive agent and an end we can decide by a proportional sum whenever the excess of the one end over the other is greater than that of the latter over its own productive means : e.g. supposing the excess of happiness over health to be greater than that of 30 health over what produces health, then what produces happiness is better than health. For what produces happiness exceeds what produces health just as much as happiness exceeds health. But health exceeds what produces health by a smaller amount ; *ergo*, the excess of what produces happiness over what produces health is greater than that of health over what produces health. Clearly, therefore, what 35 produces happiness is more desirable than health : for it exceeds the same standard by a greater amount.

Moreover, what is in itself nobler and more precious and praiseworthy is more desirable than what is less so, e.g. friendship than wealth, and justice than strength. For the

former belong in themselves to the class of things precious and praiseworthy, while the latter do so not in themselves ^{117^a} but for something else: for no one prizes wealth for itself but always for something else, whereas we prize friendship for itself, even though nothing else is likely to come to us from it.

- 2 Moreover, whenever two things are very much like one ⁵ another,¹ and we cannot see any superiority in the one over the other of them, we should look at them from the standpoint of their consequences. For the one which is followed by the greater good is the more desirable: or, if the consequences be evil, that is more desirable which is followed by the less evil. For though both may be desirable, yet there may possibly be some unpleasant consequence ¹⁰ involved to turn the scale. Our survey from the point of view of consequences lies in two directions, for there are prior consequences and later consequences: e. g. if a man learns, it follows that he was ignorant before and knows afterwards. As a rule, the later consequence is the better to consider. You should take, therefore, whichever of the consequences suits your purpose. ¹⁵

Moreover, a greater number of good things is more desirable than a smaller, either absolutely or when the one is included in the other, viz. the smaller number in the greater. An objection may be raised suppose in some particular case the one is valued for the sake of the other; for then the two together are not more desirable than the one; e. g. recovery of health and health, than health alone, inasmuch ²⁰ as we desire recovery of health for the sake of health. Also it is quite possible for what is not good, together with what is, to be more desirable than a greater number of good things,² e. g. the combination of happiness and something else which is not good may be more desirable than the

¹ 117^a 5. Read αὐτοῖς for ἀλλήλοις.

² 117^a 21. Read καὶ μὴ ἀγαθὰ μετ' ἀγαθῶν οὐδὲν καλὸν εἶναι οὐρεώτερον (sc. πλείονων ἰγαθῶν). Or, keeping the MS. reading, trans. 'Also it is quite possible for what are not good things to be more desirable than what are': happiness plus a not-good thing are not 'good things': only one of them is good.

combination of justice and courage. Also, the same things are more valuable if accompanied than if unaccompanied by pleasure, and likewise when free from pain than when
 25 attended with pain.

Also, everything is more desirable at the season when it is of greater consequence; e.g. freedom from pain in old age more than in youth: for it is of greater consequence in old age. On the same principle also,¹ prudence is more desirable in old age; for no man chooses the young to
 30 guide him, because he does not expect them to be prudent. With courage, the converse is the case, for it is in youth that the active exercise of courage is more imperatively required. Likewise also with temperance; for the young are more troubled by their passions than are their elders.

35 Also, that is more desirable which is more useful at every season or at most seasons, e.g. justice and temperance rather than courage: for they are always useful, while courage is only useful at times. Also, that one of two things which if all possess, we do not need the other thing, is more desirable than that which all may possess and still we want the other one as well. Take the case of justice and courage; if everybody were just, there would be no use
 117^b for courage, whereas all might be courageous, and still justice would be of use.

Moreover, judge by the destructions and losses and generations and acquisitions and contraries of things: for
 5 things whose destruction is more objectionable are themselves more desirable. Likewise also with the losses and contraries of things; for a thing whose loss or whose contrary is more objectionable is itself more desirable. With the generations or acquisitions of things the opposite is the case: for things whose acquisition or generation is more desirable are themselves also desirable.

10 Another commonplace rule is that what is nearer to the good is better and more desirable,² i.e. what more nearly resembles the good: thus justice is better than a just man. Also, that which is more like than another thing to some-

¹ 117^a 28. Read *κατὰ ταῦτα δέ*.

² 117^b 11. Read a comma only, not a full stop, after *αἰρετώτερον*.

thing better than itself, as e.g. some say that Ajax was a better man than Odysseus because he was more like Achilles. An objection may be raised to this that it is not true: for it is quite possible that Ajax did not resemble Achilles more nearly than Odysseus in the points which 15 made Achilles the best of them, and that Odysseus was a good man, though unlike Achilles. Look also to see whether the resemblance be that of a caricature, like the resemblance of a monkey to a man, whereas a horse bears none: for the monkey is not the more handsome creature, despite its nearer resemblance to a man. Again, in the case of two things, if one is more like the better thing 20 while another is more like the worse, then that is likely to be better which is more like the better. This too, however, admits of an objection: for quite possibly the one only slightly resembles the better, while the other strongly resembles the worse, e.g. supposing the resemblance of Ajax to Achilles to be slight, while that of Odysseus to Nestor is strong. Also it may be that the one which is 25 like the better type shows a degrading likeness, whereas the one which is like the worse type improves upon it: witness the likeness of a horse to a donkey, and that of a monkey to a man.

Another rule is that the more conspicuous good is more desirable than the less conspicuous, and the more difficult than the easier: for we appreciate better the possession of things that cannot be easily acquired. Also the more 30 personal possession is more desirable than the more widely shared. Also, that which is more free from connexion with evil: for what is not attended by any unpleasantness is more desirable than what is so attended.

Moreover, if A be without qualification better than B, then also the best of the members of A is better than the best of the members of B; e.g. if Man be better than Horse, then also the best man is better than the best horse. 35 Also, if the best in A be better than the best in B, then also A is better than B without qualification; e.g. if the best man be better than the best horse, then also Man is better than Horse without qualification.

Moreover, things which our friends can share are more desirable than those they cannot. Also, things which we like rather to do to our friend are more desirable than those we like to do to the man in the street, e.g. just dealing and the doing of good rather than the semblance of them :
 5 for we would rather really do good to our friends than seem to do so, whereas towards the man in the street the converse is the case.

Also, superfluities are better than necessities, and are sometimes more desirable as well : for the good life is better than mere life, and good life is a superfluity, whereas mere life itself is a necessity. Sometimes, though, what is better is not also more desirable : for there is no necessity
 10 that because it is better it should also be more desirable : at least to be a philosopher is better than to make money, but it is not more desirable for a man who lacks the necessities of life. The expression 'superfluity' applies whenever a man possesses the necessities of life and sets to work to secure as well other noble acquisitions. Roughly
 15 speaking, perhaps, necessities are more desirable, while superfluities are better.

Also, what cannot be got from another is more desirable than what can be got from another as well, as (e.g.) is the case of justice compared with courage. Also, A is more desirable if A is desirable without B, but not B without A : power (e.g.) is not desirable without prudence, but prudence
 20 is desirable without power. Also, if of two things we repudiate the one in order to be thought to possess the other, then that one is more desirable which we wish to be thought to possess ; thus (e.g.) we repudiate the love of hard work in order that people may think us geniuses.

Moreover, that is more desirable in whose absence it is
 25 less blameworthy for people to be vexed ; and that is more desirable in whose absence it is more blameworthy for a man not to be vexed.

Moreover, of things that belong to the same species one 3
 which possesses the peculiar virtue of the species is more desirable than one which does not. If both possess it, then

the one which possesses it in a greater degree is more desirable.

Moreover, if one thing makes good whatever it touches, while another does not, the former is more desirable, just ³⁰ as also what makes things warm is warmer than what does not. If both do so, then that one is more desirable which does so in a greater degree, or if it render good the better and more important object—if (e. g.), the one makes good the soul, and the other the body.

Moreover, judge things by their inflexions and uses and actions and works, and judge these by them: for they go ³⁵ with each other: e. g. if 'justly' means something more desirable than 'courageously', then also justice means something more desirable than courage; and if justice be more desirable than courage, then also 'justly' means something more desirable than 'courageously'. Similarly also in the other cases.

Moreover, if one thing exceeds while the other falls short ^{118^b} of the same standard of good, the one which exceeds is the more desirable; or if the one exceeds an even higher standard. Nay more, if there be two things both preferable to something, the one which is more highly preferable to it is more desirable than the less highly preferable. Moreover, when the excess of a thing is more desirable than ⁵ the excess of something else, that thing is itself also more desirable than the other, as (e. g.) friendship than money: for an excess of friendship is more desirable than an excess of money. So also that of which a man would rather that it were his by his own doing is more desirable than what he would rather get by another's doing, e. g. friends than money.

Moreover, judge by means of an addition, and see if the ¹⁰ addition of A to the same thing as B makes the whole more desirable than does the addition of B. You must, however, beware of adducing a case in which the common term uses, or in some other way helps the case of, one of the things added to it, but not the other, as (e. g.) if you took a saw and a sickle in combination with the art of carpentry: for in the combination the saw is a more desirable thing, ¹⁵ but it is not a more desirable thing without qualification.

Again, a thing is more desirable if, when added to a lesser good, it makes the whole a greater good. Likewise, also, you should judge by means of subtraction: for the thing upon whose subtraction the remainder is a lesser good may be taken to be a greater good, whichever it be whose¹ subtraction makes the remainder a lesser good.

- 20 Also, if one thing be desirable for itself, and the other for the look of it, the former is more desirable, as (e. g.) health than beauty. A thing is defined as being desired for the look of it if, supposing no one knew of it, you would not care to have it. Also, it is more desirable if it be desirable both for itself and for the look of it, while the other thing is desirable on the one ground alone. Also, whichever is the more precious for itself, is also better and more desirable.
- 25 A thing may be taken to be more precious in itself which we choose rather for itself, without anything else being likely to come of it.

Moreover, you should distinguish in how many senses 'desirable' is used, and with a view to what ends, e. g. expediency or honour or pleasure. For what is useful for all or most of them may be taken to be more desirable

30 than what is not useful in like manner. If the same characters belong to both things you should look and see which possesses them more markedly, i. e. which of the two is the more pleasant or more honourable or more expedient. Again, that is more desirable which serves the better purpose, e. g. that which serves to promote virtue more than that which serves to promote pleasure. Likewise also in the case of objectionable things; for that is more objectionable which stands more in the way of what is

35 desirable, e. g. disease more than ugliness: for disease is a greater hindrance both to pleasure and to being good.

Moreover, argue by showing that the thing in question is in like measure objectionable and desirable: for a thing of such a character that a man might well desire and object to it alike is less desirable than the other which is desirable only.

¹ 118^b 19. Read *ᾧ ποτε*.

- 4 Comparisons of things together should therefore be conducted in the manner prescribed. The same commonplace rules are useful also for showing that anything is simply desirable or objectionable: for we have only to subtract the excess of one thing over another. For if what is more precious be more desirable, then also what is precious is desirable; and if what is more useful be more desirable, then also what is useful is desirable. Likewise, also, in the case of other things which admit of comparisons of that kind. For in some cases in the very course of comparing the things together we at once assert also that each of them, or the one of them, is desirable, e.g. whenever we call the one good 'by nature' and the other 'not by nature': for clearly what is good by nature is desirable.

10

- 5 The commonplace rules relating to comparative degrees and amounts ought to be taken in the most general possible form: for when so taken they are likely to be useful in a larger number of instances. It is possible to render some of the actual rules given above more universal by a slight alteration of the expression, e.g. that what by nature exhibits such and such a quality exhibits that quality in a greater degree than what exhibits it not by nature. Also, if one thing does, and another does not, impart such and such a quality to that which possesses it, or to which it belongs, then whichever does impart it is of that quality in greater degree than the one which does not impart it; and if both impart it, then that one exhibits it in a greater degree which imparts it in a greater degree.

Moreover, if in any character one thing exceeds and another falls short of the same standard; also, if the one exceeds something which exceeds a given standard, while the other does not reach that standard,¹ then clearly the first-named thing exhibits that character in a greater degree. Moreover, you should judge by means of addition, and see if A when added to the same thing as B imparts to the whole such and such a character in a more marked

¹ 119^a 21. Read καὶ εἰ τὸ μὲν μᾶλλον τοιούτου μᾶλλον τοιοῦτο, τὸ δὲ μὴ τοιοῦτο.

degree than B, or if, when added to a thing which exhibits that character in a less degree, it imparts that character to
 25 the whole in a greater degree. Likewise, also, you may judge by means of subtraction: for a thing upon whose subtraction the remainder exhibits such and such a character in a less degree, itself exhibits that character in a greater degree. Also, things exhibit such and such a character in a greater degree if more free from admixture with their contraries; e.g. that is whiter which is more free from admixture with black. Moreover, apart from the rules given above, that has such and such a character in greater degree which admits in a greater degree of the definition
 30 proper to the given character; e.g. if the definition of 'white' be 'a colour which pierces the vision', then that is whiter which is in a greater degree a colour that pierces the vision.

If the question be put in a particular and not in a universal 6 form, in the first place the universal constructive or destructive commonplace rules that have been given may all be brought into use. For in demolishing or establishing a
 35 thing universally we also show it in particular: for if it be true of all, it is true also of some, and if untrue of all, it is untrue of some. Especially handy and of general application are the commonplace rules that are drawn from the opposites and co-ordinates and inflexions of a thing: for public opinion grants alike the claim that if all pleasure be good, then also all pain is evil, and the claim that if
 119^b some pleasure be good, then also some pain is evil. Moreover, if some form of sensation be not a capacity, then also some form of failure of sensation is not a failure of capacity. Also, if the object of conception is in some cases an object of knowledge, then also some form of conceiving is knowledge. Again, if what is unjust be in some cases good,
 5 then also what is just is in some cases evil; and if what happens justly is in some cases evil, then also what happens unjustly is in some cases good. Also, if what is pleasant is in some cases objectionable, then pleasure is in some cases an objectionable thing. On the same principle, also, if what is pleasant is in some cases beneficial, then pleasure

is in some cases a beneficial thing. The case is the same also as regards the things that destroy, and the processes of generation and destruction. For if anything that destroys pleasure or knowledge be in some cases good, then we may ¹⁰ take it that pleasure or knowledge is in some cases an evil thing. Likewise, also, if the destruction of knowledge be in some cases a good thing or its production an evil thing, then knowledge will be in some cases an evil thing ; e. g. if for a man to forget his disgraceful conduct be a good thing, and to remember it be an evil thing, then the knowledge of his disgraceful conduct may be taken to be an evil thing. ¹⁵ The same holds also in other cases : in all such cases the premiss and the conclusion are equally likely to be accepted.

Moreover you should judge by means of greater or smaller or like degrees: for if some member of another genus exhibit such and such a character in a more marked degree than your object, while no member of that genus exhibits that character at all, then you may take it that neither does the object in question exhibit it ; e. g. if some form of knowledge be good in a greater degree than pleasure, while no form of knowledge is good, then you may ²⁰ take it that pleasure is not good either. Also, you should judge by a smaller or like degree in the same way: for so you will find it possible both to demolish and to establish a view, except that whereas both are possible by means of like degrees, by means of a smaller degree it is possible only to establish, not to overthrow. For if a certain form of capacity be good in a like degree to knowledge, and a certain form of capacity be good, then so also is know- ²⁵ ledge ; while if no form of capacity be good, then neither is knowledge. If, too, a certain form of capacity be good in a less degree than knowledge, and a certain form of capacity be good, then so also is knowledge ; but if no form of capacity be good, there is no necessity that no form of knowledge either should be good. Clearly, then, it is only possible to establish a view by means of a less ³⁰ degree.

Not only by means of another genus can you overthrow

a view, but also by means of the same, if you take the most marked instance of the character in question ; e. g. if it be maintained that some form of knowledge is good, then, suppose it to be shown that prudence is not good, neither will any other kind be good, seeing that not even the kind upon which there is most general agreement is so. More-
 35 over, you should go to work by means of an hypothesis ; you should claim that the attribute, if it belongs or does not belong in one case, does so in a like degree in all, e. g. that if the soul of man be immortal, so are other souls as well, while if this one be not so, neither are the others. If, then, it be maintained that in some instance the attribute belongs, you must show that in some instance it does not belong : for then it will follow, by reason of the hypothesis, that it does not belong in any instance at all. If, on the
 120^a other hand, it be maintained that it does not belong in some instance, you must show that it does belong in some instance, for in this way it will follow that it belongs in all instances. It is clear that the maker of the hypothesis universalizes the question, whereas it was stated in a particular form : for he claims that the maker of a particular admission should make a universal admission, inasmuch as
 3 he claims that if the attribute belongs in one instance, it belongs also in all instances alike.

If the problem be indefinite, it is possible to overthrow a statement in only one way ; e. g. if a man has asserted that pleasure is good or is not good, without any further definition. For if he meant that a particular pleasure is good, you must show universally that no pleasure is good, if the
 10 proposition in question is to be demolished. And likewise, also, if he meant that some particular pleasure is not good you must show universally that all pleasure is good : it is impossible to demolish it in any other way. For if we show that some particular pleasure is not good or is good, the proposition in question is not yet demolished. It is clear, then, that it is possible to demolish an indefinite statement in
 15 one way only, whereas it can be established in two ways : for whether we show universally that all pleasure is good, or whether we show that a particular pleasure is good, the

proposition in question will have been proved. Likewise, also, supposing we are required to argue that some particular pleasure is not good, if we show that no pleasure is good or that a particular pleasure is not good, we shall have produced an argument in both ways, both universally and in particular, to show that some particular pleasure is not 20 good. If, on the other hand, the statement made be definite, it will be possible to demolish it in two ways; e.g. if it be maintained that it is an attribute of some particular pleasure to be good, while of some it is not: for whether it be shown that all pleasure, or that no pleasure, is good, the proposition in question will have been demolished. If, however, he has stated that only one single pleasure is good, it is possible to demolish it in three ways: for by showing that all pleasure, or that no pleasure, or that more 25 than one pleasure, is good, we shall have demolished the statement in question. If the statement be made still more definite, e.g. that prudence alone of the virtues is knowledge, there are four ways of demolishing it: for if it be shown that all virtue is knowledge, or that no virtue is so, or that some other virtue (e.g. justice) is so, or that prudence 30 itself is not knowledge, the proposition in question will have been demolished.

It is useful also to take a look at individual instances, in cases where some attribute has been said to belong or not to belong, as in the case of universal questions. Moreover, you should take a glance among genera, dividing them by 35 their species until you come to those that are not further divisible, as has been said before: ¹ for whether the attribute is found to belong in all cases or in none, you should, after adducing several instances, claim that he should either admit your point universally, or else bring an objection showing in what case it does not hold. Moreover, in cases where it is possible to make the accident definite either specifically or numerically, you should look and see whether perhaps none of them belongs, showing e.g. that time is not moved, nor yet is a movement, by enumerating how many 120^b species there are of movement: for if none of these belong

¹ 109^b 15.

to time, clearly it does not move, nor yet is a movement. Likewise, also, you can show that the soul is not a number,¹ by dividing all numbers into either odd or even : for then, if⁵ the soul be neither odd nor even, clearly it is not a number.

In regard then to Accident, you should set to work by means like these, and in this manner.

¹ Cf. Xenocrates, fr. 60 Heinze.

BOOK IV

120^b

1 NEXT we must go on to examine questions relating to 12
Genus and Property. These are elements in the questions
that relate to definitions, but dialecticians seldom address
their inquiries to these by themselves. If, then, a genus be 15
suggested for something that is, first take a look at all
objects which belong to the same genus as the thing men-
tioned, and see whether the genus suggested is *not* predi-
cated of one of them, as happens in the case of an accident:
e.g. if 'good' be laid down to be the genus of 'pleasure',
see whether some particular pleasure be not good: for, if so,
clearly 'good' is not the genus of pleasure: for the genus is
predicated of all the members of the same species. Secondly, 20
see whether it be predicated not in the category of essence,
but as an accident, as 'white' is predicated of 'snow', or
'self-moved' of the soul. For 'snow' is not a kind of
'white', and therefore 'white' is not the genus of snow, nor
is the soul a kind of 'moving object': its motion is an
accident of it, as it often is of an animal to walk or to be 25
walking. Moreover, 'moving' does not seem to indicate
the essence, but rather a state of doing or of having some-
thing done to it. Likewise, also, 'white': for it indicates
not the essence of snow, but a certain quality of it. So
that neither of them is predicated in the category of
'essence'.

Especially you should take a look at the definition of 30
Accident, and see whether it fits the genus mentioned,
as (e.g.) is also the case in the instances just given. For it
is possible for a thing to be and not to be self-moved, and
likewise, also, for it to be and not to be white. So that
neither of these attributes is the genus but an accident,
since we were saying¹ that an accident is an attribute
which can belong to a thing and also not belong. 35

¹ 102^b 6.

- Moreover, see whether the genus and the species be not found in the same division, but the one be a substance while the other is a quality, or the one be a relative while the other is a quality, as (e.g.) 'snow' and 'swan' are each a substance, while 'white' is not a substance but a quality, so that 'white' is not the genus either of 'snow' or of
- 121^a 'swan'. Again, 'knowledge' is a relative, while 'good' and 'noble' are each a quality, so that good, or noble, is not the genus of knowledge. For the genera of relatives ought themselves also to be relatives, as is the case with 'double':
- 5 for 'multiple', which is the genus of 'double', is itself also a relative. To speak generally, the genus ought to fall under the same division as the species: for if the species be a substance, so too should be the genus, and if the species be a quality, so too the genus should be a quality; e.g. if white be a quality, so too should colour be. Likewise, also, in other cases.
- 10 Again, see whether it be necessary or possible for the genus to partake of the object which has been placed in the genus. 'To partake' is defined as 'to admit the definition' of that which is partaken. Clearly, therefore, the species partake of the genera, but not the genera of the species: for the species admits the definition of the genus, whereas the genus does not admit that of the species. You
- 15 must look, therefore, and see whether the genus rendered partakes or can possibly partake of the species, e.g. if any one were to render anything as genus of 'being' or of 'unity': for then the result will be that the genus partakes of the species: for of everything that is, 'being' and 'unity' are predicated, and therefore their definition as well.
- 20 Moreover, see if there be anything of which the species rendered is true, while the genus is not so, e.g. supposing 'being' or 'object of knowledge' were stated to be the genus of 'object of opinion'. For 'object of opinion' will be a predicate of what does not exist; for many things which do not exist are objects of opinion; whereas that 'being' or 'object of knowledge' is not predicated of what does not exist is clear. So that neither 'being' nor 'object
- 25 of knowledge' is the genus of 'object of opinion': for of

the objects of which the species is predicated, the genus ought to be predicated as well.

Again, see whether the object placed in the genus be quite unable to partake of any of its species: for it is impossible that it should partake of the genus if it do not partake of any of its species, except it be one of the species reached by the first division: these do partake of the genus ³⁰ alone. If, therefore, 'Motion' be stated as the genus of pleasure, you should look and see if pleasure be neither locomotion nor alteration, nor any of the rest of the given modes of motion: for clearly you may then take it that it does not partake of any of the species, and therefore not of the genus either, since what partakes of the genus must necessarily partake of one of the species as well: so that ³⁵ pleasure could not be a species of Motion, nor yet be one of the individual phenomena comprised under the term 'motion'.¹ For individuals as well partake in the genus and the species, as (e.g.) an individual man partakes of both 'man' and 'animal'.

Moreover, see if the term placed in the genus has a wider ^{121^b} denotation than the genus, as (e.g.) 'object of opinion' has, as compared with 'being': for both what is and what is not are objects of opinion, so that 'object of opinion' could not be a species of being: for the genus is always of wider denotation than the species. Again, see if the species and its genus have an equal denotation; suppose, for instance, that ⁵ of the attributes which go with everything, one were to be stated as a species and the other as its genus, as for example Being and Unity: for everything has being and unity, so that neither is the genus of the other, since their denotation is equal. Likewise, also, if the 'first' of a series and the 'beginning' were to be placed one under the other:² for ¹⁰ the beginning is first and the first is the beginning, so that either both expressions are identical or at any rate neither is the genus of the other. The elementary principle in regard to all such cases is that the genus has a wider denotation than the species and its differentia: for the

¹ 121^a 36. Read οὐδέ τῶν ἀτόμων τῶν τῆς κινήσεως ὄντων.

² 121^b 9. Reading ὑπ' ἀλλήλα.

differentia as well has a narrower denotation than the genus.

- 15 See also whether the genus mentioned fails, or might be generally thought to fail, to apply to some object which is not specifically different from the thing in question; or, if your argument be constructive, whether it does so apply. For all things that are not specifically different have the same genus. If, therefore, it be shown to apply to one, then clearly it applies to all, and if it fails to apply to one, clearly it fails to apply to any; e.g. if any one who assumes 'indivisible lines' were to say that the 'indivisible' is their
20 genus. For the aforesaid term is not the genus of divisible lines, and these do not differ as regards their species from indivisible: for straight lines are never different from each other as regards their species.

- Look and see, also, if there be any other genus of the 2
25 given species which neither embraces the genus rendered nor yet falls under it, e.g. suppose any one were to lay down that 'knowledge' is the genus of justice. For virtue is its genus as well, and neither of these genera embraces the remaining one, so that knowledge could not be the genus of justice: for it is generally accepted that whenever one species falls under two genera, the one is embraced
30 by the other. Yet a principle of this kind gives rise to a difficulty in some cases. For some people hold that prudence is both virtue and knowledge, and that neither of its genera is embraced by the other: although certainly not everybody admits that prudence is knowledge. If, how-
35 ever, any one were to admit the truth of this assertion, yet it would still be generally agreed to be necessary that the genera of the same object must at any rate be subordinate either the one to the other or both to the same, as actually is the case with virtue and knowledge. For both fall under the same genus; for each of them is a state and a disposition. You should look, therefore, and see whether neither of these things is true of the genus rendered; for if the genera
122^a be subordinate neither the one to the other nor both to the same, then what is rendered could not be the true genus.

Look, also, at the genus of the genus rendered, and so continually at the next higher genus, and see whether all are predicated of the species, and predicated in the category of essence: for all the higher genera should be predicated of the species in the category of essence. If, then, there be anywhere a discrepancy, clearly what is rendered is not the true genus. [Again, see whether either the genus itself, or one of its higher genera, partakes of the species: for the higher genus does not partake of any of the lower.]¹ If, then, you are overthrowing a view, follow the rule as given: if establishing one, then—suppose that what has been named as genus be admitted to belong to the species, only it be disputed whether it belongs as genus—it is enough to show that one of its higher genera is predicated of the species in the category of essence. For if one of them be predicated in the category of essence, all of them, both higher and lower than this one, if predicated at all of the species, will be predicated of it in the category of essence: so that what has been *rendered* as genus is also predicated in the category of essence. The premiss that when one genus is predicated in the category of essence, all the rest, if predicated at all, will be predicated in the category of essence, should be secured by induction. Supposing, however, that it be disputed whether what has been rendered as genus belongs at all, it is not enough to show that one of the higher genera is predicated of the species in the category of essence: e.g. if any one has rendered 'locomotion' as the genus of walking, it is not enough to show that walking is 'motion' in order to show that it is 'locomotion', seeing that there are other forms of motion as well; but one must show in addition that walking does not partake of any of the species of motion produced by the same division except locomotion. For of necessity what partakes of the genus partakes also of one of the species produced by the first division of the genus. If, therefore, walking does not partake either of increase or decrease or of the other kinds of motion, clearly it would partake of locomotion, so that locomotion would be the genus of walking.

Again, look among the things of which the given species

¹ An irrelevant interruption here: it merely repeats 121^a 10 foll.

is predicated as genus, and see if what is rendered as its genus be also predicated in the category of essence of the very things of which the species is so predicated, and likewise if all the genera higher than this genus are so predicated as well. For if there be anywhere a discrepancy, 35 clearly what has been rendered is not the true genus: for had it been the genus, then both the genera higher than it, and it itself, would all have been predicated in the category of essence of those objects of which the species too is predicated in the category of essence. If, then, you are overthrowing a view, it is useful to see whether the genus fails to be predicated in the category of essence of those things of which the species too is predicated. If establishing a 122^b view, it is useful to see whether it is predicated in the category of essence: for if so, the result will be that the genus and the species will be predicated of the same object in the category of essence, so that the same object falls under two genera: the genera must therefore of necessity be subordinate one to the other, and therefore if it be shown 5 that the one we wish to establish as genus is not subordinate to the species, clearly the species would be subordinate to it, so that you may take it as shown that it is the genus.

Look, also, at the definitions of the genera, and see whether they apply both to the given species and to the objects which partake of the species. For of necessity the definitions of its genera must be predicated of the 10 species and of the objects which partake of the species: if, then, there be anywhere a discrepancy, clearly what has been rendered is not the genus.

Again, see if he has rendered the differentia as the genus, e.g. 'immortal' as the genus of 'God'. For 'immortal' is a differentia of 'living being', seeing that of living beings some are mortal and others immortal. Clearly, then, a bad 15 mistake has been made; for the differentia of a thing is never its genus. And that this is true is clear: for a thing's differentia never signifies its essence, but rather some quality, as do 'walking' and 'biped'.

Also, see whether he has placed the differentia inside the genus, e.g. by taking 'odd' as 'a number'. For 'odd' is

a differentia of number, not a species. Nor is the differentia 20 generally thought to partake of the genus: for what partakes of the genus is always either a species or an individual, whereas the differentia is neither a species nor an individual. Clearly, therefore, the differentia does not partake of the genus, so that 'odd' too is no species but a differentia, seeing that it does not partake of the genus.

Moreover, see whether he has placed the genus inside the 25 species, e.g. by taking 'contact' to be a 'juncture', or 'mixture' a 'fusion', or, as in Plato's definition,¹ 'locomotion' to be the same as 'carriage'. For there is no necessity that contact should be juncture: rather, conversely, juncture must be contact: for what is in contact is not always joined, though what is joined is always in contact. Likewise, also, in the remaining instances: for 30 mixture is not always a 'fusion' (for to mix dry things does not fuse them), nor is locomotion always 'carriage'. For walking is not generally thought to be carriage: for 'carriage' is mostly used of things that change one place for another involuntarily, as happens in the case of inanimate things. Clearly, also, the species, in the instances 35 given, has a wider denotation than the genus, whereas it ought to be vice versa.

Again, see whether he has placed the differentia inside the species, by taking (e.g.) 'immortal' to be 'a god'. For the result will be that the species has an equal or wider denotation: and this cannot be, for always the differentia has an equal or a wider denotation than the species. More- 123^a over, see whether he has placed the genus inside the differentia, by making 'colour' (e.g.) to be a thing that 'pierces', or 'number' a thing that is 'odd'. Also, see if he has mentioned the genus as differentia: for it is possible for a man to bring forward a statement of this kind as well, e.g. that 'mixture' is the differentia of 'fusion', or that 'change of place' is the differentia of 'carriage'. All such 5 cases should be examined by means of the same principles: for they depend upon common rules: for the genus should have a wider denotation than its differentia, and also should

¹ *Theaet.* 181 D.

not partake of its differentia ; whereas, if it be rendered in this manner, neither of the aforesaid requirements can be satisfied : for the genus will both have a narrower denotation than its differentia, and will partake of it.

Again, if no differentia belonging to the genus be predicated of the given species, neither will the genus be predicated of it ; e. g. of 'soul' neither 'odd' nor 'even' is predicated : neither therefore is 'number'. Moreover, see whether the species is naturally prior and abolishes the genus along with itself : for the contrary is the general view. Moreover, if it be possible for the genus stated, or for its differentia, to be absent from the alleged species, e. g. for 'movement' to be absent from the 'soul', or 'truth and falsehood' from 'opinion', then neither of the terms stated could be its genus or its differentia : for the general view is that the genus and the differentia accompany the species, as long as it exists.

Look and see, also, if what is placed in the genus partakes or could possibly partake of any contrary of the genus : for in that case the same thing will at the same time partake of contrary things, seeing that the genus is never absent from it, while it partakes, or can possibly partake, of the contrary genus as well. Moreover, see whether the species shares in any character which it is utterly impossible for any member of the genus to have. Thus (e. g.) if the soul has a share in life, while it is impossible for any number to live, then the soul could not be a species of number.

You should look and see, also, if the species be a homonym of the genus, and employ as your elementary principles those already stated for dealing with homonymity : ¹ for the genus and the species are synonymous.

Seeing that of every genus there is more than one species, look and see if it be impossible that there should be another species than the given one belonging to the genus stated : for if there should be none, then clearly what has been stated could not be a genus at all.

¹ 106^a 9 ff.

Look and see, also, if he has rendered as genus a metaphorical expression, describing (e. g.) 'temperance' as a 'harmony': for a genus is always predicated of its species ³⁵ in its literal sense, whereas 'harmony' is predicated of temperance not in a literal sense but metaphorically: for a harmony always consists in notes.

Moreover, if there be any contrary of the species, examine ^{123^b} it. The examination may take different forms; first of all see if the contrary as well be found in the same genus as the species, supposing the genus to have no contrary: for contraries ought to be found in the same genus, if there be no contrary to the genus. Supposing, on the other hand, ⁵ that there is a contrary to the genus, see if the contrary of the species be found in the contrary genus: for of necessity the contrary species must be in the contrary genus, if there be any contrary to the genus. Each of these points is made plain by means of induction. Again, see whether the contrary of the species be not found in any genus at all, but be itself a genus, e. g. 'good': for if this be not found in any genus, neither will its contrary be found in any ¹⁰ genus, but will itself be a genus, as happens in the case of 'good' and 'evil': for neither of these is found in a genus, but each of them is a genus. Moreover, see if both genus and species be contrary to something, and one pair of contraries have an intermediary, but not the other. For if the genera have an intermediary, so should their species as well, and if the species have, so should their genera as well, ¹⁵ as is the case with (1) virtue and vice and (2) justice and injustice: for each pair has an intermediary. An objection to this is that there is no intermediary between health and disease, although there is one between evil and good. Or see whether, though there be indeed an intermediary between both pairs, i. e. both between the species and between the genera, yet it be not similarly related, but in one case be a mere negation of the extremes, whereas in the other case ²⁰ it is a subject. For the general view is that the relation should be similar in both cases, as it is in the cases of virtue and vice and of justice and injustice: for the intermediaries between both are mere negations. Moreover, whenever the

- genus has no contrary, look and see not merely whether the contrary of the species be found in the same genus, but the
 25 intermediate as well : for the genus containing the extremes contains the intermediates as well, as (e. g.) in the case of white and black : for 'colour' is the genus both of these and of all the intermediate colours as well. An objection may be raised that 'defect' and 'excess' are found in the same genus (for both are in the genus 'evil'), whereas 'moderate amount', the intermediate between them, is found not in
 30 'evil' but in 'good'. Look and see also whether, while the genus has a contrary, the species has none ; for if the genus be contrary to anything, so too is the species, as virtue to vice and justice to injustice. Likewise, also, if one were to look at other instances, one would come to see clearly a fact like this. An objection may be raised in the case of health and disease :
 35 for health in general is the contrary of disease, whereas a particular disease, being a species of disease, e. g. fever and ophthalmia and any other particular disease, has no contrary.
- 124^a If, therefore, you are demolishing a view, there are all these ways in which you should make your examination : for if the aforesaid characters do not belong to it, clearly what has been rendered is not the genus. If, on the other hand, you are establishing a view, there are three ways : in the first place, see whether the contrary of the species be found in the genus stated, suppose the genus have no
 5 contrary : for if the contrary be found in it, clearly the species in question is found in it as well. Moreover, see if the intermediate species is found in the genus stated : for whatever genus contains the intermediate contains the extremes as well. Again, if the genus have a contrary, look and see whether also the contrary species is found in the contrary genus : for if so, clearly also the species in question is found in the genus in question.
- 10 Again, consider in the case of the inflexions and the co-ordinates of species and genus, and see whether they follow likewise, both in demolishing and in establishing a view. For whatever attribute belongs or does not belong to one belongs or does not belong at the same time to all ; e. g. if justice be a particular form of knowledge, then also

'justly' is 'knowingly' and the just man is a man of knowledge: whereas if any of these things be not so, then neither is any of the rest of them.

- 4 Again, consider the case of things that bear a like relation 15 to one another. Thus (e. g.) the relation of the pleasant to pleasure is like that of the useful to the good: for in each case the one produces the other. If therefore pleasure be a kind of 'good', then also the pleasant will be a kind of 'useful': for clearly it may be taken to be productive of good, seeing that pleasure is good. In the same way also 20 consider the case of processes of generation and destruction; if (e. g.) to build be to be active, then to have built is to have been active, and if to learn be to recollect, then also to have learnt is to have recollected, and if to be decomposed be to be destroyed, then to have been decomposed is to have been destroyed, and decomposition is a kind of destruction. Consider also in the same way the case of things that generate or destroy, and of the capacities 25 and uses of things; and in general, both in demolishing and in establishing an argument, you should examine things in the light of any resemblance of whatever description, as we were saying in the case of generation and destruction. For if what tends to destroy tends to decompose, then also to be destroyed is to be decomposed: and if what tends to generate tends to produce, then to be generated is to be 30 produced, and generation is production. Likewise, also, in the case of the capacities and uses of things: for if a capacity be a disposition, then also to be capable of something is to be disposed to it, and if the use of anything be an activity, then to use it is to be active, and to have used it is to have been active.

If the opposite of the species be a privation, there are 35 two ways of demolishing an argument, first of all by looking to see if the opposite be found in the genus rendered: for either the privation is to be found absolutely nowhere in the same genus, or at least not in the same ultimate genus: e. g. if the ultimate genus containing sight be sensation, then blindness will not be a sensation. Secondly, if there

124^b be a privation opposed to both genus and species, but the opposite of the species be not found in the opposite of the genus, then neither could the species rendered be in the genus rendered. If, then, you are demolishing a view, you should follow the rule as stated; but if establishing one there is but one way: for if the opposite species be found in the opposite genus, then also the species in question would be found in the genus in question: e.g. if 'blindness' be a form of 'insensibility', then 'sight' is a form of 'sensation'.

Again, look at the negations of the genus and species and convert the order of terms, according to the method described in the case of Accident:¹ e.g. if the pleasant be a kind of good, what is not good is not pleasant. For were this not so, something not good as well would then be pleasant. That, however, cannot be,² for it is impossible, if 'good' be the genus of pleasant, that anything not good should be pleasant: for of things of which the genus is not predicated, none of the species is predicated either. Also, in establishing a view, you should adopt the same method of examination: for if what is not good be not pleasant, then what is pleasant is good, so that 'good' is the genus of 'pleasant'.

15 If the species be a relative term, see whether the genus be a relative term as well: for 'if the species be a relative term, so too is the genus, as is the case with 'double' and 'multiple': for each is a relative term. If, on the other hand, the genus be a relative term, there is no necessity that the species should be so as well: for 'knowledge' is a relative term, but not so 'grammar'. Or possibly not even 20 the first statement would be generally considered true: for virtue is a kind of 'noble' and a kind of 'good' thing, and yet, while 'virtue' is a relative term, 'good' and 'noble' are not relatives but qualities. Again, see whether the species fails to be used in the same relation when called by its own name, and when called by the name of its genus: e.g. if the term 'double' be used to mean the 25 double of a 'half', then also the term 'multiple' ought to

¹ 113^b 15-26.² 124^b 10. Read ἀδύνατον γὰρ.

be used to mean multiple of a 'half'. Otherwise 'multiple' could not be the genus of 'double'.

Moreover, see whether the term fail to be used in the same relation both when called by the name of its genus, and also when called by those of all the genera of its genus. For if the double be a multiple of a half, then 'in excess of' ³⁰ will also be used in relation to a 'half': and, in general, the double will be called by the names of all the higher genera in relation to a 'half'. An objection may be raised that there is no necessity for a term to be used in the same relation when called by its own name and when called by that of its genus: for 'knowledge' is called knowledge 'of an object', whereas it is called a 'state' and 'disposition' not of an 'object' but of the 'soul'.

Again, see whether the genus and the species be used in ³⁵ the same way in respect of the inflexions they take, e.g. datives and genitives and all the rest. For as the species is used, so should the genus be as well, as in the case of 'double' and its higher genera: for we say both 'double of' and 'multiple of' a thing. Likewise, also, in the case of 'knowledge': for both 'knowledge' itself and its genera, ^{125^a} e.g. 'disposition' and 'state', are said to be 'of' something. An objection may be raised that in some cases it is not so: for we say 'superior *to*' and 'contrary *to*' so and so, whereas 'other', which is the genus of these terms, demands not 'to' but 'than': for the expression is 'other *than*' so and so.

Again, see whether terms used in like case-relationships ⁵ fail to yield a like construction when converted, as do 'double' and 'multiple'. For each of these terms takes a genitive both in itself and in its converted form: for we say both 'a half of' and 'a fraction of' something. The case is the same also as regards both 'knowledge' and 'conception': for these take a genitive, and by conversion ¹⁰ an 'object of knowledge' and an 'object of conception' are both alike¹ used with a dative. If, then, in any cases the constructions after conversion be not alike, clearly the one term is not the genus of the other.

¹ 125^a 11. Take away the colon after *ὁμοίως*.

Again, see whether the species and the genus fail to be used in relation to an equal number of things: for the
 15 general view is that the uses of both are alike and equal in number, as is the case with 'present' and 'grant'. For a 'present' is of something or to some one, and also a 'grant' is of something and to some one: and 'grant' is the genus of 'present', for a 'present' is a 'grant that need not be returned'. In some cases, however, the number of
 20 relations in which the terms are used happens not to be equal, for while 'double' is double *of* something, we speak of 'in excess' or 'greater' *in* something, as well as *of* or *than* something: for what is in excess or greater is always in excess *in* something, as well as in excess *of* something. Hence the terms in question are not the genera of 'double', inasmuch as they are not used in relation to an equal number of things with the species. Or possibly it is not universally true that species and genus are used in relation to an equal number of things.

25 See, also, if the opposite of the species have the opposite of the genus as its genus, e. g. whether, if 'multiple' be the genus of 'double', 'fraction' be also the genus of 'half'. For the opposite of the genus should always be the genus of the opposite species. If, then, any one were to assert that knowledge is a kind of sensation, then also the object of knowledge will have to be a kind of object of sensation, whereas it is not: for an object of knowledge is not always
 30 an object of sensation: for objects of knowledge include some of the objects of intuition as well. Hence 'object of sensation' is not the genus of 'object of knowledge': and if this be so, neither is 'sensation' the genus of 'knowledge'.

Seeing that of relative terms some are of necessity found in, or used of, the things in relation to which they happen at
 35 any time to be used (i. e. g. 'disposition' and 'state' and 'balance'; for in nothing else can the aforesaid terms possibly be found except in the things in relation to which they are used), while others need not be found in the things in relation to which they are used at any time, though they still may be (e. g. if the term 'object of knowledge' be

¹ 125^a 35. Beginning the bracket at *οἷον* . . . instead of at *ἐν* . . .

applied to the soul: for it is quite possible that the knowledge of itself should be possessed by the soul itself, but it is not necessary, for it is possible for this same knowledge 40 to be found in some one else), while for others, again, it is 125^b absolutely impossible that they should be found in the things in relation to which they happen at any time to be used (as e.g. that the contrary should be found in the contrary or knowledge in the object of knowledge, unless the object of knowledge happen to be a soul or a man)¹—you should look, therefore, and see whether he places a term of one 5 kind inside a genus that is not of that kind, e.g. suppose he has said that 'memory' is the 'abiding of knowledge'. For 'abiding' is always found in that which abides, and is used of that, so that the abiding of knowledge also will be found in knowledge. Memory, then, is found in knowledge, seeing that it is the abiding of knowledge. But this is impossible, for memory is always found in the soul. The aforesaid 10 commonplace rule is common to the subject of Accident as well: for it is all the same to say that 'abiding' is the genus of memory, or to allege that it is an accident of it. For if in any way whatever memory be the abiding of knowledge, the same argument in regard to it will apply.

- 5 Again, see if he has placed what is a 'state' inside the 15 genus 'activity', or an activity inside the genus 'state', e.g. by defining 'sensation' as 'movement communicated through the body': for sensation is a 'state', whereas movement is an 'activity'. Likewise, also, if he has said that memory is a 'state that is retentive of a conception', for memory is never a state, but rather an activity.

They also make a bad mistake who rank a 'state' within 20 the 'capacity' that attends it, e.g. by defining 'good temper' as the 'control of anger', and 'courage' and 'justice' as 'control of fears' and of 'gains': for the terms 'courageous' and 'good-tempered' are applied to a man who is immune from passion, whereas 'self-controlled' describes the man who is exposed to passion and not led by it. Quite possibly, indeed, each of the former is attended by a capacity such

¹ Bracketing 125^b 2-4 *ολον . . . ανθρωπος ειναι*.

25 that, if he were exposed to passion, he would control it and not be led by it: but, for all that, this is not what is meant by being 'courageous' in the one case, and 'good-tempered' in the other; what is meant is an absolute immunity from any passions of that kind at all.

Sometimes, also, people state any kind of attendant feature as the genus, e.g. 'pain' as the genus of 'anger' and 'conception' as that of 'conviction'. For both of the things in question follow in a certain sense upon the given species, but neither of them is genus to it. For when the angry man feels pain, the pain has appeared in him earlier than the anger: for his anger is not the cause of his pain, but his pain of his anger, so that anger emphatically *is* not pain. By the same reasoning,¹ 35 neither is conviction conception: for it is possible to have the same conception even without being convinced of it, whereas this is impossible if conviction be a species of conception: for it is impossible for a thing still to remain the same if it be entirely transferred out of its species, just as neither could the same animal at one time be, and at another not be, 40 a man. If, on the other hand, any one says that a man who has a conception must of necessity be also convinced of it, then 126^a 'conception' and 'conviction' will be used with an equal denotation, so that not even so could the former be the genus of the latter: for the denotation of the genus should be wider.

See, also, whether both naturally come to be anywhere in the same thing: for what contains the species contains the genus as well: e.g. what contains 'white' contains 'colour' 5 as well, and what contains 'knowledge of grammar' contains 'knowledge' as well. If, therefore, any one says that 'shame' is 'fear', or that 'anger' is 'pain', the result will be that genus and species are not found in the same thing: for shame is found in the 'reasoning' faculty, whereas fear is in the 'spirited' faculty, and 'pain' is found in the faculty 10 of 'desires' (for in this pleasure also is found), whereas 'anger' is found in the 'spirited' faculty. Hence the terms rendered are not the genera, seeing that they do not naturally come to be in the same faculty as the species. Likewise, also, if 'friendship' be found in the faculty of

¹ 135^b 35. Read *raîra*.

desires, you may take it that it is not a form of 'wishing': for wishing is always found in the 'reasoning' faculty. This commonplace rule is useful also in dealing with Accident: for the accident and that of which it is an accident are both ¹⁵ found in the same thing, so that if they do not appear in the same thing, clearly it is not an accident.

Again, see if the species partakes of the genus attributed only in some particular respect: for it is the general view that the genus is not thus imparted only in some particular respect: for a man is not an animal in a particular respect, nor is grammar knowledge in a particular respect only. Likewise also in other instances. Look, therefore, and see ²⁰ if in the case of any of its species the genus be imparted only in a certain respect; e.g. if 'animal' has been described as an 'object of perception' or of 'sight'. For an animal is an object of perception or of sight in a particular respect only; for it is in respect of its body that it is perceived and seen, not in respect of its soul, so that 'object of sight' and 'object of perception' could not be the genus of 'animal'. ²⁵

Sometimes also people place the whole inside the part without detection, defining (e.g.) 'animal' as an 'animate body'; whereas the part is not predicated in any sense of the whole, so that 'body' could not be the genus of animal, seeing that it is a part.

See also if he has put anything that is blameworthy or ³⁰ objectionable into the class 'capacity' or 'capable', e.g. by defining a 'sophist' or a 'slanderer', or a 'thief' as 'one who is capable of secretly thieving other people's property'.¹ For none of the aforesaid characters is so called because he is 'capable' in one of these respects: for even God and the good man are capable of doing bad things, but that is not ³⁵ their character: for it is always in respect of their choice that bad men are so called. Moreover, a capacity is always a desirable thing: for even the capacities for doing bad things are desirable, and therefore it is we say that even God and the good man possess them; for they are capable (we say) of doing evil. So then 'capacity' can never be the genus of anything blameworthy. Else, the result will be ^{126^b}

¹ 126^a 32. Read τὸν δυνάμενον λάθρᾳ ἀλλότρια κλέπτειν.

that what is blameworthy is sometimes desirable : for there will be a certain form of capacity that is blameworthy.

Also, see if he has put anything that is precious or desirable for its own sake into the class 'capacity' or 'capable' 5 or 'productive' of anything. For capacity, and what is capable or productive of anything, is always desirable for the sake of something else.

Or see if he has put anything that exists in two genera or more into one of them only. For some things it is impossible to place in a single genus, e.g. the 'cheat' and the 'slanderer': for neither he who has the will without the 10 capacity, nor he who has the capacity without the will, is a slanderer or cheat, but he who has both of them. Hence he must be put not into one genus, but into both the afore-said genera.

Moreover, people sometimes in converse order render genus as differentia, and differentia as genus, defining (e.g.) 15 astonishment as 'excess of wonderment' and conviction as 'vehemence of conception'. For neither 'excess' nor 'vehemence' is the genus, but the differentia: for astonishment is usually taken to be an 'excessive wonderment', and conviction to be a 'vehement conception', so that 'wonderment' and 'conception' are the genus, while 'excess' and 'vehemence' are the differentia. Moreover, if any one 20 renders 'excess' and 'vehemence' as genera,¹ then inanimate things will be convinced and astonished. For 'vehemence' and 'excess' of a thing are found in a thing which is thus vehement and in excess. If, therefore, astonishment be excess of wonderment the astonishment will be found in the wonderment, so that 'wonderment' will be astonished ! 25 Likewise, also, conviction will be found in the conception, if it be 'vehemence of conception', so that the conception will be convinced. Moreover, a man who renders an answer in this style will in consequence find himself calling vehemence vehement and excess excessive : for there is such a thing as a vehement conviction : if then conviction be 'vehemence', 30 there would be a 'vehement vehemence'. Likewise, also, there is such a thing as excessive astonishment : if then

¹ 126^b 20. Read γινῆ.

astonishment be an excess, there would be an 'excessive excess'. Whereas neither of these things is generally believed, any more than that knowledge is a knower¹ or motion a moving thing.

Sometimes, too, people make the bad mistake of putting an affection into that which is affected, as its genus, e.g. 35 those who say that immortality is everlasting life: for immortality seems to be a certain affection or accidental feature of life. That this saying is true would appear clear if any one were to admit that a man can pass from being mortal and become immortal: for no one will assert that he takes another life, but that a certain accidental feature or affection enters into this one as it is. So then 'life' is not 127^a the genus of immortality.

Again, see if to an affection he has ascribed as genus the object of which it is an affection, by defining (e.g.) wind as 'air in motion'. Rather, wind is 'a movement of air': for the same air persists both when it is in motion and when 5 it is still. Hence wind is not 'air' at all: for then there would also have been wind when the air was not in motion, seeing that the same air which formed the wind persists. Likewise, also, in other cases of the kind. Even, then, if we ought in this instance to admit the point that wind is 'air in motion', yet we should accept a definition of the 10 kind, not about all those things of which the genus is not true, but only in cases where the genus rendered is a true predicate. For in some cases, e.g. 'mud' or 'snow', it is not generally held to be true. For people tell you that snow is 'frozen water' and mud is 'earth mixed with moisture', whereas snow is not water, nor mud earth, so 15 that neither of the terms rendered could be the genus: for the genus should be true of all its species. Likewise neither is wine 'fermented water', as Empedocles speaks of 'water fermented in wood':² for it simply is not water at all.

- 6 Moreover, see whether the term rendered fail to be the 20 genus of anything at all; for then clearly it also fails to be

¹ 126^b 33. Read *ἐπιστήμη ἐπιστήμων*.

² Fr. 81.

the genus of the species mentioned. Examine the point by seeing whether the objects that partake of the genus fail to be specifically different from one another, e.g. white objects: for these do not differ specifically from one another, whereas of a genus the species are always different, so that
 25 'white' could not be the genus of anything.

Again, see whether he has named as genus or differentia some feature that goes with everything: for the number of attributes that follow everything is comparatively large: thus (e.g.) 'Being' and 'Unity' are among the number of attributes that follow everything. If, therefore, he has rendered 'Being' as a genus, clearly it would be the genus of everything, seeing that it is predicated of everything; for
 30 the genus is never predicated of anything except of its species. Hence Unity, *inter alia*, will be a species of Being. The result, therefore, is that of all things of which the genus is predicated, the species is predicated as well, seeing that Being and Unity are predicates of absolutely everything, whereas the predication of the species ought to be of narrower
 35 range. If, on the other hand, he has named as *differentia* some attribute that follows everything, clearly the denotation of the differentia will be equal to, or wider than, that of the genus. For if the genus, too, be some attribute that follows everything, the denotation of the differentia will be equal to its denotation, while if the genus do not follow everything, it will be still wider.

127^b Moreover, see if the description 'inherent in S' be used of the genus rendered in relation to its species, as it is used of 'white' in the case of snow, thus showing clearly that it could not be the genus: for 'true of S' is the only description used of the genus in relation to its species.

5 Look and see also if the genus fails to be synonymous with its species. For the genus is always predicated of its species synonymously.

Moreover, beware, whenever both species and genus have a contrary, and he places the better of the contraries inside the worse genus: for the result will be that the remaining
 10 species will be found in the remaining genus, seeing that contraries are found in contrary genera, so that the better

species will be found in the worse genus and the worse in the better: whereas the usual view is that of the better species the genus too is better. Also see if he has placed the species inside the worse and not inside the better genus, when it is at the same time related in like manner to both, as (e.g.) if he has defined the 'soul' as a 'form of motion' ¹⁵ or 'a form of moving thing'. For the same soul is usually thought to be a principle alike of rest and of motion, so that, if rest is the better of the two, this is the genus into which the soul should have been put.

Moreover, judge by means of greater and less degrees: if overthrowing a view, see whether the genus admits of a greater degree, whereas neither the species itself does so, nor any term that is called after it: e.g. if virtue admits of ²⁰ a greater degree, so too does justice and the just man: for one man is called 'more just than another'. If, therefore, the genus rendered admits of a greater degree, whereas neither the species does so itself nor yet any term called after it, then what has been rendered could not be the genus.

Again, if what is more generally, or as generally, thought to be the genus be not so, clearly neither is the genus rendered. The commonplace rule in question is useful especially in cases where the species appears to have several predicates in the category of essence, and where no distinction has been drawn between them, and we cannot say which of them is genus; e.g. both 'pain' and the 'concept- ³⁰ tion of a slight' are usually thought to be predicates of 'anger' in the category of essence: for the angry man is both in pain and also conceives that he is slighted. The same mode of inquiry may be applied also to the case of the species, by comparing it with some other species: for if the one which is more generally, or as generally, thought to be found in the genus rendered be not found therein, then ³⁵ clearly neither could the species rendered be found therein.

In demolishing a view, therefore, you should follow the rule as stated. In establishing one, on the other hand, the commonplace rule that you should see if both the genus rendered and the species admit of a greater degree will not ^{128^a}

serve : for even though both admit it, it is still possible for one not to be the genus of the other. For both 'beautiful' and 'white' admit of a greater degree, and neither is the genus of the other. On the other hand, the comparison of
 5 the genera and of the species one with another is of use: e.g. supposing A and B to have a like claim to be genus, then if one be a genus, so also is the other. Likewise also, if what has less claim be a genus, so also is what has more claim: e.g. if 'capacity' have more claim than 'virtue' to be the genus of self-control, and virtue be the genus, so also is capacity. The same observations will
 10 apply also in the case of the species. For instance, supposing A and B to have a like claim to be a species of the genus in question, then if the one be a species, so also is the other: and if that which is less generally thought to be so be a species, so also is that which is more generally thought to be so.

Moreover, to establish a view, you should look and see if the genus is predicated in the category of essence of those things of which it has been rendered as the genus, suppos-
 15 ing the species rendered to be not one single species but several different ones: for then clearly it will be the genus. If, on the other, the species rendered be single, look and see whether the genus be predicated in the category of essence of other species as well: for then, again, the result will be that it is predicated of several different species.

20 Since some people think that the differentia, too, is a predicate of the various species in the category of essence, you should distinguish the genus from the differentia by employing the aforesaid elementary principles—(a) that the genus has a wider denotation than the differentia; (b) that in rendering the essence of a thing it is more fitting to state the genus than the differentia: for any one
 25 who says that 'man' is an 'animal' shows what man is better than he who describes him as 'walking'; also (c) that the differentia always signifies a quality of the genus, whereas the genus does not do this of the differentia: for he who says 'walking' describes an animal of a certain quality, whereas he who says 'animal' does not describe a walking thing of a certain quality.

The differentia, then, should be distinguished from the 30
genus in this manner. Now seeing it is generally held that
if¹ what is musical, in being musical, possesses knowledge
in some respect, then also 'music' is a particular kind of
'knowledge'; and also that if what walks is moved in
walking, then 'walking' is a particular kind of 'movement';
you should therefore examine in the aforesaid manner any
genus in which you want to establish the existence of some-
thing: e. g., if you wish to prove that 'knowledge' is a form 35
of 'conviction', see whether the knower in knowing is con-
vinced: for then clearly knowledge would be a particular
kind of conviction. You should proceed in the same way
also in regard to the other cases of this kind.

Moreover, seeing that it is difficult to distinguish what-
ever always follows along with a thing, and is not con-
vertible with it, from its genus, if A follows B universally,
whereas B does not follow A universally—as e. g. 'rest' 128^b
always follows a 'calm' and 'divisibility' follows 'number',
but not conversely (for the divisible is not always a number,
nor rest a calm)—you may yourself assume in your treat-
ment of them that the one which always follows is the
genus, whenever the other is not convertible with it: if, on 5
the other hand, some one else puts forward the proposition,
do not accept it universally. An objection to it is that 'not-
being' always follows what is 'coming to be' (for what is
coming to be is not) and is not convertible with it (for
what is not is not always coming to be), and that still
'not-being' is not the genus of 'coming to be': for 'not-
being' has not any species at all.

Questions, then, in regard to Genus should be investi- 10
gated in the ways described.

¹ 128^a 31, adopting Imelman's restoration (at which I had arrived independently) ἐπεὶ δὲ δοκεῖ <εἶ> τὸ μουσικὸν . . . ἐπιστημὸν τί ἐστι, καὶ ἡ μουσικὴ . . .

BOOK V

128^b

14 THE question whether the attribute stated is or is not
a property, should be examined by the following methods:

Any 'property' rendered is always either essential and permanent or relative and temporary: e.g. it is an 'essential property' of man to be 'by nature a civilized animal': a 'relative property' is one like that of the soul in relation to the body, viz. that the one is fitted to command, and the other to obey: a 'permanent property' is one like the
20 property which belongs to God, of being an 'immortal living being': a 'temporary property' is one like the property which belongs to any particular man of walking in the gymnasium.

¹[The rendering of a property 'relatively' gives rise either to two problems or to four. For if he at the same time render this property of one thing and deny it of another, only two problems arise, as in the case of a state-
25 ment that it is a property of a man, in relation to a horse, to be a biped. For one might try both to show that a man is not a biped, and also that a horse is a biped: in both ways the property would be upset.² If on the other hand he render one apiece of two attributes to each of two things, and deny it in each case of the other, there will then be four problems; as in the case of a statement that it is a property
30 of a man in relation to a horse for the former to be a biped and the latter a quadruped. For then it is possible to try to show both that a man is not naturally a biped, and that he is a quadruped, and also that the horse both is a biped, and is not a quadruped. If you show any of these at all, the intended attribute is demolished.]

An 'essential' property is one which is rendered of a thing
35 in comparison with everything else and distinguishes the

¹ 128^b 22-33. The natural place of this paragraph is after 129^a 16.

² 128^b 27. Read *κινούμενο τὸ ἴδιον*.

said thing from everything else, as does 'a mortal living being capable of receiving knowledge' in the case of man. A 'relative' property is one which separates its subject off not from everything else but only from a particular definite thing, as does the property which virtue possesses, in comparison with knowledge, viz. that the former is naturally produced in more than one faculty, whereas the latter is produced in that of reason alone, and in those who have a reasoning faculty. A 'permanent' property is one which is true at every time, and never fails, like being 'compounded of soul and body', in the case of a living creature. A 'temporary' property is one which is true at some particular time, and does not of necessity always follow; as, of some particular man, that he walks in the market-place. 5

To render a property 'relatively' to something else means to state the difference between them as it is found either universally and always, or generally and in most cases: thus a difference that is found universally and always, is one such as man possesses in comparison with a horse, viz. being a biped: for a man is always and in every case a biped, whereas a horse is never a biped at any time. On the other hand, a difference that is found generally and in most cases, is one such as the faculty of reason possesses in comparison with that of desire and spirit, in that the former commands, while the latter obeys for the reasoning faculty does not always command, but sometimes also is under command, nor is that of desire and spirit always under command, but also on occasion assumes the command, 15 whenever the soul of a man is vicious.

Of 'properties' the most 'arguable' are the essential and permanent and the relative. For a relative property gives rise, as we said before,¹ to several questions: for of necessity 20 the questions arising are either two or four, so that arguments in regard to these are several. An essential and a permanent property you can discuss in relation to many things, or can observe in relation to many periods of time: if 'essential', discuss it in comparison with many things: for the property ought to belong to its subject in compari- 25

¹ 128^b 22.

son with every single thing that is, so that if the subject be not distinguished by it in comparison with everything else, the property could not have been rendered correctly. So a permanent property you should observe in relation to many periods of time; for if it does not or did not, or is not going to, belong, it will not be a property. On the other hand, about a temporary property we do not inquire further than in regard to the time called 'the present'; and
 30 so arguments in regard to it are not many; whereas an 'arguable' question is one in regard to which it is possible for arguments both numerous and good to arise.

The so-called 'relative' property, then, should be examined by means of the commonplace arguments relating to Accident, to see whether it belongs to the one thing and not to the other: on the other hand, permanent and essential
 35 properties should be considered by the following methods.

129^b First, see whether the property has or has not been 2 rendered correctly. Of a rendering being incorrect or correct, one test is to see whether the terms in which the property is stated are not or are more intelligible—for destructive purposes, whether they are not so, and for con-
 5 structive purposes, whether they are so. Of the terms not being more intelligible, one test is to see whether the property which he renders is altogether more unintelligible than the subject whose property he has stated: for, if so, the property will not have been stated correctly. For the object of getting a property constituted is to be intelligible: the terms therefore in which it is rendered should be more intelligible: for in that case it will be possible to conceive
 10 it more adequately, e.g. any one who has stated that it is a property of 'fire' to 'bear a very close resemblance to the soul', uses the term 'soul', which is less intelligible than 'fire'—for we know better what fire is than what soul is—, and therefore a 'very close resemblance to the soul' could not be correctly stated to be a property of fire. Another test is to see whether the attribution of A (property) to B (subject) fails to be more intelligible. For not only should the property be more intelligible than its subject,

but also it should be something whose attribution to the particular subject is a more intelligible attribution. For he who does not know whether it is an attribute of the particular subject at all, will not know either whether it belongs to it alone, so that whichever of these results happens, its character as a property becomes obscure. Thus (e.g.) a man who has stated that it is a property of fire to be 'the primary element wherein the soul is naturally found', has introduced a subject which is less intelligible than 'fire', viz. whether the soul is found in it, and whether it is found there primarily; and therefore to be 'the primary element in which the soul is naturally found' could not be correctly stated to be a property of 'fire'. On the other hand, for constructive purposes, see whether the terms in which the property is stated are more intelligible, and if they are more intelligible in each of the aforesaid ways. For then the property will have been correctly stated in this respect: for of constructive arguments, showing the correctness of a rendering, some will show the correctness merely in this respect, while others will show it without qualification. Thus (e.g.) a man who has said that the 'possession of sensation' is a property of 'animal' has both used more intelligible terms and has rendered the property more intelligible in each of the aforesaid senses; so that to 'possess sensation' would in this respect have been correctly rendered as a property of 'animal'.

Next, for destructive purposes, see whether any of the terms rendered in the property is used in more than one sense, or whether the whole expression too signifies more than one thing. For then the property will not have been correctly stated. Thus (e.g.) seeing that to 'be sentient' signifies more than one thing, viz. (1) to possess sensation, (2) to use one's sensation, 'being naturally sentient' could not be a correct statement of a property of 'animal'. The reason why the term you use, or the whole expression signifying the property, should not bear more than one meaning is this, that an expression bearing more than one meaning makes the object described obscure, because the man who is about to attempt an argument is in doubt which

of the various senses the expression bears: and this will not do, for the object of rendering the property is that he may understand. Moreover, in addition to this, it is inevitable that those who render a property after this fashion should be somehow refuted whenever any one addresses his syllogism to that one of the term's several meanings which does not agree. For constructive purposes, on the other hand, see whether both all the terms and also the expression as a whole avoid bearing more than one sense: for then the property will have been correctly stated in this respect. Thus (e.g.) seeing that 'body' does not bear several meanings, nor 'quickest to move upwards in space', nor yet the whole expression made by putting them together, it would be correct in this respect to say that it is a property of fire to be the 'body quickest to move upwards in space'.

Next, for destructive purposes, see if the term of which he renders the property is used in more than one sense, and no distinction has been drawn as to which of them it is whose property he is stating: for then the property will not have been correctly rendered. The reasons why this is so are quite clear from what has been said above:¹ for the same results are bound to follow. Thus (e.g.) seeing that 'the knowledge of this' signifies many things—for it means (1) the possession of knowledge by it, (2) the use of its knowledge by it, (3) the existence of knowledge about it, (4) the use of knowledge about it—no property of the 'knowledge of this' could be rendered correctly unless he draw a distinction as to which of these it is whose property he is rendering. For constructive purposes, a man should see if the term of which he is rendering the property avoids bearing many senses and is one and simple: for then the property will have been correctly stated in this respect. Thus (e.g.) seeing that 'man' is used in a single sense, 'naturally civilized animal' would be correctly stated as a property of man.

Next, for destructive purposes, see whether the same term has been repeated in the property. For people often do this undetected in rendering 'properties' also, just as they

¹ 129^b 7.

do in their 'definitions' as well: but a property to which this has happened will not have been correctly stated: for the repetition of it confuses the hearer; thus inevitably the meaning becomes obscure, and further, such people are thought to babble. Repetition of the same term is likely to happen in two ways: one is, when a man repeatedly uses 35 the same word, as would happen if any one were to render, as a property of fire, 'the body which is the most rarefied of bodies' (for he has repeated the word 'body'); the second is, if a man replaces words by their definitions, as would happen if any one were to render, as a property of earth, 130^b 'the substance which is by its nature most easily of all bodies borne downwards in space', and were then to substitute 'substances of such and such a kind' for the word 'bodies': for 'body' and 'a substance of such and such a kind' mean one and the same thing. For he will have repeated the word 'substance', and accordingly neither of the properties would be correctly stated. For constructive 5 purposes, on the other hand, see whether he avoids ever repeating the same term; for then the property will in this respect have been correctly rendered. Thus (e.g.) seeing that he who has stated 'animal capable of acquiring knowledge' as a property of man has avoided repeating the same term several times, the property would in this respect have 10 been correctly rendered of man.

Next, for destructive purposes, see whether he has rendered in the property any such term as is a universal attribute. For one which does not distinguish its subject from other things is useless, and it is the business of the language of 'properties', as also of the language of definitions, to distinguish. In the case contemplated, therefore, 15 the property will not have been correctly rendered. Thus (e.g.) a man who has stated that it is a property of knowledge to be a 'conception incontrovertible by argument, because of its unity', has used in the property a term of that kind, viz. 'unity', which is a universal attribute; and therefore the property of knowledge could not have been correctly stated. For constructive purposes, on the other hand, see whether he has avoided all terms that are

common to everything and used a term that distinguishes the subject from something: for then the property will in
 20 this respect have been correctly stated. Thus (e.g.) inasmuch as he who has said that it is a property of a 'living creature' to 'have a soul' has used no term that is common to everything, it would in this respect have been correctly stated to be a property of a 'living creature' to 'have a soul'.

Next, for destructive purposes see whether he renders more than one property of the same thing, without a definite proviso that he is stating more than one: for then the
 25 property will not have been correctly stated. For just as in the case of definitions too there should be no further addition beside the expression which shows the essence, so too in the case of properties nothing further should be rendered beside the expression that constitutes the property mentioned: for such an addition is made to no purpose. Thus (e.g.) a man who has said that it is a property of fire
 30 to be 'the most rarefied and lightest body' has rendered more than one property (for each term is a true predicate of fire alone); and so it could not be a correctly stated property of fire to be 'the most rarefied and lightest body'. On the other hand, for constructive purposes, see whether he has avoided rendering more than one property of the same thing, and has rendered one only: for then the property will in this respect have been correctly stated.
 35 Thus (e.g.) a man who has said that it is a property of a liquid to be a 'body adaptable to every shape' has rendered as its property a single character and not several, and so the property of 'liquid' would in this respect have been correctly stated.

Next, for destructive purposes, see whether he has em- 3
 ployed either the actual subject whose property he is rendering, or any of its species: for then the property will
 131^a not have been correctly stated. For the object of rendering the property is that people may understand: now the subject itself is just as unintelligible as it was to start with, while any one of its species is posterior to it, and so is no more intelligible. Accordingly it is impossible to under-

stand anything further by the use of these terms. Thus (e. g.) any one who has said that it is a property of 'animal' to be 'the substance to which "man" belongs as a species' has employed one of its species, and therefore the property ⁵ could not have been correctly stated. For constructive purposes, on the other hand, see whether he avoids introducing either the subject itself or any of its species: for then the property will in this respect have been correctly stated. Thus (e. g.) a man who has stated that it is a property of a living creature to be 'compounded of soul and body' has avoided introducing among the rest either the subject itself or any of its species, and therefore in ¹⁰ this respect the property of a 'living creature' would have been correctly rendered.

You should inquire in the same way also in the case of other terms that do or do not make the subject more intelligible: thus, for destructive purposes, see whether he has employed anything either opposite to the subject or, in general, anything simultaneous by nature with it or pos- ¹⁵ terior to it: for then the property will not have been correctly stated. For an opposite is simultaneous by nature with its opposite, and what is simultaneous by nature or is posterior to it does not make its subject more intelligible. Thus (e. g.) any one who has said that it is a property of good to be 'the most direct opposite of evil', has employed the opposite of good, and so the property of good could not have been correctly rendered. ²⁰ For constructive purposes, on the other hand, see whether he has avoided employing anything either opposite to, or, in general, simultaneous by nature with the subject, or posterior to it: for then the property will in this respect have been correctly rendered. Thus (e. g.) a man who has stated that it is a property of knowledge to be 'the most convincing conception' has avoided employing anything either opposite to, or simultaneous by nature with, or posterior to, the subject; and so the property of knowledge ²⁵ would in this respect have been correctly stated.

Next, for destructive purposes, see whether he has rendered as property something that does not always follow

- the subject but sometimes ceases to be its property: for then the property will not have been correctly described. For
 30 there is no necessity either that the name of the subject must also be true of anything to which we find such an attribute belonging; nor yet that the name of the subject will be untrue of anything to which such an attribute is found not to belong. Moreover, in addition to this, even after he has rendered the property it will not be clear whether it belongs, seeing that it is the kind of attribute that may fail: and
 35 so the property will not be clear. Thus (e.g.) a man who has stated that it is a property of animal 'sometimes to move and sometimes to stand still' has rendered the kind of property which sometimes is not a property, and so the property could not have been correctly stated. For constructive purposes, on the other hand, see whether he has rendered something that of necessity must always be a
 181^b property: for then the property will have been in this respect correctly stated. Thus (e.g.) a man who has stated that it is a property of virtue to be 'what makes its possessor good' has rendered as property something that always follows, and so the property of virtue would in this respect have been correctly rendered.
- 5 Next, for destructive purposes, see whether in rendering the property of the present time he has omitted to make a definite proviso that it is the property of the present time which he is rendering: for else the property will not have been correctly stated. For in the first place, any unusual procedure always needs a definite proviso: and it is the usual procedure for everybody to render as property some
 10 attribute that always follows. In the second place, a man who omits to provide definitely whether it was the property of the present time which he intended to state, is obscure: and one should not give any occasion for adverse criticism. Thus (e.g.) a man who has stated it as the property of a particular man 'to be sitting with a particular man', states the property of the present time, and so he cannot have rendered the property correctly, seeing that he has described it without any definite proviso. For constructive purposes, on the other hand, see whether, in rendering the

property of the present time, he has, in stating it, made ¹⁵ a definite proviso that it is the property of the present time that he is stating: for then the property will in this respect have been correctly stated. Thus (e.g.) a man who has said that it is the property of a particular man 'to be walking now', has made this distinction in his statement, and so the property would have been correctly stated.

Next, for destructive purposes, see whether he has rendered a property of the kind whose appropriateness is not ²⁰ obvious except by sensation: for then the property will not have been correctly stated. For every sensible attribute, once it is taken beyond the sphere of sensation, becomes uncertain. For it is not clear whether it still belongs, because it is evidenced only by sensation. This principle will be true in the case of any attributes that do not always ²⁵ and necessarily follow. Thus (e.g.) any one who has stated that it is a property of the sun to be 'the brightest star that moves over the earth', has used in describing the property an expression of that kind, viz. 'to move over the earth', which is evidenced by sensation; and so the sun's property could not have been correctly rendered: for it will be uncertain, whenever the sun sets, whether it continues to move over the earth, because sensation then fails us. For ³⁰ constructive purposes, on the other hand, see whether he has rendered the property of a kind that is not obvious to sensation, or, if it be sensible, must clearly belong of necessity: for then the property will in this respect have been correctly stated. Thus (e.g.) a man who has stated that it is a property of a surface to be 'the primary thing that is coloured', has introduced amongst the rest a sensible quality, 'to be coloured', but still a quality such as mani- ³⁵ festly always belongs, and so the property of 'surface' would in this respect have been correctly rendered.

Next, for destructive purposes, see whether he has rendered the definition as a property: for then the property will not have been correctly stated: for the property of a thing ought not to show its essence. Thus (e.g.) a man ¹³² who has said that it is the property of man to be 'a walking, biped animal' has rendered a property of man so as to

signify his essence, and so the property of man could not have been correctly rendered. For constructive purposes, on the other hand, see whether the property which he has rendered forms a predicate convertible with its subject, without, however, signifying its essence: for then the property will in this respect have been correctly rendered. Thus (e. g.) he who has stated that it is a property of man to be a 'naturally civilized animal' has rendered the property so as to be convertible with its subject, without, however, showing its essence, and so the property of 'man' would in this respect have been correctly rendered.

10 Next, for destructive purposes, see whether he has rendered the property without having placed ¹ the subject within its essence. For of properties, as also of definitions, the first term to be rendered should be the genus, and then the rest of it should be appended immediately afterwards, and should distinguish its subject from other things. Hence a property which is not stated in this way could not
15 have been correctly rendered. Thus (e. g.) a man who has said that it is a property of a living creature to 'have a soul' has not placed 'living creature' within its essence, and so the property of a living creature could not have been correctly stated. For constructive purposes, on the other hand, see whether a man first places within its essence the subject whose property he is rendering, and then appends the rest: for then the property will in this respect have been correctly rendered. Thus (e. g.) he who has
20 stated that it is a property of man to be an 'animal capable of receiving knowledge', has rendered the property after placing the subject within its essence, and so the property of 'man' would in this respect have been correctly rendered.

The inquiry, then, whether the property has been cor-
rectly rendered or no, should be made by these means. The question, on the other hand, whether what is stated is
25 or is not a property at all, you should examine from the following points of view. For the commonplace arguments which establish absolutely that the property is accurately

¹ 132^a 10. Omitting *δ* before *θεῖς*.

stated will be the same as those that constitute it a property at all: accordingly they will be described in the course of them.

Firstly, then, for destructive purposes, take a look at each subject of which he has rendered the property, and see (e.g.) if it fails to belong to any of them at all, or to be true of them in that particular respect, or to be a property of each of them in respect of that character of which he ³⁰ has rendered the property: for then what is stated to be a property will not be a property. Thus, for example, inasmuch as it is not true of the geometrician that he 'cannot be deceived by an argument' (for a geometrician is deceived when his figure is misdrawn), it could not be a property of the man of science that he is not deceived by an argument. For constructive purposes, on the other hand, see whether ³⁵ the property rendered be true of every instance, and true in that particular respect: for then what is stated not to be a property¹ will be a property. Thus, for example, inasmuch as the description 'an animal capable of receiving ^{132^b} knowledge' is true of every man, and true of him *qua* man, it would be a property of man to be 'an animal capable of receiving knowledge'. [This commonplace rule means— for destructive purposes, see if the description fails to be ⁵ true of that of which the name is true; and if the name fails to be true of that of which the description is true: for constructive purposes, on the other hand, see if the description too is predicated of that of which the name is predicated, and if the name too is predicated of that of which the description is predicated.]²

Next, for destructive purposes, see if the description fails to apply to that to which the name applies, and if the name fails to apply to that to which the description applies: for ¹⁰ then what is stated to be a property will not be a property. Thus (e.g.) inasmuch as the description 'a living being that partakes of knowledge' is true of God, while 'man' is not predicated of God, to be 'a living being that partakes of

¹ 132^a 36. Read τὸ κείμενον μὴ εἶναι ἴδιον, with A, B, Pacius, Waitz, and Strache—as in the subsequent examples.

² I think, with Pacius (though for a different reason), that this sentence (132^b 3-8) is probably an addition by a later hand.

knowledge' could not be a property of man. For constructive purposes, on the other hand, see if the name as well be predicated of that of which the description is predicated, and if the description as well be predicated of that
 15 of which the name is predicated. For then what is stated not to be a property will be a property. Thus (e.g.) the predicate 'living creature' is true of that of which 'having a soul' is true, and 'having a soul' is true of that of which the predicate 'living creature' is true; and so 'having a soul' would be a property of 'living creature'.

Next, for destructive purposes, see if he has rendered
 20 a subject as a property of that which is described as 'in the subject': for then what has been stated to be a property will not be a property. Thus (e.g.) inasmuch as he who has rendered 'fire' as the property of 'the body with the most rarefied particles', has rendered the subject as the property of its predicate, 'fire' could not be a property of 'the body with the most rarefied particles'. *The reason*
 why the subject will not be a property of that which is
 25 found in the subject is this, that then the same thing will be the property of a number of things that are specifically different. For the same thing has quite a number of specifically different predicates that belong to it alone, and the subject will be a property of all of these, if any one states the property in this way. For constructive purposes, on the other hand, see if he has rendered what is found in the subject as a property of the sub-
 30 ject: for then what has been stated not to be a property will be a property, if it be predicated only of the things of which it has been stated to be the property. Thus (e.g.) he who has said that it is a property of 'earth' to be 'specifically the heaviest body' has rendered of the subject as its property something that is said of the thing in question alone, and is said of it in the manner in which a property is predicated, and so the property of 'earth' would have been rightly stated.

35 Next, for destructive purposes, see if he has rendered the property as partaken of: for then what is stated to be a property will not be a property. For an attribute of which the

subject partakes is a constituent part of its essence: and an attribute of that kind would be a differentia applying to some one species. E. g., inasmuch as he who has said that 'walking on two feet' is a property of man has rendered the property as partaken of, 'walking on two feet' could not be a property of 'man'. For constructive purposes, on the other hand, see if he has avoided rendering the property as partaken of, or as showing the essence, though the subject is predicated convertibly with it: for then what is stated not to be a property will be a property. Thus (e. g.) he who has stated that to be 'naturally sentient' is a property of 'animal' has rendered the property neither as partaken of nor as showing the essence, though the subject is predicated convertibly with it; and so to be 'naturally sentient' would be a property of 'animal'.

Next, for destructive purposes, see if the property cannot possibly belong simultaneously, but must belong either as posterior or as prior to the attribute described in the name: for then what is stated to be a property will not be a property—either never, or not always. Thus (e. g.) inasmuch as it is possible for the attribute 'walking through the market-place' to belong to an object as prior and as posterior to the attribute 'man', 'walking through the market-place' could not be a property of 'man'—either never, or not always. For constructive purposes, on the other hand, see if it always and of necessity belongs simultaneously, without being either a definition or a differentia: for then what is stated not to be a property will be a property. Thus (e. g.) the attribute 'an animal capable of receiving knowledge' always and of necessity belongs simultaneously with the attribute 'man', and is neither differentia nor definition of its subject, and so 'an animal capable of receiving knowledge' would be a property of 'man'.

Next, for destructive purposes, see if the same thing fails to be a property of things that are the same as the subject, so far as they are the same: for then what is stated to be a property will not be a property. Thus, for example, inasmuch as it is no property of a 'proper object of pursuit' to 'appear good to certain persons', it could not be a property

of the 'desirable' either to 'appear good to certain persons': for 'proper object of pursuit' and 'desirable' mean the same. For constructive purposes, on the other hand, see if the same thing be a property of something that is the same as the subject, in so far as it is the same. For then what is stated
 30 not to be a property will be a property. Thus (e.g.) inasmuch as it is called a property of a man, in so far as he is a man, 'to have a tripartite soul', it would also be a property of a mortal, in so far as he is a mortal, to have a tripartite soul. This commonplace rule is useful also in dealing with Accident: for the same attributes ought either to belong or not belong to the same things, in so far as they are the same.

35 Next, for destructive purposes, see if the property of things that are the same in kind as the subject fails to be always the same in kind as the alleged property: for then
 133^b neither will what is stated to be the property be the property of the subject in question. Thus (e.g.) inasmuch as a man and a horse are the same in kind, and it is not always a property of a horse to stand by its own initiative, it could not be a property of a man to move by his own initiative; for to stand and to move by his own initiative are the
 5 same in kind, because they belong to each of them in so far as each is an 'animal'. For constructive purposes, on the other hand, see if of things that are the same in kind as the subject the property that is the same as the alleged property is always true: for then what is stated not to be a property will be a property. Thus (e.g.) since¹ it is a property of man to be a 'walking biped', it would also be a property of
 10 a bird to be a 'flying biped': for each of these is the same in kind, in so far as the one pair have the sameness of species that fall under the same genus, being under the genus 'animal', while the other pair have that of differentiae of the genus, viz. of 'animal'. This commonplace rule is deceptive whenever one of the properties mentioned belongs to some one species only while the other belongs to many, as does 'walking quadruped'.

15 Inasmuch as 'same' and 'different' are terms used in

¹ 133^b 7. *ἐπεὶ* . . . Or perhaps *ἐάντε*, 'if indeed . . .'

several senses, it is a job to render to a sophistical questioner a property that belongs to one thing and that only. For an attribute that belongs to something qualified by an accident will also belong to the accident taken along with the subject which it qualifies; e. g. an attribute that belongs to 'man' will belong also to 'white man', if there be a white 20 man, and one that belongs to 'white man' will belong also to 'man'. One might, then, bring captious criticism against the majority of properties, by representing the subject as being one thing in itself, and another thing when combined with its accident, saying, for example, that 'man' is one thing, and 'white man' another, and moreover by representing as different a certain state and what is called after that 25 state. For an attribute that belongs to the state will belong also to what is called after that state, and one that belongs to what is called after a state will belong also to the state: e. g. inasmuch as the condition of the scientist is called after his science, it could not be a property of 'science' that it is 'incontrovertible by argument'; for then the scientist also will be incontrovertible by argument. For constructive 30 purposes, however, you should say that the subject of an accident is not absolutely different from the accident taken along with its subject; though it is called 'another' thing because the mode of being of the two is different: for it is not the same thing for a man to be a man and for a white 35 man to be a white man. Moreover, you should take a look along at the inflections, and say that the description of the man of science is wrong: one should say not 'it' but '*he* is 34^a incontrovertible by argument'; while the description of Science is wrong too: one should say not 'it' but '*she* is incontrovertible by argument'. For against an objector who sticks at nothing the defence should stick at nothing.

- 5 Next, for destructive purposes, see if, while intending to render an attribute that naturally belongs, he states it in his language in such a way as to indicate one that invariably belongs: for then it would be generally agreed that what has been stated to be a property is upset. Thus (e. g.) the man who has said that 'biped' is a property of man intends

- 10 to render the attribute that naturally belongs, but his expression actually indicates one that invariably belongs: accordingly, 'biped' could not be a property of man: for not every man is possessed of two feet. For constructive purposes, on the other hand, see if he intends to render the property that naturally belongs, and indicates it in that way in his language: for then the property will not be upset in this respect. Thus (e.g.) he who renders as a property of
 15 'man' the phrase 'an animal capable of receiving knowledge' both intends, and by his language indicates, the property that belongs by nature, and so 'an animal capable of receiving knowledge' would not be upset or shown in that respect not to be a property of man.

Moreover, as regards all the things that are called as they are primarily after something else, or primarily in themselves, it is a job to render the property of such things. For if you
 20 render a property as belonging to the subject that is so called after something else, then it will be true of its primary subject as well; whereas if you state it of its primary subject, then it will be predicated also of the thing that is so called after this other. Thus (e.g.) if any one renders 'coloured' as the property of 'surface', 'coloured' will be true of body as well; whereas if he render it of 'body', it will be pre-
 25 dicated also of 'surface'. Hence the name as well will not be true of that of which the description is true.¹

In the case of some properties it mostly happens that some error is incurred because of a failure to define how as well as to what things the property is stated to belong. For every one tries to render as the property of a thing something that belongs to it either naturally, as 'biped'
 30 belongs to 'man', or actually, as 'having four fingers' belongs to a particular man, or specifically, as 'consisting of most rarefied particles' belongs to 'fire', or absolutely, as 'life' to 'living being', or one that belongs to a thing only as called after something else, as 'wisdom' to the 'soul',

¹ The name 'surface' will not be true of everything of which the description 'coloured' is true, since a body is coloured but is not a surface. The name 'body' will not be true of everything of which the description 'coloured' is true, since a surface is coloured but is not a body.

or on the other hand primarily, as 'wisdom' to the 'rational faculty', or because the thing is in a certain state, as 'incontrovertible by argument' belongs to a 'scientist' (for 35 simply and solely by reason of his being in a certain state will he be 'incontrovertible by argument'), or because it is the state possessed by something, as 'incontrovertible by argument' belongs to 'science', or because it is partaken 134^b of, as 'sensation' belongs to 'animal' (for other things as well have sensation, e. g. man, but they have it because they already partake of 'animal'), or because it partakes of something else, as 'life' belongs to a particular kind of 'living being'. Accordingly he makes a mistake if he has failed to 5 add the word 'naturally', because what belongs naturally may fail to belong to the thing to which it naturally belongs, as (e. g.) it belongs to a man to have two feet: so too he errs if he does not make a definite proviso that he is rendering what actually belongs, because one day that attribute will not be what it now is,¹ e. g. the man's possession of four fingers. So he errs if he has not shown that he states 10 a thing to be such and such primarily, or that he calls it so after something else, because then its name too will not be true of that of which the description is true, as is the case with 'coloured', whether rendered as a property of 'surface' or of 'body'. So he errs if he has not said beforehand that he has rendered a property to a thing either because that thing possesses a state, or because it is a state possessed by something; because then it will not be a property. For, sup- 15 posing he renders the property to something as being a state possessed, it will belong to what possesses that state; while supposing he renders it to what possesses the state, it will belong to the state possessed, as did 'incontrovertible by argument' when stated as a property of 'science' or of the 'scientist'. So he errs if he has not indicated beforehand that the property belongs because the thing partakes of, or is partaken of by, something; because then the property will belong to certain other things as well. For if he renders it 20 because its subject is partaken of, it will belong to the things

¹ Or (reading *οἷον ὑπάρχειν ἐκείνῳ*, with A) 'because one day that attribute will not be such as can belong to that subject'.

which partake of it ; whereas if he renders it because its subject partakes of something else, it will belong to the things partaken of, as (e. g.) if he were to state ' life ' to be a property of a ' particular kind of living being ', or just of ' living being '. So he errs if he has not expressly distinguished the property that belongs specifically, because then it will belong only to one of the things that fall under the term of which he states the property: for the superlative belongs only to one of
 25 them, e. g. ' lightest ' as applied to ' fire '. Sometimes, too, a man may even add the word ' specifically ', and still make a mistake. For the things in question should all be of one species, whenever the word ' specifically ' is added: and in some cases this does not occur, as it does not, in fact, in the case of fire. For fire is not all of one species; for live coals and flame and light are each of them ' fire ', but are of
 30 different species. The reason why, whenever ' specifically ' is added, there should not be any species other than the one mentioned, is this, that if there be, then the property in question will belong to some of them in a greater and to others in a less degree, as happens with ' consisting of most rarefied particles ' in the case of fire: for ' light ' consists of more rarefied particles than live coals and flame. And this
 35 should not happen unless the name too be predicated in a greater degree of that of which the description is truer; otherwise the rule that where the description is truer the
 135^a name too should be truer is not fulfilled. Moreover, in addition to this, the same attribute will be the property both of the term which has it absolutely and of that element therein which has it¹ in the highest degree, as is the condition of the property ' consisting of most rarefied particles ' in the case of ' fire ': for this same attribute will be the
 5 property of ' light ' as well: for it is ' light ' that ' consists of the most rarefied particles '. If, then, any one else renders a property in this way one should attack it; for oneself, one should not give occasion for this objection, but should define in what manner one states the property at the actual time of making the statement.

Next, for destructive purposes, see if he has stated a thing

¹ 135^a 3. Read τοιούτων (with A, B, and u) for τοιούτω.

as a property of itself: for then what has been stated to be ¹⁰ a property will not be a property. For a thing itself always shows its own essence, and what shows the essence is not a property but a definition. Thus (e.g.) he who has said that 'becoming' is a property of 'beautiful' has rendered the term as a property of itself (for 'beautiful' and 'becoming' are the same); and so 'becoming' could not be a property of 'beautiful'. For constructive purposes, on the other ¹⁵ hand, see if he has avoided rendering a thing as a property of itself, but has yet stated a convertible predicate: for then what is stated not to be a property will be a property. Thus he who has stated 'animate substance' as a property of 'living-creature' has not stated 'living-creature' as a property of itself, but has rendered a convertible predicate, so that 'animate substance' would be a property of 'living-creature'.

Next, in the case of things consisting of like parts, you ²⁰ should look and see, for destructive purposes, if the property of the whole be not true of the part, or if that of the part be not predicated of the whole: for then what has been stated to be the property will not be a property. In some cases it happens that this is so: for sometimes in rendering a property in the case of things that consist of like parts ²⁵ a man may have his eye on the whole, while sometimes he may address himself to what is predicated of the part: and then in neither case will it have been rightly rendered. Take an instance referring to the whole: the man who has said that it is a property of the 'sea' to be 'the largest volume of salt water', has stated the property of something that consists of like parts, but has rendered an attribute of such a kind as is not true of the part (for a particular sea is ³⁰ not 'the largest volume of salt water'); and so 'the largest volume of salt water' could not be a property of the 'sea'. Now take one referring to the part: the man who has stated that it is a property of 'air' to be 'breathable' has stated the property of something that consists of like parts, but he has stated an attribute such as, though true of some ³⁵ air, is still not predicable of the whole (for the whole of the air is not breathable); and so 'breathable' could not be a property of 'air'. For constructive purposes, on the ¹³⁵^b

other hand, see whether, while it is true of each of the things with similar parts, it is on the other hand a property of them taken as a collective whole: for then what has been stated not to be a property will be a property. Thus (e.g.) while it is true of earth everywhere that it naturally falls downwards, it is a property of the various particular pieces of earth taken as 'the Earth',¹ so that it would be a property of 'earth' 'naturally to fall downwards'.

Next, look from the point of view of the respective opposites, and first (*a*) from that of the contraries, and see, for destructive purposes, if the contrary of the term rendered fails to be a property of the contrary subject. For then neither will the contrary of the first be a property of the contrary of the second. Thus (e.g.) inasmuch as injustice is contrary to justice, and the lowest evil to the highest good, but 'to be the highest good' is not a property of 'justice', therefore 'to be the lowest evil' could not be a property of 'injustice'. For constructive purposes, on the other hand, see if the contrary is the property of the contrary: for then also the contrary of the first will be the property of the contrary of the second. Thus (e.g.) inasmuch as evil is contrary to good, and objectionable to desirable, and 'desirable' is a property of 'good', 'objectionable' would be a property of 'evil'.

Secondly (*b*) look from the point of view of relative opposites and see, for destructive purposes, if the correlative of the term rendered fails to be a property of the correlative of the subject: for then neither will the correlative of the first be a property of the correlative of the second. Thus (e.g.) inasmuch as 'double' is relative to 'half', and 'in excess' to 'exceeded', while 'in excess' is not a property of 'double', 'exceeded' could not be a property of 'half'. For constructive purposes, on the other hand, see if the correlative of the alleged property is a property of the subject's correlative: for then also the correlative of the first will be a property of the correlative of the second:

¹ 135^b 4-5. Read in l. 4, *κατὰ πάσης γῆς*, and in l. 5, *καὶ τῆς καὶ τῆς τινὸς γῆς κατὰ τὴν γῆν*.

e.g. inasmuch as 'double' is relative to 'half', and the proportion 1 : 2 is relative to the proportion 2 : 1,¹ while it ¹⁵ is a property of 'double' to be 'in the proportion of 2 to 1', it would be a property of 'half' to be 'in the proportion of 1 to 2'.

Thirdly (c) for destructive purposes, see if an attribute described in terms of a state (X) fails to be a property of the given state (Y): for then neither will the attribute described in terms of the privation (of X) be a property of the privation (of Y). Also if, on the other hand, an attribute described in terms of the privation (of X) be not a ³⁰ property of the given privation (of Y), neither will the attribute described in terms of the state (X) be a property of the state (Y). Thus, for example, inasmuch as it is not predicated as a property of 'deafness' to be a 'lack of sensation', neither could it be a property of 'hearing' to be a 'sensation'. For constructive purposes, on the other hand, see if an attribute described in terms of a state (X) is a property of the given state (Y): for then also the attribute that is described in terms of the privation (of X) will be a property of the privation (of Y). Also, if an attribute ³⁵ described in terms of a privation (of X) be a property of the privation (of Y), then also the attribute that is described ^{136^a} in terms of the state (X) will be a property of the state (Y). Thus (e.g.) inasmuch as 'to see' is a property of 'sight', inasmuch as we have sight, 'failure to see' would be a property of 'blindness', inasmuch as we have not got the sight we should naturally have.

Next, look from the point of view of positive and negative ⁵ terms; and first (a) from the point of view of the predicates taken by themselves. This common-place rule is useful only for a destructive purpose. Thus (e.g.) see if the positive term or the attribute described in terms of it is a property of the subject: for then the negative term or the attribute described in terms of it will not be a property of the subject. ¹⁰ Also if, on the other hand, the negative term or the attribute described in terms of it is a property of the subject, then the positive term or the attribute described in terms of it will not

¹ 135^b 24. Read (after *ἡμισυ*) τὸ δὲ ἐν πρὸς δύο πρὸς τὸ δύο πρὸς ἑν.

be a property of the subject: e.g. inasmuch as 'animate' is a property of 'living creature', 'inanimate' could not be a property of 'living creature'.

Secondly (*b*) look from the point of view of the predicates,
 15 positive or negative, and their respective subjects; and see, for destructive purposes, if the positive term fails to be a property of the positive subject: for then neither will the negative term be a property of the negative subject. Also, if the negative term fails to be a property of the negative subject, neither will the positive term be a property of the positive subject. Thus (e.g.) inasmuch as 'animal' is not a property of 'man', neither could 'not-animal' be a pro-
 20 perty of 'not-man'. Also if 'not-animal' seems not to be a property of 'not-man', neither will 'animal' be a property of 'man'. For constructive purposes, on the other hand, see if the positive term is a property of the positive subject: for then the negative term will be a property of the negative subject as well. Also if the negative term be a property of the negative subject, the positive will be a property of
 25 the positive as well. Thus (e.g.) inasmuch as it is a property of 'not-living being' 'not to live', it would be a property of 'living being' 'to live': also if it seems to be a property of 'living being' 'to live', it will also seem to be a property of 'not-living being' 'not to live'.

Thirdly (*c*) look from the point of view of the subjects taken by themselves, and see, for destructive purposes, if
 30 the property rendered is a property of the positive subject: for then the same term will not be a property of the negative subject as well. Also, if the term rendered be a property of the negative subject, it will not be a property of the positive. Thus (e.g.) inasmuch as 'animate' is a property of 'living creature', 'animate' could not be a property of 'not-living creature'. For constructive purposes,² on the other hand, if the term rendered fails to be a property of
 35 the affirmative subject it would be a property of the negative. This commonplace rule is, however, deceptive: for a positive term is not a property of a negative, or a negative

¹ 136^a 15. Read καὶ ἐξ ὧν κατηγορεῖται.

² 136^a 34. Read κατασκευάζονται.

of a positive. For a positive term does not belong at all to a negative, while a negative term, though it belongs to 136^b a positive, does not belong as a property.

Next, look from the point of view of the co-ordinate members of a division, and see, for destructive purposes, if none of the co-ordinate members (parallel with the property rendered) be a property of any of the remaining set of co-ordinate members (parallel with the subject): for then 5 neither will the term stated be a property of that of which it is stated to be a property. Thus (e.g.) inasmuch as 'sensible living being' is not a property of any of the other living beings,¹ 'intelligible living being' could not be a property of God. For constructive purposes, on the other hand, see if some one or other of the remaining co-ordinate members (parallel with the property rendered) be a property of each of these co-ordinate members (parallel with the subject): for then the remaining one too will be a property 10 of that of which it has been stated not to be a property. Thus (e.g.) inasmuch as it is a property of 'wisdom' to be essentially 'the natural virtue of the rational faculty', then, taking each of the other virtues as well in this way, it would be a property of 'temperance' to be essentially 'the natural virtue of the faculty of desire'.

- 7 Next, look from the point of view of the inflexions, and 15 see, for destructive purposes, if the inflexion of the property rendered fails to be a property of the inflexion of the subject: for then neither will the other inflexion be a property of the other inflexion. Thus (e.g.) inasmuch as 'beautifully' is not a property of 'justly', neither could 'beautiful' be a property of 'just'. For constructive purposes, on the other hand, see if the inflexion of the property rendered is a property of the inflexion of the subject: for then also the other inflexion will be a property of the other inflexion. Thus (e.g.) inasmuch as 'walking biped' is a property of 20 man, it would also be any one's property 'as a man' to be described 'as a walking biped'. Not only in the case of the actual term mentioned should one look at the inflexions,

¹ 136^b 6. Omit *θυγατρων*.

but also in the case of its opposites, just as has been laid down in the case of the former commonplace rules as well.¹

25 Thus, for destructive purposes, see if the inflexion of the opposite of the property rendered fails to be the property of the inflexion of the opposite of the subject: for then neither will the inflexion of the other opposite be a property of the inflexion of the other opposite. Thus (e.g.) inasmuch as 'well' is not a property of 'justly', neither could 'badly' be a property of 'unjustly'. For constructive purposes, on the other hand, see if the inflexion of the opposite of the property originally suggested is a property of the inflexion
30 of the opposite of the original subject: for then also the inflexion of the other opposite will be a property of the inflexion of the other opposite. Thus (e.g.) inasmuch as 'best' is a property of 'the good', 'worst' also will be a property of 'the evil'.

Next, look from the point of view of things that are in a like relation, and see, for destructive purposes, if what is in a relation like that of the property rendered fails to be a property of what is in a relation like that of the subject: for then neither will what is in a relation like that of the
35 first be a property of what is in a relation like that of the second. Thus (e.g.) inasmuch as the relation of the builder towards the production of a house is like that of the doctor towards the production of health, and it is not
137^a a property of a doctor to produce health, it could not be a property of a builder to produce a house. For constructive purposes, on the other hand, see if what is in a relation like that of the property rendered is a property of what is in a relation like that of the subject: for then also what is in a relation like that of the first will be a property of what is in a relation like that of the second. Thus (e.g.) inasmuch as the relation of a doctor towards the possession of ability to produce health is like that of
5 a trainer towards the possession of ability to produce vigour, and it is a property of a trainer to possess the ability to produce vigour, it would be a property of a doctor to possess the ability to produce health.

¹ 114^b 6-15.

Next look from the point of view of things that are identically related, and see, for destructive purposes, if the predicate that is identically related towards two subjects fails to be a property of the subject which is identically related to it as the subject in question; for then neither will the predicate that is identically related to both subjects 10 be a property of the subject which is identically related to it as the first. If, on the other hand, the predicate which is identically related to two subjects is the property of the subject which is identically related to it as the subject in question, then it will not be a property of that of which it has been stated to be a property. [Thus (e.g.) inasmuch as prudence is identically related to both the noble and the base, since it is knowledge of each of them, and it is not a property of prudence to be knowledge of the noble, it could not be a property of prudence to be knowledge of 15 the base. If, on the other hand, it is a property of prudence to be the knowledge of the noble, it could not be a property of it to be the knowledge of the base.¹] For it is impossible for the same thing to be a property of more than one subject. For constructive purposes, on the other hand, this commonplace rule is of no use: for what is 'identically related' is a single predicate in process of comparison with more than 20 one subject.

Next, for destructive purposes, see if the predicate qualified by the verb 'to be' fails to be a property of the subject qualified by the verb 'to be': for then neither will the destruction of the one be a property of the other qualified by the verb 'to be destroyed', nor will the 'becoming' the one be a property of the other qualified by the verb 'to become'. Thus (e.g.) inasmuch as it is not a property of 'man' to be an animal, neither could it be a property of becoming a man to become an animal; nor could the 25 destruction of a man be a property of the destruction of a man. In the same way one should derive arguments also from 'becoming' to 'being' and 'being destroyed', and from 'being destroyed' to 'being' and to 'becoming', exactly as

¹ 137^a 12 οἷον ἐπεὶ . . . 17 εἶναι αἰσχροῦ. These illustrations are bracketed, with Pacius, as a later and inept addition.

30 they have just been given from 'being' to 'becoming' and 'being destroyed'. For constructive purposes, on the other hand, see if the subject set down as qualified by the verb 'to be' has the predicate set down as so qualified, as its property: for then also the subject qualified by the verb 'to become' will have the predicate qualified by 'to become' as its property, and the subject qualified by the verb 'to be destroyed' will have as its property the predicate rendered with this qualification. Thus, for example, inasmuch as it
 35 is a property of man to be a mortal, it would be a property of becoming a man to become a mortal, and the destruction of a mortal would be a property of the destruction of a man.
 137^b In the same way one should derive arguments also from 'becoming' and 'being destroyed' both to 'being' and to the conclusions that follow from them, exactly as was directed also for the purpose of destruction.

Next take a look at the 'idea' of the subject stated, and see, for destructive purposes, if the suggested property fails to belong to the 'idea' in question, or fails to belong to it
 5 in virtue of that character which causes it to bear the description of which the property was rendered: for then what has been stated to be a property will not be a property. Thus (e.g.) inasmuch as 'being motionless' does not belong to 'man-himself' *qua* 'man', but *qua* 'idea', it could not be a property of 'man' to be motionless. For constructive purposes, on the other hand, see if the property in question belongs to the idea, and belongs to it in that respect in virtue of which there is predicated of it that character¹ of
 10 which the predicate in question has been stated not to be a property: for then what has been stated not to be a property will be a property. Thus (e.g.) inasmuch as it belongs to 'living-creature-itself' to be compounded of soul and body, and further this belongs to it *qua* 'living-creature', it would be a property of 'living-creature' to be compounded of soul and body.

Next look from the point of view of greater and less 8
 15 degrees, and first (a) for destructive purposes, see if what

¹ 137^b 10. Adopting Mr. W. D. Ross's emendation *ἐκείνο*.

is more-P fails to be a property of what is more-S: for then neither will what is less-P be a property of what is less-S, nor least-P of least-S, nor most-P of most-S, nor P simply of S simply. Thus (e.g.) inasmuch as being more highly coloured is not a property of what is more a body, neither could being less highly coloured be a property of what is 20 less a body, nor being coloured be a property of body at all. For constructive purposes, on the other hand, see if what is more-P is a property of what is more-S: for then also what is less-P will be a property of what is less-S, and least-P of least-S, and most-P of most-S, and P simply of S simply. Thus (e.g.) inasmuch as a higher degree of sensation is a property of a higher degree of life, a lower degree of sensation also would be a property of a lower 25 degree of life, and the highest of the highest and the lowest of the lowest degree, and sensation simply of life simply.

Also you should look at the argument from a simple predication to the same qualified types of predication, and see, for destructive purposes, if P simply fails to be a property of S simply; for then neither will more-P be 30 a property of more-S, nor less-P of less-S, nor most-P of most-S, nor least-P of least-S. Thus (e.g.) inasmuch as 'virtuous' is not a property of 'man', neither could 'more virtuous' be a property of what is 'more human'. For constructive purposes, on the other hand, see if P simply is a property of S simply: for then more-P also will be a property of more-S, and less-P of less-S, and least-P of 35 least-S, and most-P of most-S. Thus (e.g.) a tendency to move upwards by nature is a property of fire, and so also a greater tendency to move upwards by nature would be 138^a a property of what is more fiery. In the same way too one should look at all these matters from the point of view of the others as well.

Secondly (*b*) for destructive purposes, see if the more likely property fails to be a property of the more likely subject: for then neither will the less likely property be 5 a property of the less likely subject. Thus (e.g.) inasmuch as 'perceiving' is more likely to be a property of 'animal' than 'knowing' of 'man', and 'perceiving' is not a property

of 'animal', 'knowing' could not be a property of 'man'. For constructive purposes, on the other hand, see if the less likely property is a property of the less likely subject; for then too the more likely property will be a property of the
 10 more likely subject. Thus (e.g.) inasmuch as 'to be naturally civilized' is less likely to be a property of man than 'to live' of an animal, and it is a property of man to be naturally civilized, it would be a property of animal to live.

Thirdly (c) for destructive purposes, see if the predicate fails to be a property of that of which it is more likely to be a property: for then neither will it be a property of that of which it is less likely to be a property: while if it is
 15 a property of the former, it will not be a property of the latter. Thus (e.g.) inasmuch as 'to be coloured' is more likely to be a property of a 'surface' than of a 'body', and it is not a property of a surface, 'to be coloured' could not be a property of 'body'; while if it is a property of a 'surface', it could not be a property of a 'body'. For constructive purposes, on the other hand, this commonplace
 20 rule is not of any use: for it is impossible for the same thing to be a property of more than one thing.

Fourthly (d) for destructive purposes, see if what is more likely to be a property of a given subject fails to be its property: for then neither will what is less likely to be a property of it be its property. Thus (e.g.) inasmuch as 'sensible' is more likely than 'divisible' to be a property of 'animal', and 'sensible' is not a property of animal,
 25 'divisible' could not be a property of animal. For constructive purposes, on the other hand, see if what is less likely to be a property of it is a property; for then what is more likely to be a property of it will be a property as well. Thus, for example, inasmuch as 'sensation' is less likely to be a property of 'animal' than 'life', and 'sensation' is a property of animal, 'life' would be a property of animal.

30 Next, look from the point of view of the attributes that belong in a like manner, and first (α) for destructive purposes, see if what is as much a property fails to be a property of that of which it is as much a property: for

then neither will that which is as much a property as it be a property of that of which it is as much a property. Thus (e.g.) inasmuch as 'desiring' is as much a property of the faculty of desire as 'reasoning' is a property of the faculty of reason, and desiring is not a property of the 35 faculty of desire, reasoning could not be a property of the faculty of reason. For constructive purposes, on the other hand, see if what is as much a property is a property of that of which it is as much a property: for then also what is as much a property as it will be a property of that 138^b of which it is as much a property. Thus (e.g.) inasmuch as it is as much a property of 'the faculty of reason' to be 'the primary seat of wisdom' as it is of 'the faculty of desire' to be 'the primary seat of temperance', and it is a property of the faculty of reason to be the primary seat of wisdom, it would be a property of the faculty of desire to be the primary seat of temperance. 5

Secondly (*b*) for destructive purposes, see if what is as much a property of anything fails to be a property of it: for then neither will what is as much a property be a property of it. Thus (e.g.) inasmuch as 'seeing' is as much a property of man as 'hearing', and 'seeing' is not a property of man, 'hearing' could not be a property of man. For constructive purposes, on the other hand, see if 10 what is as much a property of it is its property: for then what is as much a property of it as the former will be its property as well. Thus (e.g.) it is as much a property of the soul to be the primary possessor of a part that desires as of a part that reasons, and it is a property of the soul to be the primary possessor of a part that desires, and so it would be a property of the soul to be the primary possessor 15 of a part that reasons.

Thirdly (*c*) for destructive purposes, see if it fails to be a property of that of which it is as much a property: for then neither will it be a property of that of which it is as much a property as of the former, while if it be a property of the former, it will not be a property of the other. Thus (e.g.) inasmuch as 'to burn' is as much a property of 'flame' as of 'live coals', and 'to burn' is not a property

10 of flame, 'to burn' could not be a property of live coals: while if it *is* a property of flame, it could not be a property of live coals. For constructive purposes, on the other hand, this commonplace rule is of no use.

The rule based on things that are in a like relation¹ differs from the rule based on attributes that belong in a like manner,² because the former point is secured by analogy,
 25 not from reflection on the belonging of any attribute, while the latter is judged by a comparison based on the fact that an attribute belongs.

Next, for destructive purposes, see if in rendering the property potentially, he has also through that potentiality rendered the property relatively to something that does not exist, when the potentiality in question cannot belong
 30 to what does not exist: for then what is stated to be a property will not be a property. Thus (e.g.) he who has said that 'breathable' is a property of 'air' has, on the one hand, rendered the property potentially (for that is 'breathable' which is such as can be breathed), and on the other hand has also rendered the property relatively to what does not exist:—for while air may exist, even though there exist no animal so constituted as to breathe the air,
 35 it is not possible to breathe it if no animal exist: so that it will not, either, be a property of air to be such as can be breathed at a time when there exists no animal such as to breathe it—and so it follows that 'breathable' could not be a property of air.

139^a For constructive purposes, see if in rendering the property potentially he renders the property either relatively to something that exists, or to something that does not exist, when the potentiality in question can belong to what does not exist: for then what has been stated not to be a property will be a property. Thus (e.g.) he who renders it as a
 5 property of 'being' to be 'capable of being acted upon or of acting', in rendering the property potentially, has rendered the property relatively to something that exists: for when 'being' exists, it will also be capable of being acted upon or of acting in a certain way: so that to be

¹ 136^b 33–137^a 7.

² 138^a 30–^b 22.

'capable of being acted upon or of acting' would be a property of 'being'.

Next, for destructive purposes, see if he has stated the property in the superlative: for then what has been stated ¹⁰ to be a property will not be a property. For people who render the property in that way find that of the object of which the description is true, the name is not true as well: for though the object perish the description will continue in being none the less; for it belongs most nearly to something that is in being. An example would be supposing any one were to render 'the lightest body' as a property of 'fire': for, though fire perish, there will still be some form ¹⁵ of body that is the lightest, so that 'the lightest body' could not be a property of fire. For constructive purposes, on the other hand, see if he has avoided rendering the property in the superlative: for then the property will in this respect have been correctly stated. Thus (e.g.) inasmuch as he who states 'a naturally civilized animal' as a property of man has not rendered the property in the superlative, the property would in this respect have been ²⁰ correctly stated.

BOOK VI

139^a THE discussion of Definitions falls into five parts. For
 25 you have to show either (1) that it is not true at all to
 apply the expression as well to that to which the term is
 applied (for the definition of Man ought to be true of every
 man); or (2) that though the object has a genus, he has
 failed to put the object defined into the genus, or to put it
 into the appropriate genus (for the framer of a definition
 30 should first place the object in its genus, and then append
 its differences: for of all the elements of the definition the
 genus is usually supposed to be the principal mark of the
 essence of what is defined): or (3) that the expression is
 not peculiar to the object (for, as we said above as well,¹
 a definition ought to be peculiar)²: or else (4) see if, though
 he has observed all the aforesaid cautions, he has yet failed
 to define the object, that is, to express its essence. (5) It
 remains, apart from the foregoing, to see if he has defined it,
 35 but defined it incorrectly.

Whether, then, the expression be not also true of that of
 which the term is true you should proceed to examine
 according to the commonplace rules that relate to Acci-
 dent. For there too the question is always 'Is so and so
 true or untrue?': for whenever we argue that an accident
 139^b belongs, we declare it to be true, while whenever we argue
 that it does not belong, we declare it to be untrue. If,
 again, he has failed to place the object in the appropriate
 genus, or if the expression be not peculiar to the object, we
 must go on to examine the case according to the common-
 5 place rules that relate to genus and property.

It remains, then, to prescribe how to investigate whether
 the object has been either not defined at all, or else defined
 incorrectly. First, then, we must proceed to examine if it
 has been defined incorrectly: for with anything it is easier
 to do it than to do it correctly. Clearly, then, more mistakes

¹ 101^b 19.

² The bracket which begins at δει γάρ . . . (l. 31) should be closed
 after εἴηται (l. 32).

are made in the latter task on account of its greater difficulty. Accordingly the attack becomes easier in the latter case than 10 in the former.

Incorrectness falls into two branches: (1) first, the use of obscure language (for the language of a definition ought to be the very clearest possible, seeing that the whole purpose of rendering it is to make something known); (2) secondly, 15 if the expression used be longer than is necessary: for all additional matter in a definition is superfluous. Again, each of the aforesaid branches is divided into a number of others.

- 2 One commonplace rule, then, in regard to obscurity is, See if the meaning intended by the definition involves an ambiguity with any other, e.g. 'Becoming is a passage into being', or 'Health is the balance of hot and cold elements'. Here 'passage' and 'balance' are ambiguous terms: it is accordingly not clear which of the several possible senses of the term he intends to convey. Likewise also, if the term defined be used in different senses and he has spoken without distinguishing between them: for then it is not clear to 25 which of them the definition rendered applies, and one can then bring a captious objection on the ground that the definition does not apply to all the things whose definition he has rendered: and this kind of thing is particularly easy in the case where the definer does not see the ambiguity of his terms. Or, again, the questioner may himself distinguish the various senses of the term rendered in the definition, and then institute his argument against each: for if the 30 expression used be not adequate to the subject in any of its senses, it is clear that he cannot have defined it in any sense aright.

Another rule is, See if he has used a metaphorical expression, as, for instance, if he has defined knowledge as 'unsupplantable', or the earth as a 'nurse', or temperance as a 'harmony'. For a metaphorical expression is always obscure. It is possible, also, to argue sophistically against 35 the user of a metaphorical expression¹ as though he had

¹ 139^b 35. Read τὸν μεταφορὰν εἰπόντα.

used it in its literal sense: for the definition stated will not apply to the term defined, e.g. in the case of temperance: for harmony is always found between notes. Moreover, if harmony be the genus of temperance, then the same object
 140^a will occur in two genera of which neither contains the other: for harmony does not contain virtue, nor virtue harmony. Again, see if he uses terms that are unfamiliar, as when Plato describes¹ the eye as 'brow-shaded', or a certain spider
 5 as 'poison-fanged', or the marrow as 'bone-formed'. For an unusual phrase is always obscure.

Sometimes a phrase is used neither ambiguously, nor yet metaphorically, nor yet literally, as when the law is said to be the 'measure' or 'image' of the things that are by nature just. Such phrases are worse than metaphor; for the latter
 10 does make its meaning to some extent clear because of the likeness involved; for those who use metaphors do so always in view of some likeness: whereas this kind of phrase makes nothing clear; for there is no likeness to justify the description 'measure' or 'image', as applied to the law, nor is the law ordinarily so called in a literal sense. So then, if a man
 15 speaks falsely: for an image is something produced by imitation, and this is not found in the case of the law. If, on the other hand, he does not mean the term literally, it is clear that he has used an unclear expression, and one that is worse than any sort of metaphorical expression.

Moreover, see if from the expression used the definition of the contrary be not clear; for definitions that have been correctly rendered also indicate their contraries as well.
 20 Or, again, see if, when it is merely stated by itself, it is not evident what it defines: just as in the works of the old painters, unless there were an inscription, the figures used to be unrecognizable.

If, then, the definition be not clear, you should proceed to 3 examine on lines such as these. If, on the other hand, he has phrased the definition redundantly, first of all look

¹ Not in his extant works; perhaps in his early poems. Or the reference may be to Plato the comic poet.

and see whether he has used any attribute that belongs ²⁵ universally, either to real objects in general, or to all that fall under the same genus as the object defined: for the mention of this is sure to be redundant. For the genus ought to divide the object from things in general, and the differentia from any of the things contained in the same genus. Now any term that belongs to everything separates off the given object from absolutely nothing, while any that belongs to all the things that fall under the same genus ³⁰ does not separate it off from the things contained in the same genus. Any addition, then, of that kind will be pointless.

Or see if, though the additional matter may be peculiar to the given term, yet even when it is struck out the rest of the expression too is peculiar and makes clear the essence of the term. Thus, in the definition of man, the addition ³⁵ 'capable of receiving knowledge' is superfluous; for strike it out, and still the expression is peculiar and makes clear his essence. Speaking generally, everything is superfluous ^{140^b} upon whose removal the remainder still makes the term that is being defined clear. Such, for instance, would also be the definition of the soul, assuming it to be stated as a 'self-moving number';¹ for the soul is just 'the self-moving', as Plato defined it.² Or perhaps the expression used, though appropriate, yet does not declare the essence, if the word 'number' be eliminated. Which of the two is ⁵ the real state of the case it is difficult to determine clearly: the right way to treat the matter in all cases is to be guided by convenience. Thus (e.g.) it is said that the definition of phlegm is the 'undigested moisture that comes first off food'. Here the addition of the word 'undigested' is superfluous, seeing that 'the first' is one and not many, so that even when 'undigested' is left out the definition will still be peculiar ¹⁰ to the subject: for it is impossible that both phlegm and also something else should both be the first to arise from the food. Or perhaps the phlegm is not absolutely the first thing to come off the food, but only the first of the undigested matters, so that the addition 'undigested' is

¹ Xenocrates, fr. 60 Heinze.

² *Phaedr.* 245 E.

required ; for stated the other way the definition would not
 15 be true unless the phlegm comes first of all.

Moreover, see if anything contained in the definition fails
 to apply to everything that falls under the same species :
 for this sort of definition is worse than those which include
 an attribute belonging to all things universally. For in
 that case, if the remainder of the expression be peculiar,
 the whole too will be peculiar : for absolutely always, if to
 20 something peculiar anything whatever that is true be added,
 the whole too becomes peculiar. Whereas if any part of
 the expression do not apply to everything that falls under
 the same species, it is impossible that the expression as
 a whole should be peculiar : for it will not be predicated
 convertibly with the object ; e.g. ' a walking biped animal
 six feet high ' : for an expression of that kind is not predi-
 25 cated convertibly with the term, because the attribute ' six
 feet high ' does not belong to everything that falls under
 the same species.

Again, see if he has said the same thing more than once,
 saying (e.g.) ' desire ' is a ' conation for the pleasant '. For
 ' desire ' is always ' for the pleasant ', so that what is the
 same as desire will also be ' for the pleasant '. Accordingly
 30 our definition of desire becomes ' conation-for-the-pleasant
 for the pleasant ' : for the word ' desire ' is the exact equi-
 valent of the words ' conation-for-the-pleasant ', so that both
 alike will be ' for the pleasant '. Or perhaps there is no
 absurdity in this ; for consider this instance :—' Man is a
 biped ' : therefore, what is the same as man is a biped : but
 ' a walking biped animal ' is the same as man, and therefore
 35 ' a walking biped animal is a biped '. But this involves no
 real absurdity. For ' biped ' is not a *predicate* of ' walking
 animal ' : if it were, then we should certainly have ' biped '
 predicated twice of the same thing ; but as a matter of fact
 141^a the subject said to be a biped is ' a walking biped animal ',
 so that the word ' biped ' is only used as a predicate once.
 Likewise also in the case of ' desire ' as well : for it is not
 ' conation ' that is said to be ' for the pleasant ', but rather
 the whole idea, so that there too the predication is only
 5 made once. Absurdity results, not when the same word is

uttered twice, but when the same thing is more than once predicated of a subject; e.g. if he says, like Xenocrates,¹ that wisdom defines and contemplates reality:² for definition is a certain type of contemplation, so that by adding the words 'and contemplates' over again he says the same thing twice over. Likewise, too, those fail who say that 'cooling' is 'the privation of natural heat'. For all privation is a privation of some natural attribute, so that the addition of the word 'natural' is superfluous: it would have been enough to say 'privation of heat', for the word 'privation' shows of itself that the heat meant is natural heat.

Again, see if a universal have been mentioned and then ¹⁵ a particular case of it be added as well, e.g. 'Equity is a remission of what is expedient and just'; for what is just is a branch of what is expedient and is therefore included in the latter term: its mention is therefore redundant, an addition of the particular after the universal has been already stated. So also, if he defines 'medicine' as 'knowledge of what makes for health in animals and men', or 'the law' as 'the image of what is by nature noble and ²⁰ just'; for what is just is a branch of what is noble, so that he says the same thing more than once.

- 4 Whether, then, a man defines a thing correctly or incorrectly you should proceed to examine on these and similar lines. But whether he has mentioned and defined its essence or no, should be examined as follows:—

First of all, see if he has failed to make the definition through terms that are prior and more intelligible. For the reason why the definition is rendered is to make known the term stated, and we make things known by taking not any random terms, but such as are prior and more intelligible, as is done in demonstrations (for so it is with all ³⁰ teaching and learning); accordingly, it is clear that a man who does not define through terms of this kind has not defined at all. Otherwise, there will be more than one definition of the same thing: for clearly he who defines

¹ 141^a 6. Read *οἷον εἰ ὡς Ξενοκράτης*.

² Fr. 7 Heinze.

through terms that are prior and more intelligible has also framed a definition, and a better one, so that both would then be definitions of the same object. This sort of view, 35 however, does not generally find acceptance: for of each real object the essence is single: if, then, there are to be a number of definitions of the same thing, the essence of the object will be the same as it is represented to be in each of the definitions, and these representations are not 141^b the same, inasmuch as the definitions are different. Clearly, then, any one who has not defined a thing through terms that are prior and more intelligible has not defined it at all.

The statement that a definition has not been made through more intelligible terms may be understood in two senses, either supposing that its terms are absolutely less intelligible, or supposing that they are less intelligible to us: for 5 either sense is possible. Thus absolutely the prior is more intelligible than the posterior, a point, for instance, than a line, a line than a plane, and a plane than a solid; just as also a unit is more intelligible than a number; for it is the prius and starting-point of all number. Likewise, also, a letter is more intelligible than a syllable. Whereas to us it sometimes happens that the converse is the case: for 10 the solid falls under perception most of all—more than a plane¹—and a plane more than a line, and a line more than a point; for most people learn things like the former earlier than the latter; for any ordinary intelligence can grasp them, whereas the others require an exact and exceptional understanding.

15 Absolutely, then, it is better to try to make what is posterior known through what is prior, inasmuch as such a way of procedure is more scientific. Of course, in dealing with persons who cannot recognize things through terms of that kind, it may perhaps be necessary to frame the expression through terms that are intelligible to them.

Among definitions of this kind are those of a point, a line, 20 and a plane, all of which explain the prior by the posterior; for they say that a point is the limit of a line, a line of a plane, a plane of a solid. One must, however, not fail to

¹ 141^b 11. Read *πίπτει ἐντεταμένον*.

observe that those who define in this way cannot show the essential nature of the term they define, unless it so happens that the same thing is more intelligible both to us and also ²⁵ absolutely, since a correct definition must define a thing through its genus and its differentiae, and these belong to the order of things which are absolutely more intelligible than, and prior to, the species. For annul the genus and differentia, and the species too is annulled, so that these are prior to the species. They are also more intelligible; for if the species be known, the genus and differentia must of ³⁰ necessity be known as well (for any one who knows what a man is knows also what 'animal' and 'walking' are), whereas if the genus or the differentia be known it does not follow of necessity that the species is known as well: thus the species is less intelligible. Moreover, those who say that such definitions, viz. those which proceed from ³⁵ what is intelligible to this, that, or the other man, are really and truly definitions, will have to say that there are several definitions of one and the same thing. For, as it happens, different things are more intelligible to different people, not the same things to all; and so a different definition would ^{142^a} have to be rendered to each several person, if the definition is to be constructed from what is more intelligible to particular individuals. Moreover, to the same people different things are more intelligible at different times; first of all the objects of sense; then, as they become more sharp-witted, the converse; so that those who hold that a definition ought to be rendered through what is more intelligible ⁵ to particular individuals would not have to render the same definition at all times even to the same person. It is clear, then, that the right way to define is not through terms of that kind, but through what is absolutely more intelligible: for only in this way could the definition come always to be one and the same. Perhaps, also, what is absolutely intelligible is what is intelligible, not to all, but to those who are ¹⁰ in a sound state of understanding, just as what is absolutely healthy is what is healthy to those in a sound state of body. All such points as this ought to be made very precise, and made use of in the course of discussion as occasion requires.

The demolition of a definition will most surely win a general
 15 approval if the definer happens to have framed his expression
 neither from what is absolutely more intelligible nor yet from
 what is so to us.

One form, then, of the failure to work through more
 intelligible terms is the exhibition of the prior through the
 posterior, as we remarked before.¹ Another form occurs if
 we find² that the definition has been rendered of what is at
 20 rest and definite through what is indefinite and in motion:
 for what is still and definite is prior to what is indefinite
 and in motion.

Of the failure to use terms that are prior there are three
 forms:

(1) The first is when an opposite has been defined through
 its opposite, e. g. good through evil: for opposites are always
 simultaneous by nature. Some people think, also, that both
 25 are objects of the same science, so that the one is not even
 more intelligible than the other. One must, however, observe
 that it is perhaps not possible to define some things in any
 other way, e. g. the double without the half, and all the
 terms that are essentially relative: for in all such cases the
 essential being is the same as a certain relation to some-
 30 thing, so that it is impossible to understand the one term
 without the other, and accordingly in the definition of the
 one the other too must be embraced. One ought to learn
 up all such points as these, and use them as occasion may
 seem to require.

(2) Another is—if he has used the term defined itself.
 This passes unobserved when the actual name of the object
 35 is not used, e. g. supposing any one had defined the sun as
 142^a a 'star that appears by day'.³ For in bringing in 'day' he
 brings in the sun. To detect errors of this sort, exchange
 the word for its definition, e. g. the definition of 'day' as
 the 'passage of the sun over the earth'. Clearly, whoever
 has said 'the passage of the sun over the earth' has said
 5 'the sun', so that in bringing in the 'day' he has brought
 in the sun.

¹ 141^a 26.

² Cf. *Pl. Def.* 411 A.

³ 142^a 20. Read ἡμῖν after δ λόγος.

(3) Again, see if he has defined one co-ordinate member of a division by another, e.g. 'an odd number' as 'that which is greater by one than an even number'. For the co-ordinate members of a division that are derived from the same genus are simultaneous by nature, and 'odd' and 'even' are such terms: for both are differentiae of number. 10

Likewise also, see if he has defined a superior through a subordinate term, e.g. 'An "even number" is "a number divisible into halves"', or '"the good" is a "state of virtue"'. For 'half' is derived from 'two', and 'two' is an even number: virtue also is a kind of good, so that the latter terms are subordinate to the former. Moreover, in 15 using the subordinate term one is bound to use the other as well: for whoever employs the term 'virtue' employs the term 'good', seeing that virtue is a certain kind of good: likewise, also, whoever employs the term 'half' employs the term 'even', for to be 'divided in half' means to be divided into two, and two is even.

- 5 Generally speaking, then, one commonplace rule relates 20 to the failure to frame the expression by means of terms that are prior and more intelligible: and of this the subdivisions are those specified above. A second is, see whether, though the object is in a genus, it has not been placed in a genus. This sort of error is always found where the essence of the object does not stand first in the expression, e.g. the definition of 'body' as 'that which has three dimensions', or the definition of 'man', supposing 25 any one to give it, as 'that which knows how to count': for it is not stated what it is that has three dimensions, or what it is that knows how to count: whereas the genus is meant to indicate just this, and is submitted first of the terms in the definition.

Moreover, see if, while the term to be defined is used in 30 relation to many things, he has failed to render it in relation to all of them; as (e.g.) if he define 'grammar' as the 'knowledge how to write from dictation': for he ought also to say that it is a knowledge how to read as well. For in rendering it as 'knowledge of writing' he has no

more defined it than by rendering it as 'knowledge of reading': neither in fact has succeeded, but only he who mentions both these things, since it is impossible that there
 35 should be more than one definition of the same thing. It is
 143^a only, however, in some cases that what has been said corresponds to the actual state of things: in some it does not, e. g. all those terms which are not used essentially in relation to both things: as medicine is said to deal with the production of disease and health; for it is said essentially to do the latter, but the former only by accident: for it is
 5 absolutely alien to medicine to produce disease. Here, then, the man who renders medicine as relative to both of these things has not defined it any better than he who mentions the one only. In fact he has done it perhaps worse, for any one else besides the doctor is capable of producing disease.

Moreover, in a case where the term to be defined is used
 10 in relation to several things, see if he has rendered it as relative to the worse rather than to the better; for every form of knowledge and potentiality is generally thought to be relative to the best.

Again, if the thing in question be not placed in its own proper genus, one must examine it according to the elementary rules in regard to genera, as has been said before.¹

15 Moreover, see if he uses language which transgresses² the genera of the things he defines, defining, e. g., justice as a 'state that produces equality' or 'distributes what is equal': for by defining it so he passes outside the sphere of virtue, and so by leaving out the genus of justice he fails to express its essence: for the essence of a thing must in each case bring in its genus. It is the same thing if the
 20 object be not put into its nearest genus; for the man who puts it into the nearest one has stated all the higher genera, seeing that all the higher genera are predicated of the lower. Either, then, it ought to be put into its nearest genus, or else to the higher genus all the differentiae ought to be appended whereby the nearest genus is defined. For then he would

¹ 139^b 3.² 143^a 15. Read *ὑπερβαίνων*.

not have left out anything: but would merely have mentioned the subordinate genus by an expression instead of by name. On the other hand, he who mentions merely the higher genus by itself, does not state the subordinate genus as well: in saying 'plant' a man does not specify 'a tree'.

- 6 Again, in regard to the differentiae, we must examine in like manner whether the differentiae, too, that he has stated be those of the genus. For if a man has not defined the object by the differentiae peculiar to it, or has mentioned something such as is utterly incapable of being a differentia of anything, e. g. 'animal' or 'substance', clearly he has not defined it at all: for the aforesaid terms do not differentiate anything at all. Further, we must see whether the differentia stated possesses anything that is co-ordinate with it in a division; for, if not, clearly the one stated could not be a differentia of the genus. For a genus is always divided by differentiae that are co-ordinate members of a division, as, for instance, 'animal' by the terms 'walking', 'flying', 'aquatic', and 'biped'. Or see if, though the contrasted differentia exists, it yet is not true of the genus; for then, clearly, neither of them could be a differentia of the genus; for differentiae that are co-ordinates in a division with the differentia of a thing are all true of the genus to which the thing belongs. Likewise, also, see if, though it be true, yet the addition of it to the genus fails to make a species. For then, clearly, this could not be a specific differentia of the genus: for a specific differentia, if added to the genus, always makes a species. If, however, this be no true differentia, no more is the one adduced, seeing that it is a co-ordinate member of a division with this.

Moreover, see if he divides the genus by a negation, as those do who define a line as 'length without breadth': for this means simply that it has not any breadth. The genus will then be found to partake of its own species: for, since of everything either an affirmation or its negation is true, length must always either lack breadth or possess it,

so that 'length' as well, i.e. the genus of 'line', will be either with or without breadth. But 'length without breadth' is the definition of a species, as also is 'length with breadth': for 'without breadth' and 'with breadth' are differentiae, and the genus and differentia constitute the
 10 definition of the species. Hence the genus would admit of the definition of its species. Likewise, also, it will admit of the definition of the differentia, seeing that one or the other of the aforesaid differentiae is of necessity predicated of the genus. The usefulness of this principle is found in meeting those who assert the existence of 'Ideas': for if
 15 absolute length exist, how will it be predicable of the genus that it has breadth or that it lacks it? For one assertion or the other will have to be true of 'length' universally, if it is to be true of the genus at all: and this is contrary to the fact: for there exist both lengths which have, and lengths which have not, breadth. Hence the only people against whom the rule can be employed are those who
 30 assert that a genus is always¹ numerically one; and this is what is done by those who assert the real existence of the 'Ideas'; for they allege that absolute length and absolute animal are the genus.

It may be that in some cases the definer is obliged to employ a negation as well, e.g. in defining privations. For
 35 'blind' means a thing which cannot see when its nature is to see. There is no difference between dividing the genus by a negation, and dividing it by such an affirmation as is
 144^a bound to have a negation as its co-ordinate in a division, e.g. supposing he had defined something as 'length possessed of breadth'; for co-ordinate in the division with that which is possessed of breadth is that which possesses no breadth and that only, so that again the genus is divided by a negation.

5 Again, see if he rendered the species as a differentia, as do those who define 'contumely' as 'insolence accompanied by jeering'; for jeering is a kind of insolence, i.e. it is a species and not a differentia.

Moreover, see if he has stated the genus as the differentia,

¹ 143^b 30. Read *πῶν γένος*.

e.g. 'Virtue is a good or noble state : for 'good' is the 10
genus of 'virtue'. Or possibly 'good' here is not the
genus but the differentia, on the principle that the same
thing cannot be in two genera of which neither contains
the other: for 'good' does not include 'state', nor vice
versa: for not every state is good nor every good a 'state'.
Both, then, could not be genera, and consequently, if 'state' 15
is the genus of virtue, clearly 'good' cannot be its genus:
it must rather be the differentia. Moreover, 'a state' in-
dicates the essence of virtue, whereas 'good' indicates not
the essence but a quality: and to indicate a quality is
generally held to be the function of the differentia.

See, further, whether the differentia rendered indicates 20
an individual rather than a quality: for the general view is
that the differentia always expresses a quality.

Look and see, further, whether the differentia belongs
only by accident to the object defined. For the differentia
is never an accidental attribute, any more than the genus 25
is: for the differentia of a thing cannot both belong and not
belong to it.

Moreover, if either the differentia or the species, or any
of the things which are under the species, is predicable of
the genus, then he could not have defined the term. For
none of the aforesaid can possibly be predicated of the 30
genus, seeing that the genus is the term with the widest
range of all. Again, see if the genus be predicated of the
differentia; for the general view is that the genus is predi-
cated, not of the differentia, but of the objects of which
the differentia is predicated. Animal (e.g.) is predicated
of 'man' or 'ox' or other walking animals, not of the 35
actual differentia itself which we predicate of the species.
For if 'animal' is to be predicated of each of its differentiae,
then 'animal' would be predicated of the species several
times over; for the differentiae are predicates of the species. 144^b
Moreover, the differentiae will be all either species or indi-
viduals, if they are animals; for every animal is either
a species or an individual.

Likewise you must inquire also if the species or any of
the objects that come under it is predicated of the differen-

tia : for this is impossible, seeing that the differentia is a term with a wider range than the various species. Moreover, if any of the species be predicated of it, the result will be that the differentia is a species: if, for instance, 'man' be predicated, the differentia is clearly the human race. Again, see if the differentia fails to be prior to the
 10 species: for the differentia ought to be posterior to the genus, but prior to the species.

Look and see also if the differentia mentioned belongs to a different genus, neither contained in nor containing the genus in question. For the general view is that the same differentia cannot be used of two non-subaltern genera.
 15 Else the result will be that the same species as well will be in two non-subaltern genera: for each of the differentiae imports its own genus, e.g. 'walking' and 'biped' import with them the genus 'animal'. If, then, each of the genera as well is true of that of which the differentia is true,¹ it clearly follows that the species must be in two
 20 non-subaltern genera. Or perhaps it is not impossible for the same differentia to be used of two non-subaltern genera, and we ought to add the words 'except they both be subordinate members of the same genus'. Thus 'walking animal' and 'flying animal' are non-subaltern genera, and 'biped' is the differentia of both. The words 'except they
 25 both be subordinate members of the same genus' ought therefore to be added; for both these are subordinate to 'animal'. From this possibility, that the same differentia may be used of two non-subaltern genera, it is clear also that there is no necessity for the differentia to carry with it the whole of the genus to which it belongs, but only the one or the other of its limbs together with the genera that are higher than this, as 'biped' carries with it either 'flying'
 30 or 'walking animal'.

See, too, if he has rendered 'existence in' something as the differentia of a thing's essence: for the general view is that locality cannot differentiate between one essence and another. Hence, too, people condemn those who divide animals by means of the terms 'walking' and 'aquatic', on

¹ 144^b 19. Read a comma only, not a full-stop, at ἐκείρερον.

the ground that 'walking' and 'aquatic' indicate mere locality. Or possibly in this case the censure is undeserved; for 'aquatic' does not mean 'in' anything; nor does it 35 denote a locality, but a certain quality: for even if the thing be on the dry land, still it is aquatic: and likewise a land-animal, even though it be in the water, will still be a land- and not an aquatic-animal. But all the same, if 145^a ever the differentia does denote existence in something, clearly he will have made a bad mistake.

Again, see if he has rendered an affection as the differentia: for every affection, if intensified, subverts the essence of the thing, while the differentia is not of that kind: for the differentia is generally considered rather to preserve 5 that which it differentiates; and it is absolutely impossible for a thing to exist without its own special differentia: for if there be no 'walking', there will be no 'man'. In fact, we may lay down absolutely that a thing cannot have as its differentia anything in respect of which it is subject to alteration: for all things of that kind, if intensified, destroy its essence. If, then, a man has rendered 10 any differentia of this kind, he has made a mistake: for we undergo absolutely no alteration in respect of our differentiae.

Again, see if he has failed to render the differentia of a relative term relatively to something else; for the differentiae of relative terms are themselves relative, as in the case also of knowledge. This is classed as speculative, 15 practical, and productive; and each of these denotes a relation: for it speculates upon something, and produces something and does something.

Look and see also if the definer renders each relative term relatively to its natural purpose: for while in some 20 cases the particular relative term can be used in relation to its natural purpose only and to nothing else, some can be used in relation to something else as well. Thus sight can only be used for seeing, but a strigil can also be used to dip up water. Still, if any one were to define a strigil as an instrument for dipping water, he has made a mistake: for that is not its natural function. The definition of a thing's 25

natural function is 'that for which it would be used by the prudent man, acting as such, and by the science that deals specially with that thing'.

Or see if, whenever a term happens to be used in a number of relations, he has failed to introduce it in its primary relation: e. g. by defining 'wisdom' as the virtue
30 of 'man' or of the 'soul', rather than of the 'reasoning faculty': for 'wisdom' is the virtue primarily of the reasoning faculty: for it is in virtue of this that both the man and his soul are said to be wise.

Moreover, if the thing of which the term defined has been stated to be an affection or disposition,¹ or whatever it may be, be unable to admit it, the definer has made a mistake. For every disposition and every affection is
35 formed naturally in that of which it is an affection or disposition, as knowledge, too, is formed in the soul, being a disposition of soul. Sometimes, however, people make bad mistakes in matters of this sort, e. g. all those who say that
145^b 'sleep' is a 'failure of sensation', or that 'perplexity' is a state of 'equality between contrary reasonings', or that 'pain' is a 'violent disruption of parts that are naturally conjoined'. For sleep is not an attribute of sensation, whereas it ought to be, if it is a failure of sensation. Like-
5 wise, perplexity is not an attribute of opposite reasonings, nor pain of parts naturally conjoined: for then inanimate things will be in pain, since pain will be present in them. Similar in character, too, is the definition of 'health', say, as a 'balance of hot and cold elements': for then health will be necessarily exhibited by the hot and cold elements: for a
10 balance of anything is an attribute inherent in those things of which it is the balance, so that health would be an attribute of them. Moreover, people who define in this way put effect for cause, or cause for effect. For the disruption of parts naturally conjoined is not pain, but only a cause of pain: nor again is a failure of sensation sleep, but the one is the
15 cause of the other: for either we go to sleep² because sensation fails, or sensation fails because we go to sleep. Likewise also an equality between contrary reasonings would be

¹ 145^a 34. Read ἡ διάθεσις.

² 145^b 16. Read ὑπνώσσομεν.

generally considered to be a cause of perplexity: for it is when we reflect on both sides of a question and find everything alike to be in keeping with either course that we are perplexed which of the two we are to do. 20

Moreover, with regard to all periods of time look and see whether there be any discrepancy between the differentia and the thing defined: e.g. supposing the 'immortal' to be defined as a 'living thing immune at present from destruction'. For a living thing that is immune 'at present' from destruction will be immortal 'at present'. Possibly, indeed, in this case this result does not follow, owing to the ambiguity of the words 'immune at present from destruction': for it may mean either that the thing has not been destroyed at 25 present, or that it cannot be destroyed at present, or that at present it is such that it never can be destroyed. Whenever, then, we say that a living thing is at present immune from destruction, we mean that it is at present a living thing of such a kind as never to be destroyed: and this is equivalent to saying that it is immortal. so that it is not meant that it is immortal only at present. Still, if ever it 30 does happen that what has been rendered according to the definition belongs in the present only or past, whereas what is meant by the word does not so belong, then the two could not be the same. So, then, this commonplace rule ought to be followed, as we have said.

- 7 You should look and see also whether the term being defined is applied in consideration of something other than the definition rendered. Suppose (e.g.) a definition of 35 'justice' as the 'ability to distribute what is equal'. This would not be right, for 'just' describes rather the man who chooses, than the man who is able, to distribute what is equal: so that justice could not be an ability to distribute 146^a what is equal: for then also the most just man would be the man with the most ability to distribute what is equal.

Moreover, see if the thing admits of degrees, whereas what is rendered according to the definition does not, or, vice versa, what is rendered according to the definition 5 admits of degrees while the thing does not. For either

both must admit them or else neither, if indeed what is rendered according to the definition is the same as the thing. Moreover, see if, while both of them admit of degrees, they yet do not both become greater together: e.g. suppose sexual love to be the desire for intercourse: 10 for he who is more intensely in love has not a more intense desire for intercourse, so that both do not become intensified at once: they certainly should, however, had they been the same thing.

Moreover, suppose two things to be before you, see if the term to be defined applies more particularly to the one to which the content of the definition is less 15 applicable. Take, for instance, the definition of 'fire' as the 'body that consists of the most rarefied particles'. For 'fire' denotes flame rather than light, but flame¹ is less the body that consists of the most rarefied particles than is light: whereas both ought to be more applicable to the same thing, if they had been the same. Again, see if the one expression applies alike to both the objects before you, 20 while the other does not apply to both alike, but more particularly to one of them.

Moreover, see if he renders the definition relative to two things taken separately: thus, 'the beautiful' is 'what is pleasant to the eyes or to the ears'²; or 'the real' is 'what is capable of being acted upon or of acting'. For then the same thing will be both beautiful and not beautiful, and likewise will be both real and not real. For 'pleasant to 25 the ears' will be the same as 'beautiful', so that 'not pleasant to the ears' will be the same as 'not beautiful': for of identical things the opposites, too, are identical, and the opposite of 'beautiful' is 'not beautiful', while of 'pleasant to the ears' the opposite is 'not pleasant to the ears': clearly, then, 'not pleasant to the ears' is the same thing as 'not beautiful'. If, therefore, something be pleasant 30 to the eyes but not to the ears, it will be both beautiful and not beautiful. In like manner we shall show also that the same thing is both real and unreal.

Moreover, of both genera and differentiae and all the

¹ 146^a 17. Read ἡ φλόξ.

² Cf. Pl. *Hipp. Mai.* 297 E, 299 C.

other terms rendered in definitions you should frame definitions in lieu of the terms, and then see if there be any discrepancy between them.

- 8 If the term defined be relative, either in itself or in respect of its genus, see whether the definition fails to mention that to which the term, either in itself or in respect of its genus, is relative, e.g. if he has defined 'knowledge' as an 'incontrovertible conception' or 'wishing' as 'painless conation'. For of everything relative the essence is relative to something else, seeing that the being of every relative term is identical with being in a certain relation to something. He ought, therefore, to have said that knowledge is 'conception of a knowable' and that wishing is 'conation for a good'. Likewise, also, if he has defined 'grammar' as 'knowledge of letters': whereas in the definition there ought to be rendered either the thing to which the term itself is relative, or that, whatever it is, to which its genus is relative. Or see if a relative term has been described not in relation to its end, the end in anything being whatever is best in it or gives its purpose to the rest. Certainly it is what is best or final that should be stated, e.g. that desire is not for the pleasant but for pleasure: for this is our purpose in choosing what is pleasant as well.

Look and see also if that in relation to which he has rendered the term be a process or an activity: for nothing of that kind is an end, for the completion of the activity or process is the end rather than the process or activity itself. Or perhaps this rule is not true in all cases, for almost everybody prefers the present experience of pleasure to its cessation, so that they would count the activity as the end rather than its completion.

Again see in some cases if he has failed to distinguish the quantity or quality or place or other differentiae of an object; e.g. the quality and quantity of the honour the striving for which makes a man ambitious: for all men strive for honour, so that it is not enough to define the ambitious man as him who strives for honour, but the aforesaid differentiae must be added. Likewise, also, in

25 defining the covetous man the quantity of money he aims at, or in the case of the incontinent man the quality of the pleasures, should be stated. For it is not the man who gives way to any sort of pleasure whatever who is called incontinent, but only he who gives way to a certain kind of pleasure. Or again, people sometimes define night as a 'shadow on the earth', or an earthquake as a 'movement of the earth', or a cloud as 'condensation of the air', or a wind as a 'movement of the air'; whereas they ought to
 30 specify as well quantity, quality, place,¹ and cause. Likewise, also, in other cases of the kind: for by omitting any differentiae whatever he fails to state the essence of the term. One should always attack deficiency. For a movement of the earth does not constitute an earthquake, nor a movement of the air a wind, irrespective of its manner
 35 and the amount involved.

Moreover, in the case of conations, and in any other cases where it applies, see if the word 'apparent' is left out,
 147^a e.g. 'wishing is a conation after the good', or 'desire is a conation after the pleasant'—instead of saying 'the apparently good', or 'pleasant'. For often those who exhibit the conation do not perceive what is good or pleasant, so that their aim need not be really good or pleasant, but only apparently so. They ought, there-
 5 fore, to have rendered the definition also accordingly. On the other hand, any one who maintains the existence of Ideas ought to be brought face to face with his Ideas, even though he does render the word in question: for there can be no Idea of anything merely apparent; the general view is that an Idea is always spoken of in relation to an Idea: thus absolute desire is for the absolutely pleasant, and absolute wishing is for the absolutely good; they therefore cannot be for an apparently good or an apparently pleasant:
 10 for the existence of an absolutely-apparently-good or pleasant would be an absurdity.

Moreover, if the definition be of the state of anything, 9 look at what is in the state, while if it be of what is in the

¹ 146^b 30. Read καὶ ποῦ after καὶ πού.

state, look at the state: and likewise also in other cases of the kind. Thus if the pleasant be identical with the beneficial, then, too, the man who is pleased is benefited.¹⁵ Speaking generally, in definitions of this sort it happens that what the definer defines is in a sense more than one thing: for in defining knowledge, a man in a sense defines ignorance as well, and likewise also what has knowledge and what lacks it, and what it is to know and to be ignorant. For if the first be made clear, the others become²⁰ in a certain sense clear as well. We have, then, to be on our guard in all such cases against discrepancy, using the elementary principles drawn from consideration of contraries and of co-ordinates.

Moreover, in the case of relative terms, see if the species is rendered as relative to a species of that to which the genus is rendered as relative, e.g. supposing belief to be relative to some object of belief, see whether a particular²⁵ belief is made relative to some particular object of belief:¹ and, if a multiple be relative to a fraction, see whether a particular multiple be made relative to a particular fraction. For if it be not so rendered, clearly a mistake has been made.

See, also, if the opposite of the term has the opposite definition, whether (e.g.) the definition of 'half' is the opposite of that of 'double': for if 'double' is 'that which exceeds another by an equal amount to that other', 'half' is 'that which is exceeded by an amount equal to itself'. In the same way, too, with contraries. For to the contrary term will apply the definition that is contrary in some one of the ways in which contraries are conjoined. Thus (e.g.) if 'useful' = 'productive of good', 'injurious' = 'productive of evil' or 'destructive of good', for one or the other of³⁵ these is bound to be contrary to the term originally used.^{147^b} Suppose, then, neither of these things to be the contrary of the term originally used, then clearly neither of the definitions rendered later could be the definition of the contrary of the term originally defined: and therefore the definition originally rendered of the original term has not been rightly

¹ 147^a 25. Read πρὸς τὸ ὑποληπτόν.

rendered either. Seeing, moreover, that of contraries, the
 5 one is sometimes a word formed to denote the privation of
 the other, as (e.g.) inequality is generally held to be the
 privation of equality (for 'unequal' merely describes things
 that are not 'equal'), it is therefore clear that ¹ that contrary
 whose form denotes the privation must of necessity be
 defined through the other; whereas the other cannot then
 be defined through the one whose form denotes the priva-
 tion; for else we should find that each is being interpreted
 10 by the other. We must in the case of contrary terms keep
 an eye on this mistake, e.g. supposing any one were to
 define equality as the contrary of inequality: for then he
 is defining it through the term which denotes privation
 of it. Moreover, a man who so defines is bound to use in
 his definition the very term he is defining; and this becomes
 clear, if for the word we substitute its definition. For to say
 15 'inequality' is the same as to say 'privation of equality'.
 Therefore equality so defined will be 'the contrary of the
 privation of equality', so that he would have used the very
 word to be defined. Suppose, however, that neither of the
 contraries be so formed as to denote privation, but yet the
 definition of it be rendered in a manner like the above,
 e.g. suppose 'good' to be defined as 'the contrary of evil',
 then, since it is clear that 'evil' too ² will be 'the contrary
 of good' (for the definition of things that are contrary in
 20 this way must be rendered in a like manner),³ the result
 again is that he uses the very term being defined: for
 'good' is inherent in the definition of 'evil'. If, then, 'good'
 be the contrary of evil, and evil be nothing other than the
 'contrary of good', then 'good' will be the 'contrary of
 the contrary of good'. Clearly, then, he has used the very
 25 word to be defined.

Moreover, see if in rendering a term formed to denote
 privation, he has failed to render the term of which it is the
 privation, e.g. the state, or contrary, or whatever it may be

¹ 147^b 6. Read *δῆλον οὖν ὅτι*.

² 147^b 19. Read *δῆλον γὰρ ὅτι καὶ κακόν*.

³ 147^b 20. For *ἀποδοτέος*, ὥστε read *ἀποδοτέος ἐστί*. The sentence
τῶν γὰρ οὕτως . . . ἀποδοτέος ἐστί is parenthetical, and may be enclosed in
 brackets.

whose privation it is: also if he has omitted to add either any term at all in which the privation is naturally formed, or else that in which it is naturally formed primarily, e.g. whether in defining 'ignorance' as a privation he has ³⁰ failed to say that it is the privation of 'knowledge'; or has failed to add in what it is naturally formed, or, though he has added this, has failed to render the thing in which it is primarily formed, placing it (e.g.) in 'man' or in 'the soul', and not in the 'reasoning faculty': for if in any of these respects he fails, he has made a mistake. Likewise, also, if he has failed to say that 'blindness' is the 'privation of sight in an eye': for a proper rendering of its essence must state ³⁵ both of what it is the privation and what it is that is deprived. 148^a

Examine further whether he has defined by the expression 'a privation' a term that is not used to denote a privation: thus a mistake of this sort also would be generally thought to be incurred in the case of 'error' by ⁵ any one who is not using it as a merely negative term. For what is generally thought to be in error is not that which has no knowledge, but rather that which has been deceived, and for this reason we do not talk of inanimate things or of children as 'erring'. 'Error', then, is not used to denote a mere privation of knowledge.

- 10 Moreover, see whether the like inflexions in the definition apply to the like ¹ inflexions of the term, e.g. if 'beneficial' ¹⁰ means 'productive of health', does 'beneficially' mean 'productively of health' and a 'benefactor' a 'producer of health'?

Look too and see whether the definition given will apply to the Idea as well. For in some cases it will not do so; e.g. in the Platonic definition where he adds the word ¹⁵ 'mortal' in his definitions of living creatures: for the Idea (e.g. the absolute Man) is not mortal, so that the definition will not fit the Idea. So always wherever the words 'capable of acting on' or 'capable of being acted upon' are added, the definition and the Idea are absolutely bound to be discrepant: for those who assert the existence of Ideas ²⁰

¹ 148^a 10. Read *ei eti twn dynamew.*

hold that they are incapable of being acted upon, or of motion. In dealing with these people even arguments of this kind are useful.

Further, see if he has rendered a single common definition of terms that are used ambiguously. For terms whose definition corresponding to their common name is one and the
 25 same, are *synonymous*; if, then, the definition applies in a like manner to the whole range of the *ambiguous* term, it is not true of any one of the objects described by the term. This is, moreover, what happens to Dionysius' definition of 'life' when stated as 'a movement of a creature sustained by nutriment, congenitally present with it': for this is found
 30 in plants as much as in animals, whereas 'life' is generally understood to mean not one kind of thing only, but to be one thing in animals and another in plants. It is possible to hold the view that life is a synonymous term and is always used to describe one thing only, and therefore to render the definition in this way on purpose: or it may quite well happen that a man may see the ambiguous character of the word, and wish to render the definition of
 35 the one sense only, and yet fail to see that he has rendered a definition common to both senses instead of one peculiar to the sense he intends. In either case, whichever course he pursues, he is equally at fault. Since ambiguous terms sometimes pass unobserved, it is best in questioning to treat
 148^b such terms as though they were synonymous (for the definition of the one sense will not apply to the other, so that the answerer will be generally thought not to have defined it correctly, for to a synonymous term the definition should apply in its full range), whereas in answering you should yourself distinguish between the senses. Further, as some
 5 answerers call 'ambiguous' what is really synonymous, whenever the definition rendered fails to apply universally, and, vice versa, call synonymous what is really ambiguous supposing their definition applies to both senses of the term, one should secure a preliminary admission on such points, or else prove beforehand that so-and-so is ambiguous or synonymous, as the case may be: for people are more ready to agree when they do not foresee what the consequence

will be. If, however, no admission has been made, and the 10 man asserts that what is really synonymous is ambiguous because the definition he has rendered will not apply to the second sense as well, see if the definition of this second meaning applies also to the other meanings: for if so, this meaning must clearly be synonymous with those others. Otherwise, there will be more than one definition of those 15 other meanings, for there are applicable to them two distinct definitions in explanation of the term, viz. the one previously rendered and also the later one. Again, if any one were to define a term used in several senses, and, finding that his definition does not apply to them all, were to contend not that the term is ambiguous, but that even the term does not properly apply to all those senses, just because his definition will not do so either, then one may retort to such a man that though in some things one must not use the language 20 of the people, yet in a question of terminology one is bound to employ the received and traditional usage and not to upset matters of that sort.

- II Suppose now that a definition has been rendered of some complex term, take away the definition of one of the elements in the complex, and see if also the rest of the 25 definition defines the rest of it: if not, it is clear that neither does the whole definition define the whole complex. Suppose, e. g., that some one has defined a 'finite straight line' as 'the limit of a finite plane, such that its centre is in a line with its extremes'; if now the definition of a 'finite line' be the 'limit of a finite plane', the rest (viz. 'such that its centre 30 is in a line with its extremes') ought to be a definition of 'straight'. But an infinite straight line has neither centre nor extremes and yet is straight, so that this remainder does not define the remainder of the term.

Moreover, if the term defined be a compound notion, see if the definition rendered be equimembral with the term defined. A definition is said to be equimembral with the term defined when the number of the elements compounded 35 in the latter is the same as the number of nouns and verbs in the definition. For the exchange in such cases is bound

to be merely one of term for term,¹ in the case of some if
 149^a not of all, seeing that there are no more terms used now
 than formerly; whereas in a definition terms ought to be
 rendered by phrases, if possible in every case, or if not, in
 the majority. For at that rate, simple objects too could
 be defined by merely calling them by a different name,
 e. g. 'cloak' instead of 'doublet'.

5 The mistake is even worse, if actually a less well known
 term be substituted, e. g. 'pellucid mortal' for 'white man'.
 for it is no definition, and moreover is less intelligible when
 put in that form.

Look and see also whether, in the exchange of words,
 the sense fails still to be the same. Take, for instance,
 the explanation of 'speculative knowledge' as 'speculative
 10 conception.' for conception is not the same as knowledge
 —as it certainly ought to be if the whole is to be the
 same too for though the word 'speculative' is common to
 both expressions, yet the remainder is different.

Moreover, see if in replacing one of the terms by something
 15 else he has exchanged the genus and not the differentia, as
 in the example just given for 'speculative' is a less familiar
 term than knowledge; for the one is the genus and the other
 the differentia, and the genus is always the most familiar term
 of all; so that it is not this, but the differentia, that ought
 to have been changed, seeing that it is the less familiar.
 20 It might be held that this criticism is ridiculous because
 there is no reason why the most familiar term should not
 describe the differentia, and not the genus; in which case,
 clearly, the term to be altered would also be that denoting
 the genus and not the differentia. If, however, a man is
 substituting for a term not merely another term but a
 25 phrase, clearly it is of the differentia rather than of the
 genus that a definition should be rendered, seeing that
 the object of rendering the definition is to make the subject
 familiar; for the differentia is less familiar than the genus.

² If he has rendered the definition of the differentia, see

¹ 148^b 36. Read αὐτῶν τῶν ὀνομάτων.

² 149^a 29. Bekker follows the older editions in marking this as the
 beginning of ch. 12.

whether the definition rendered is common to it and some- 30
 thing else as well: c.g. whenever he says that an odd
 number is a 'number with a middle', further definition is
 required of how it has a middle: for the word 'number
 is common to both expressions, and it is the word 'odd'
 for which the phrase has been substituted. Now both a line
 and a body have a middle, yet they are not 'odd'; so that
 this could not be a definition of 'odd'. If, on the other 35
 hand, the phrase 'with a middle' be used in several senses,
 the sense here intended requires to be defined. So that
 this will either discredit the definition or prove that it is no
 definition at all.

- 12 Again, see if the term of which he renders the definition
 is a reality, whereas what is contained in the definition is
 not. c.g. Suppose 'white' to be defined as 'colour mingled 149^b
 with fire': for what is bodiless cannot be mingled with body,
 so that 'colour' 'mingled with fire' could not exist, whereas
 'white' does exist.

Moreover, those who in the case of relative terms do
 not distinguish to what the object is related, but have
 described it only so as to include it among too large a 5
 number of things, are wrong either wholly or in part; e.g.
 suppose some one to have defined 'medicine' as a 'science
 of Reality'. For if medicine be not a science of any-
 thing that is real, the definition is clearly altogether false;
 while if it be a science of some real thing, but not of an-
 other, it is partly false; for it ought to hold of all reality;
 if it is said to be of Reality essentially and not accidentally;
 as is the case with other relative terms: for every object of 10
 knowledge is a term relative to knowledge: likewise, also,
 with other relative terms, inasmuch as all such are con-
 vertible. Moreover, if the right way to render account of
 a thing be to render it as it is not in itself but accidentally,
 then each and every relative term would be used in relation 15
 not to one thing but to a number of things. For there is
 no reason why the same thing should not be both real and
 white and good, so that it would be a correct rendering to
 render the object in relation to any one whatsoever of these,

if to render what it is accidentally be a correct way to render it. It is, moreover, impossible that a definition of this sort should be peculiar to the term rendered: for not
 20 only medicine, but the majority of the other sciences too, have for their object some real thing, so that each will be a science of reality. Clearly, then, such a definition does not define any science at all; for a definition ought to be peculiar to its own term, not general.

Sometimes, again, people define not the thing but only
 25 the thing in a good or perfect condition. Such is the definition of a rhetorician as 'one who can always see what will persuade in the given circumstances, and omit nothing'; or of a thief, as 'one who pilfers in secret': for clearly, if they each do this, then the one will be a good rhetorician, and the other a good thief: whereas it is not the actual pilfering
 30 in secret, but the wish to do it, that constitutes the thief.

Again, see if he has rendered what is desirable for its own sake as desirable for what it produces or does, or as in any way desirable because of something else, e. g. by saying that justice is 'what preserves the laws' or that wisdom is 'what produces happiness'; for what produces or preserves something else is one of the things desirable for something else.
 35 It might be said that it is possible for what is desirable in itself to be desirable for something else as well: but still to define what is desirable in itself in such a way is none the less wrong: for the essence contains *par excellence* what is best in anything, and it is better for a thing to be desirable in itself than to be desirable for something else, so that this is rather what the definition too ought to have indicated.

150^a See also whether in defining anything a man has defined 12
 it as an 'A and B', or as a 'product of A and B' or as an 'A + B'. If he defines it as 'A and B', the definition will be true of both and yet of neither of them; suppose, e. g., justice to be defined as 'temperance and courage'. For
 5 if of two persons each has one of the two only, both and yet neither will be just: for both together have justice, and yet each singly fails to have it. Even if the situation here described does not so far appear very absurd because of the

occurrence of this kind of thing in other cases also (for it is quite possible for two men to have a mina between them, though neither of them has it by himself), yet at least that they should have contrary attributes surely seems quite ¹⁰ absurd; and yet this will follow if the one be temperate and yet a coward, and the other, though brave, be a profligate; for then both will exhibit both justice and injustice: for if justice be temperance and bravery, then injustice will be cowardice and profligacy. In general, too, all the ways ¹⁵ of showing that the whole is not the same as the sum of its parts are useful in meeting the type just described; for a man who defines in this way seems to assert that the parts are the same as the whole. The arguments are particularly appropriate in cases where the process of putting the parts together is obvious, as in a house and other things of that sort: for there, clearly, you may have the parts and ²⁰ yet not have the whole, so that parts and whole cannot be the same.

If, however, he has said that the term being defined is not 'A and B' but the 'product of A and B', look and see in the first place if A and B cannot in the nature of things have a single product: for some things are so related to one another that nothing can come of them, e.g. a line and ²⁵ a number. Moreover, see if the term that has been defined is in the nature of things found primarily in some single subject, whereas the things which he has said produce it are not found primarily in any single subject, but each in a separate one. If so, clearly that term could not be the product of these things: for the whole is bound to be in the same things wherein its parts are, so that the whole will then be found primarily not in one subject only, but in a ³⁰ number of them. If, on the other hand, both parts and whole are found primarily in some single subject, see if that medium is not the same, but one thing in the case of the whole and another in that of the parts. Again, see whether the parts perish together with the whole: for it ought to happen, vice versa, that the whole perishes when the parts perish; when the whole perishes, there is no necessity that ³⁵ the parts should perish too. Or again, see if the whole be

good or evil, and the parts neither, or, vice versa, if the parts be good or evil and the whole neither. For it is impossible either for a neutral thing to produce something
 150^b good or bad, or for things good or bad to produce a neutral thing. Or again, see if the one thing is more distinctly good than the other is evil, and yet the product be no more good than evil, e.g. suppose shamelessness be defined as 'the product of courage and false opinion': here the good-
 5 ness of courage exceeds the evil of false opinion; accordingly the product of these ought to have corresponded to this excess, and to be either good without qualification, or at least more good than evil. Or it may be that this does not necessarily follow, unless each be in itself good or bad; for many things that are productive are not good in themselves, but only in combination; or, *per contra*, they are good taken
 10 singly, and bad or neutral in combination. What has just been said is most clearly illustrated in the case of things that make for health or sickness; for some drugs are such that each taken alone is good, but if they are both administered in a mixture, bad.

Again, see whether the whole, as produced from a better
 15 and worse, fails to be worse than the better and better than the worse element. This again, however, need not necessarily be the case, unless the elements compounded be in themselves good; if they are not, the whole may very well not be good, as in the cases just instanced.

Moreover, see if the whole be synonymous with one of the elements: for it ought not to be, any more than in the
 20 case of syllables: for the syllable is not synonymous with any of the letters of which it is made up.

Moreover, see if he has failed to state the manner of their composition: for the mere mention of its elements is not enough to make the thing intelligible. For the essence of any compound thing is not merely that it is a product of so-and-so, but that it is a product of them compounded in
 25 such and such a way, just as in the case of a house: for here the materials do not make a house irrespective of the way they are put together.

If a man has defined an object as 'A + B', the first thing

to be said is that 'A + B' means the same either as 'A and B', or as the 'product of A and B'. For 'honey + water' means either the honey and the water, or the 'drink made of honey and water'. If, then, he admits that 'A + B' is the same as 30 either of these two things, the same criticisms will apply as have already been given for meeting each of them. Moreover, distinguish between the different senses in which one thing may be said to be '+' another, and see if there is none of them in which A could be said to exist '+' B'. Thus e.g. supposing the expression to mean that they exist either in 35 some identical thing capable of containing them (as e.g. justice and courage are found in the soul), or else in the same place or in the same time, and if this be in no way true of the A and B in question, clearly the definition rendered could not hold of anything, as there is no possible way in which A can exist '+' B'. If, however, among the 151^a various senses above distinguished, it be true that A and B are each found in the same time as the other, look and see if possibly the two are not used in the same relation. Thus e.g. suppose courage to have been defined as 'daring with right reasoning': here it is possible that the person exhibits daring in robbery, and right reasoning in regard to the 5 means of health: but he may have 'the former quality + the latter' at the same time, and not as yet be courageous! Moreover, even though both be used in the same relation as well, e.g. in relation to medical treatment (for a man may exhibit both daring and right reasoning in respect of medical treatment), still, none the less, not even this combination of 'the one + the other' makes him 'courageous'. For the two must not relate to any casual object that is the same, any 10 more than each to a different object; rather, they must relate to the function of courage, e.g. meeting the perils of war, or whatever is more properly speaking its function than this.

Some definitions rendered in this form fail to come under the aforesaid division at all, e.g. a definition of anger as 15 'pain with a consciousness of being slighted'. For what this means to say is that it is because of a consciousness of this sort that the pain occurs; but to occur 'because of'

a thing is not the same as to occur ' + a thing ' in any of its aforesaid senses.

20 Again, if he have described the whole compounded as 14
the ' composition ' of these things (e. g. ' a living creature ' as
a ' composition of soul and body '), first of all see whether he
has omitted to state the kind of composition, as (e. g.) in
a definition of ' flesh ' or ' bone ' as the ' composition of fire,
earth, and air '. For it is not enough to say it is a com-
position, but you should also go on to define the kind of
25 composition : for these things do not form flesh irrespective
of the manner of their composition, but when compounded
in one way they form flesh, when in another, bone. It
appears, moreover, that neither of the aforesaid substances
is the same as a ' composition ' at all : for a composition
always has a decomposition as its contrary, whereas neither
of the aforesaid has any contrary. Moreover, if it is equally
probable that every compound is a composition or else that
30 none is, and every kind of living creature, though a com-
pound, is never a composition, then no other compound
could be a composition either.

Again, if in the nature of a thing two contraries are
equally liable to occur, and the thing has been defined
through the one, clearly it has not been defined ; else there
will be more than one definition of the same thing ; for how
35 is it any more a definition to define it through this one than
through the other, seeing that both alike are naturally liable
151^b to occur in it ? Such is the definition of the soul, if defined
as a substance capable of receiving knowledge : for it has
a like capacity for receiving ignorance.

Also, even when one cannot attack the definition as a
whole for lack of acquaintance with the whole, one should
5 attack some part of it, if one knows that part and sees it to
be incorrectly rendered : for if the part be demolished, so
too is the whole definition. Where, again, a definition is
obscure, one should first of all correct and reshape it in
order to make some part of it clear and get a handle for
attack, and then proceed to examine it. For the answerer
10 is bound either to accept the sense as taken by the questioner,

or else himself to explain clearly whatever it is that his definition means. Moreover, just as in the assemblies the ordinary practice is to move an emendation of the existing law and, if the emendation is better, they repeal the existing law, so one ought to do in the case of definitions as well: one ought oneself to propose a second definition: for if it is 15 seen to be better, and more indicative of the object defined, clearly the definition already laid down will have been demolished, on the principle that there cannot be more than one definition of the same thing.

In combating definitions it is always one of the chief elementary principles to take by oneself a happy shot at a definition of the object before one, or to adopt some correctly expressed definition. For one is bound, with the 20 model (as it were) before one's eyes, to discern both any shortcoming in any features that the definition ought to have, and also any superfluous addition, so that one is better supplied with lines of attack.

As to definitions, then, let so much suffice.

BOOK VII

- 151^b WHETHER two things are 'the same' or 'different', in the most literal of the meanings ascribed to 'sameness' (and we said¹ that 'the same' applies in the most literal sense to what is numerically one), may be examined in the light of their inflexions and coordinates and opposites. For if justice be the same as courage, then too the just man is the same as the brave man, and 'justly' is the same as 'bravely'. Likewise, too, in the case of their opposites: for if two things be the same, their opposites also will be the same, in any of the recognized forms of opposition. For it is the same thing to take the opposite of the one or that of the other, seeing that they are the same. Again it may be examined in the light of those things which tend to produce or to destroy the things in question, of their formation and destruction, and in general of any thing that is related in like manner to each. For where things are absolutely the same, their formations and destructions also are the same, and so are the things that tend to produce or to destroy them.
- 5 Look and see also, in a case where one of two things is said to be something or other in a superlative degree, if the other of these alleged identical things can also be described by a superlative in the same respect. Thus Xenocrates argues that the happy life and the good life are the same, seeing that of all forms of life the good life is the most desirable and so also is the happy life: for 'the most desirable' and 'the greatest' apply but to one thing.²
- 10 Likewise also in other cases of the kind. Each, however, of the two things termed 'greatest' or 'most desirable' must be numerically one: otherwise no proof will have been given that they are the same; for it does not follow because Peloponnesians and Spartans are the bravest of the

¹ 103^a 23.

² Fr. 82 Heinze.

Greeks, that Peloponnesians are the same as Spartans, seeing that 'Peloponnesian' is not any one person nor yet 15 'Spartan'; it only follows that the one must be included under the other as 'Spartans' are under 'Peloponnesians': for otherwise, if the one class be not included under the other, each will be better than the other. For then the Peloponnesians are bound to be better than the Spartans, 20 seeing that the one class is not included under the other; for they are better than anybody else. Likewise also the Spartans must perforce be better than the Peloponnesians; for they too are better than anybody else; each then is better than the other! Clearly therefore what is styled 'best' 25 and 'greatest' must be a single thing, if it is to be proved to be 'the same' as another. This also is why Xenocrates fails to prove his case: for the happy life is not numerically single, nor yet the good life, so that it does not follow that, because they are both the most desirable, they are therefore the same, but only that the one falls under the other. 30

Again, look and see if, supposing the one to be the same as something, the other also is the same as it: for if they be not both the same as the same thing, clearly neither are they the same as one another.

Moreover, examine them in the light of their accidents or of the things of which they are accidents: for any accident belonging to the one must belong also to the other, and if the 35 one belong to anything as an accident, so must the other also. If in any of these respects there is a discrepancy, clearly they are not the same.

See further whether, instead of both being found in one class of predicates, the one signifies a quality and the other a quantity or relation. Again, see if the genus of each be not the same, the one being 'good' and the other 'evil', 152^b or the one being 'virtue' and the other 'knowledge': or see if, though the genus is the same, the differentiae predicted of either be not the same, the one (e.g.) being distinguished as a 'speculative' science, the other as a 'practical' science. Likewise also in other cases. 5

Moreover, from the point of view of 'degrees', see if the one admits an increase of degree but not the other,

or if though both admit it, they do not admit it at the same time; just as it is not the case that a man desires intercourse more intensely, the more intensely he is in love, so that love and the desire for intercourse are not the same.

- 10 Moreover, examine them by means of an addition, and see whether the addition of each to the same thing fails to make the same whole; or if the subtraction of the same thing from each leaves a different remainder. Suppose (e.g.) that he has declared 'double a half' to be the same as 'a multiple of a half': then, subtracting the words 'a half' from each, the remainders ought to have signified
15 the same thing: but they do not; for 'double' and 'a multiple of' do not signify the same thing.

Inquire also not only if some impossible consequence results directly from the statement made, that A and B are the same, but also whether it is possible for a supposition to bring it about; as happens to those who assert that
20 'empty' is the same as 'full of air': for clearly if the air be exhausted, the vessel will not be less but more empty, though it will no longer be full of air. So that by a supposition, which may be true or may be false (it makes no difference which), the one character is annulled and not the other, showing that they are not the same.

- 25 Speaking generally, one ought to be on the look-out for any discrepancy anywhere in any sort of predicate of each term, and in the things of which they are predicated. For all that is predicated of the one should be predicated also of the other, and of whatever the one is a predicate, the other should be a predicate of it as well.

- 30 Moreover, as 'sameness' is a term used in many senses, see whether things that are the same in one way are the same also in a different way. For there is either no necessity or even no possibility that things that are the same specifically or generically should be numerically the same, and it is with the question whether they are or are not the same in that sense that we are concerned.

Moreover, see whether the one can exist without the
35 other; for, if so, they could not be the same.

2 Such is the number of the commonplace rules that relate to 'sameness'. It is clear from what has been said that all the destructive commonplaces relating to sameness are useful also in questions of definition, as was said before:¹ for if what is signified by the term and by the expression be not the same, clearly the expression rendered could not 153^a be a definition. None of the constructive commonplaces, on the other hand, helps in the matter of definition; for it is not enough to show the sameness of content between the expression and the term, in order to establish that the former is a definition, but a definition must have also all the other characters already announced.² 5

3 This then is the way, and these the arguments, whereby the attempt to demolish a definition should always be made. If, on the other hand, we desire to establish one, the first thing to observe is that few if any who engage in discussion arrive at a definition by reasoning: they always assume something of the kind as their starting point,—both in 10 geometry and in arithmetic and the other studies of that kind. In the second place, to say accurately what a definition is, and how it should be given, belongs to another inquiry.³ At present it concerns us only so far as is required for our present purpose, and accordingly we need only make the bare statement that to reason to a thing's definition and essence is quite possible. For if a definition 15 is an expression signifying the essence of the thing and the predicates contained therein ought also to be the only ones which are predicated of the thing in the category of essence; and genera and differentiae are so predicated in that category: it is obvious that if one were to get an admission that so and so are the only⁴ attributes predicated in that category, the expression containing so and so would of 20 necessity be a definition; for it is impossible that anything else should be a definition, seeing that there is not anything else predicated of the thing in the category of essence.

That a definition may thus be reached by a process of

¹ 102^a 11.

² *An. Post.* ii. 3-13.

³ 139^a 27-35.

⁴ 153^a 19. Read *μόνα*.

reasoning is obvious. The means whereby it should be established have been more precisely defined elsewhere,¹
 25 but for the purposes of the inquiry now before us the same commonplace rules serve. For we have to examine into the contraries and other opposites of the thing, surveying the expressions used both as wholes and in detail: for if the opposite definition defines that opposite term, the definition given must of necessity be that of the term before us.
 30 Seeing, however, that contraries may be conjoined in more than one way, we have to select from those contraries the one whose contrary definition seems most obvious. The expressions, then, have to be examined each as a whole in the way we have said, and also in detail as follows. First of all, see that the genus rendered is correctly rendered; for if the contrary thing be found in the contrary genus to that stated in the definition, and the thing before you is
 35 not in that same genus, then it would clearly be in the contrary genus: for contraries must of necessity be either in the same genus or in contrary genera. The differentiae, too, that are predicated of contraries we expect to be contrary, e.g. those of white and black, for the one tends to
 153^b pierce the vision, while the other tends to compress it. So that if contrary differentiae to those in the definition are predicated of the contrary term, then those rendered in the definition would be predicated of the term before us. Seeing, then, that both the genus and the differentiae have been rightly rendered, clearly the expression given must be the right definition. It might be replied that there is no necessity
 5 why contrary differentiae should be predicated of contraries, unless the contraries be found within the same genus: of things whose genera are themselves contraries it may very well be that the same differentia is used of both, e.g. of justice and injustice; for the one is a virtue and the other a vice of the soul: 'of the soul'; therefore, is the
 10 differentia in both cases, seeing that the body as well has its virtue and vice. But this much at least is true, that the differentiae of contraries are either contrary or else the same. If, then, the contrary differentia to that given be predicated

¹ *An. Post.* ii. 13.

of the contrary term and not of the one in hand, clearly the differentia stated must be predicated of the latter. Speaking generally, seeing that the definition consists of genus and differentiae, if the definition of the contrary term be 15 apparent, the definition of the term before you will be apparent also: for since its contrary is found either in the same genus or in the contrary genus, and likewise also the differentiae predicated of opposites are either contrary to, or the same as, each other, clearly of the term before you there will be predicated either the same genus as of its 20 contrary, while, of its differentiae, either all are contrary to those of its contrary, or at least some of them are so while the rest remain the same; or, vice versa, the differentiae will be the same and the genera contrary; or both genera and differentiae will be contrary. And that is all; for that both should be the same is not possible; else contraries will have the same definition.

Moreover, look at it from the point of view of its inflexions 25 and coordinates. For genera and definitions are bound to correspond in either case. Thus if forgetfulness be the loss of knowledge, to forget is to lose knowledge, and to have forgotten is to have lost knowledge. If, then, any one whatever of these is agreed to, the others must of necessity be 30 agreed to as well. Likewise, also, if destruction is the decomposition of the thing's essence, then to be destroyed is to have its essence decomposed, and 'destructively' means 'in such a way as to decompose its essence'; if again 'destructive' means 'apt to decompose something's essence', then also 'destruction' means 'the decomposition of its essence'. Likewise also with the rest: get an admission of any one 35 of them whatever, and all the rest are admitted too.

Moreover, look at it from the point of view of things that stand in relations that are like each other. For if 'healthy' means 'productive of health', 'vigorous' too will mean 'productive of vigour', and 'useful' will mean 'productive of good'. For each of these things is related in like manner to its own peculiar end, so that if one of them 154^a is defined as 'productive of' that end, this will also be the definition of each of the rest as well.

Moreover, look at it from the point of view of greater and like degrees, in all the ways in which it is possible to establish a result by comparing two and two together. Thus if A defines α better than B defines β , and B is a definition of β , so too is A of α . Further, if A's claim to define α is like B's to define β , and B defines β , then A too defines α . This examination from the point of view of greater degrees is of no use when a single definition is compared with two things, or two definitions with one thing; for there cannot possibly be one definition of two things or two of the same thing.

The most handy of all the commonplace arguments are those just mentioned and those from coordinates and inflexions, and these therefore are those which it is most important to master and to have ready to hand: for they are the most useful on the greatest number of occasions. Of the rest, too, the most important are those of most general application: for these are the most effective, e.g. that you should examine the individual cases,¹ and then look to see in the case of their various species whether the definition applies. For the species is synonymous with its individuals. This sort of inquiry is of service against those who assume the existence of Ideas, as has been said before.² Moreover see if a man has used a term metaphorically, or predicated it of itself as though it were something different. So too if any other of the commonplace rules is of general application and effective, it should be employed.

That it is more difficult to establish than to overthrow a definition, is obvious from considerations presently to be urged. For to see for oneself, and to secure from those whom one is questioning, an admission of premisses of this sort is no simple matter, e.g. that of the elements of the definition rendered the one is genus and the other differentia, and that only the genus and differentiae are predicated in the category of essence. Yet without these premisses it is impossible to reason to a definition; for if any other

¹ 154^a 17. Read τὰ καθ' ἑκάστα.

² 148^a 14

things as well are predicated of the thing in the category of essence, there is no telling whether the formula stated or some other one is its definition, for a definition is an expression indicating the essence of a thing. The point is clear also from the following: It is easier to draw one conclusion than many. Now in demolishing a definition it is sufficient to argue against one point only¹ (for if we have overthrown any single point whatsoever, we shall have demolished the definition); whereas in establishing a definition, one is bound to bring people to the view that everything contained in the definition is attributable. Moreover, in establishing a case, the reasoning brought forward must be universal: for the definition put forward must be predicated of everything of which the term is predicated, and^{154^b} must moreover be convertible, if the definition rendered is to be peculiar to the subject. In overthrowing a view, on the other hand, there is no longer any necessity to show one's point universally: for it is enough to show that the formula is untrue of any one of the things embraced under the term. Further, even supposing it should be necessary to overthrow something by a universal proposition, not even so is there any need to prove the converse of the proposition in the process of overthrowing the definition. For merely to show that the definition fails to be predicated of every one of the things of which² the term is predicated, is enough to overthrow it universally: and there is no need to prove the converse of this in order to show that³ the term is predicated of things of which the expression is not predicated. Moreover, even if it applies to everything embraced under the term, but not to it alone, the definition is thereby demolished.

The case stands likewise in regard to the property and genus of a term also. For in both cases it is easier to overthrow than to establish. As regards the property this¹⁵ is clear from what has been said: for as a rule the property is rendered in a complex phrase, so that to overthrow it, it is only necessary to demolish one of the terms used, whereas

¹ 154^a 34. Read πρὸς ἓν.

² 154^b 7. Read κατὰ πάντων ὅσων.

³ 154^b 9. Delete comma after δείξει.

to establish it it is necessary to reason to them all. Then, too, nearly all the other rules that apply to the definition will apply also to the property of a thing. For in establishing a property one has to show that it is true of every-
 20 thing included under the term in question, whereas to overthrow one it is enough to show in a single case only that it fails to belong: further, even if it belongs to every-
 thing falling under the term, but not to that only, it is overthrown in this case as well, as was explained in the case of the definition.¹ In regard to the genus, it is clear that you are bound to establish it in one way only, viz. by showing
 25 that it belongs in every case, while of overthrowing it there are two ways: for if it has been shown that it belongs either never or not in a certain case, the original statement has been demolished. Moreover, in establishing a genus it is not enough to show that it belongs, but also that it belongs as genus has to be shown; whereas in overthrowing it, it is enough to show its failure to belong either in some particular
 30 case or ² in every case. It appears, in fact, as though, just as in other things to destroy is easier than to create, so in these matters too to overthrow is easier than to establish.

In the case of an accidental attribute the universal proposition is easier to overthrow than to establish; for to
 35 establish it, one has to show that it belongs in every case, whereas to overthrow it, it is enough to show that it does not belong in one single case. The particular proposition is, on the contrary, easier to establish than to overthrow: for to establish it, it is enough to show that it belongs in
 155^a a particular instance, whereas to overthrow it, it has to be shown that it never belongs at all.

It is clear also that the easiest thing of all is to overthrow a definition. For on account of the number of statements involved we are presented in the definition with the greatest number of points for attack, and the more plentiful the
 5 material, the quicker an argument comes: for there is more likelihood of a mistake occurring in a large than in a small number of things. Moreover, the other rules too may be used as means for attacking a definition: for if either the

¹ l. 10.² 154^b 29. Delete $\mu\eta$ at end of line.

formula be not peculiar, or the genus rendered be the wrong one, or something included in the formula fail to belong, the definition is thereby demolished. On the other hand, against the others we cannot bring all of the arguments drawn from definitions, nor yet of the rest: for only those relating to accidental attributes apply generally to all the aforesaid kinds of attribute. For while each of the aforesaid kinds of attribute must belong to the thing in question, yet the genus may very well not belong as a property without as yet being thereby demolished. Likewise also the property need not belong as a genus, nor the accident as a genus or property, so long as they do belong. So that it is impossible to use one set as a basis of attack upon the other except in the case of definition. Clearly, then, it is the easiest of all things to demolish a definition, while to establish one is the hardest. For there one both has to establish all those other points by reasoning (i. e. that the attributes stated belong, and that the genus rendered is the true genus, and that the formula is peculiar to the term), and moreover, besides this, that the formula indicates the essence of the thing; and this has to be done correctly.

Of the rest, the property is most nearly of this kind: for it is easier to demolish, because as a rule it contains several terms; while it is the hardest to establish, both because of the number of things that people must be brought to accept, and, besides this, because it belongs to its subject alone and is predicated convertibly with its subject.

The easiest thing of all to establish is an accidental predicate: for in other cases one has to show not only that the predicate belongs, but also that it belongs in such and such a particular way: whereas in the case of the accident it is enough to show merely that it belongs. On the other hand, an accidental predicate is the hardest thing to overthrow, because it affords the least material: for in stating an accident a man does not add how the predicate belongs; and accordingly, while in other cases it is possible to demolish what is said in two ways, by showing either that the predicate does not belong, or that it does not belong in the particular way stated, in the case of an accidental predi-

cate the only way to demolish it is to show that it does not belong at all.

The commonplace arguments through which we shall be well supplied with lines of argument with regard to our several problems have now been enumerated at about sufficient length.

BOOK VIII

I NEXT there fall to be discussed the problems of arrangement and method in putting questions. Any one who intends to frame questions must, first of all, select the ground from which he should make his attack; secondly, ⁵ he must frame them and arrange them one by one to himself; thirdly and lastly, he must proceed actually to put them to the other party. Now so far as the selection of his ground is concerned the problem is one alike for the philosopher and the dialectician; but how to go on to arrange his points and frame his questions concerns the dialectician only: for in every problem of that kind a reference to ¹⁰ another party is involved. Not so with the philosopher, and the man who is investigating by himself: the premisses of his reasoning, although true and familiar, may be refused by the answerer because they lie too near the original statement and so he foresees what will follow if he grants them: but for this the philosopher does not care. Nay, he may possibly be even anxious to secure axioms as familiar and ¹⁵ as near to the question in hand as possible: for these are the bases on which scientific reasonings are built up.

The sources from which one's commonplace arguments should be drawn have already been described:¹ we have now to discuss the arrangement and formation of questions and first to distinguish the premisses, other than the necessary premisses, which have to be adopted. By necessary premisses are meant those through which the actual reasoning ²⁰ is constructed. Those which are secured other than these are of four kinds; they serve either inductively to secure the universal premiss being granted, or to lend weight to the argument, or to conceal the conclusion, or to render the argument more clear. Beside these there is no other premiss which need be secured: these are the ones whereby you ²⁵

¹ *Top.* ii-vii.

should try to multiply and formulate your questions. Those which are used to conceal the conclusion serve a controversial purpose only; but inasmuch as an undertaking of this sort is always conducted against another person, we are obliged to employ them as well.

The necessary premisses through which the reasoning is effected, ought not to be propounded directly in so many words.¹ Rather one should soar as far aloof from them as possible. Thus if one desires to secure an admission that the knowledge of contraries is one, one should ask him to admit it not of contraries, but of opposites: for, if he grants this, one will then argue that the knowledge of contraries is also the same, seeing that contraries are opposites; if he does not, one should secure the admission by induction, by formulating a proposition to that effect in the case of some particular pair of contraries. For one must secure the necessary premisses either by reasoning or by induction, or else partly by one and partly by the other, although any propositions which are too obvious to be denied may be formulated in so many words. This is because the coming
156^a conclusion is less easily discerned at the greater distance and in the process of induction, while at the same time, even if one cannot reach the required premisses in this way, it is still open to one to formulate them in so many words. The premisses, other than these, that were mentioned above,² must be secured with a view to the latter. The way to employ them respectively is as follows: Induction should
5 proceed from individual cases to the universal and from the known to the unknown; and the objects of perception are better known, to most people if not invariably. Concealment of one's plan is obtained by securing through prosyllogisms the premisses through which the proof of the original proposition is going to be constructed—and as many of them as possible. This is likely to be effected by making syllogisms to prove not only the necessary
10 premisses but also some of those which are required to establish them. Moreover, do not state the conclusions of

¹ 155^b 30. Read εὐθὺς αὐτὰς προταθείον, with A, B, and Waitz.

² 155^b 20-28.

these premisses but draw them later one after another ; for this is likely to keep the answerer at the greatest possible distance from the original proposition. Speaking generally, a man who desires to get information by a concealed method should so put his questions that when he has put his whole argument and has stated the conclusion, people still ask 15 ' Well, but why is that ? ' This result will be secured best of all by the method above described : for if one states only the final conclusion, it is unclear how it comes about ; for the answerer does not foresee on what grounds it is based, because the previous syllogisms have not been made articulate to him : while the final syllogism, showing the con- 20 clusion, is likely to be kept least articulate if we lay down not the secured propositions on which it is based, but only the grounds on which we reason to them.

It is a useful rule, too, not to secure the admissions claimed as the bases of the syllogisms in their proper order, but alternately those that conduce to one conclusion and those that conduce to another ; for, if those which go together 25 are set side by side, the conclusion that will result from them is more obvious in advance.

One should also, wherever possible, secure the universal premiss by a definition relating not to the precise terms themselves but to their co-ordinates ; for people deceive themselves, whenever the definition is taken in regard to a co-ordinate, into thinking that they are not making the 30 admission universally. An instance would be, supposing one had to secure the admission that the angry man desires vengeance on account of an apparent slight, and were to secure this, that ' anger ' is a desire for vengeance on account of an apparent slight : for, clearly, if this were secured, we should have universally what we intend. If, on the other hand, people formulate propositions relating to the actual terms themselves, they often find that the answerer refuses 35 to grant them because on the actual term itself he is readier with his objection, e. g. that the ' angry man ' does not desire vengeance, because we become angry with our parents, but we do not desire vengeance on them. Very likely the objection is not valid ; for upon some people it is vengeance

156^b enough to cause them pain and make them sorry ; but still it gives a certain plausibility and air of reasonableness to the denial of the proposition. In the case, however, of the definition of 'anger' it is not so easy to find an objection.

Moreover, formulate your proposition as though you did so not for its own sake, but in order to get at something else : for people are shy of granting what an opponent's case really requires. Speaking generally, a questioner should leave it as far as possible doubtful whether he wishes to secure an admission of his proposition or of its opposite : for if it be uncertain what their opponent's argument requires, people are more ready to say what they themselves think.

10 Moreover, try to secure admissions by means of likeness : for such admissions are plausible, and the universal involved is less patent ; e.g. make the other person admit that as knowledge and ignorance of contraries is the same, so too perception of contraries is the same ; or vice versa, that since the perception is the same, so is the knowledge also. This argument resembles induction, but is not the same thing ;
15 for in induction it is the universal whose admission is secured from the particulars, whereas in arguments from likeness, what is secured is not the universal under which all the like cases fall.

It is a good rule also, occasionally to bring an objection against oneself : for answerers are put off their guard against
20 those who appear to be arguing impartially. It is useful too, to add that 'So and so is generally-held or commonly said' ; for people are shy of upsetting the received opinion unless they have some positive objection to urge : and at the same time they are cautious about upsetting such things because they themselves too find them useful. Moreover, do not be insistent, even though you really require the point :
25 for insistence always arouses the more opposition. Further, formulate your premiss as though it were a mere illustration : for people admit the more readily a proposition made to serve some other purpose, and not required on its own account. Moreover, do not formulate the very proposition you need to secure, but rather something from which that necessarily follows : for people are more willing to admit

the latter, because it is not so clear from this what the result will be, and if the one has been secured, the other has been secured also. Again, one should put last the point which one most wishes to have conceded; for people are specially inclined to deny the first questions put to them, because most people in asking questions put first the points which they are most eager to secure. On the other hand, in dealing with some people propositions of this sort should be put forward first: for ill-tempered men admit most readily what comes first, unless the conclusion that will result actually stares them in the face, while at the close of an argument they show their ill-temper. Likewise also with those who consider themselves smart at answering: for when they have admitted most of what you want they finally talk clap-trap to the effect that the conclusion does not follow from their admissions: yet they say 'Yes' readily, confident in their own character, and imagining that they cannot suffer any reverse. Moreover, it is well to expand the argument and insert things that it does not require at all, as do those who draw false geometrical figures: for in the multitude of details the whereabouts of the fallacy is obscured. For this reason also a questioner sometimes evades observation as he adds in a corner what, if he formulated it by itself, would not be granted.

For concealment, then, the rules which should be followed are the above. Ornament is attained by induction and distinction of things closely akin. What sort of process induction is is obvious: as for distinction, an instance of the kind of thing meant is the distinction of one form of knowledge as better than another by being either more accurate, or concerned with better objects; or the distinction of sciences into speculative, practical, and productive. For everything of this kind lends additional ornament to the argument, though there is no necessity to say them, so far as the conclusion goes.

For clearness, examples and comparisons should be adduced, and let the illustrations be relevant and drawn from things that we know, as in Homer and not as in Choerilus; for then the proposition is likely to become clearer.

In dialectics, syllogism should be employed in reasoning ²
²⁰ against dialecticians rather than against the crowd: induction,
 on the other hand, is most useful against the crowd. This
 point ¹ has been treated previously as well.² In induction,
 it is possible in some cases to ask the question in its universal
 form, but in others this is not easy, because there is no
 established general term that covers all the resemblances:
 in this case, when people need to secure the universal, they
 use the phrase 'in all cases of this sort'. But it is one of
²⁵ the very hardest things to distinguish which of the things
 adduced are 'of this sort', and which are not: and in this
 connexion people often throw dust in each others' eyes in
 their discussion, the one party asserting the likeness of things
 that are not alike, and the other disputing the likeness of
 things that are. One ought, therefore, to try oneself to coin
³⁰ a word to cover all things of the given sort, so as to leave
 no opportunity either to the answerer to dispute, and say
 that the thing advanced does not answer to a like description,
 or to the questioner to suggest falsely that it does answer to
 a like description, for many things appear to answer to like
 descriptions that do not really do so.

If one has made an induction on the strength of several
 cases and yet the answerer refuses to grant the universal
³⁵ proposition, then it is fair to demand his objection. But
 until one has oneself stated in what cases it is so, it is not
 fair to demand that he shall say in what cases it is not so:
 for one should make the induction first, and then demand
 the objection. One ought, moreover, to claim that the
 objections should not be brought in reference to the actual
 subject of the proposition, unless that subject happen to be
 the one and only thing of the kind, as for instance two is
^{157^b} the one prime number among the even numbers: for,
 unless he can say that this subject is unique of its kind, the
 objector ought to make his objection in regard to some
 other. People sometimes object to a universal proposition,
 and bring their objection not in regard to the thing itself,
 but in regard to some homonym of it: thus they argue
⁵ that a man can very well have a colour or a foot or a hand

¹ 157^a 21. Read *ἐπὶ τοῦτον*, with B, C, and Waitz.

² 105^a 16.

other than his own, for a painter may have a colour that is not his own, and a cook may have a foot that is not his own. To meet them, therefore, you should draw the distinction before putting your question in such cases: for so long as the ambiguity remains undetected, so long will the objection to the proposition be deemed valid. If, however, he checks the series of questions by an objection in regard not to some homonym, but to the actual thing asserted, the questioner should withdraw the point objected to, and form the remainder into a universal proposition, until he secures what he requires; e.g. in the case of forgetfulness and having forgotten: for people refuse to admit that the man who has lost his knowledge of a thing has forgotten it, because if the thing alters, he has lost knowledge of it, but he has not forgotten it. Accordingly the thing to do is to withdraw the part objected to, and assert the remainder, 15 e.g. that if a person have lost knowledge of a thing while it still remains, he then has forgotten it. One should similarly treat those who object to the statement that 'the greater the good, the greater the evil that is its opposite'. for they allege that health, which is a less good thing than vigour, has a greater evil as its opposite: for disease is a greater evil than debility. In this case too, therefore, we 20 have to withdraw the point objected to; for when it has been withdrawn, the man is more likely to admit the proposition, e.g. that 'the greater good has the greater evil as its opposite, unless the one good involves the other as well', as vigour involves health. This should be done not only when he formulates an objection, but also if, without so doing, he refuses to admit the point because 25 he foresees something of the kind: for if the point objected to be withdrawn, he will be forced to admit the proposition because he cannot foresee in the rest of it any case where it does not hold true: if he refuse to admit it, then when asked for an objection he certainly will be unable to render one. Propositions that are partly false and partly true are of this type: for in the case of these it 30 is possible by withdrawing a part to leave the rest true. If, however, you formulate the proposition on the strength

of many cases and he has no objection to bring, you may claim that he shall admit it: for a premiss is valid in dialectics which thus holds in several instances and to which no objection is forthcoming.

Whenever it is possible to reason to the same conclusion
 35 either through or without a *reductio per impossibile*, if one is demonstrating and not arguing dialectically it makes no difference which method of reasoning be adopted, but in argument with another reasoning *per impossibile* should be avoided. For where one has reasoned without the *reductio per impossibile*, no dispute can arise; if, on the other hand,
 158^a one does reason to an impossible conclusion, unless its falsehood is too plainly manifest, people deny that it is impossible, so that the questioners do not get what they want.

One should put forward all propositions that hold true of several cases, and to which either no objection whatever appears or at least not any on the surface: for when people
 5 cannot see any case in which it is not so, they admit it for true.

The conclusion should not be put in the form of a question; if it be, and the man shakes his head, it looks as if the reasoning had failed. For often, even if it be not put as a question but advanced as a consequence, people deny
 10 it, and then those who do not see that it follows¹ upon the previous admissions do not realize that those who deny it have been refuted: when, then, the one man merely asks it as a question without even saying that it so follows, and the other denies it, it looks altogether as if the reasoning had failed.

Not every universal question can form a dialectical proposition as ordinarily understood, e.g. 'What is man?' or 'How many meanings has "the good"?' For a dialectical premiss must be of a form to which it is possible to reply 'Yes' or 'No', whereas to the aforesaid it is not possible. For this reason questions of this kind are not dialectical unless the questioner himself draws distinctions or divisions before expressing them, e.g. 'Good means this, or this,

¹ 158^a 11. Read *ὅτι συμβαίνει* with Waitz.

does it not?' For questions of this sort are easily answered 20 by a Yes or a No. Hence one should endeavour to formulate propositions of this kind in this form. It is at the same time also perhaps fair to ask the other man how many meanings of 'the good' there are, whenever you have yourself distinguished and formulated them, and he will not admit them at all.

Any one who keeps on asking one thing for a long time 25 is a bad inquirer. For if he does so though the person questioned keeps on answering the questions, clearly he asks a large number of questions, or else asks the same question a large number of times: in the one case he merely babbles, in the other he fails to reason: for reasoning always consists of a small number of premisses. If, on the other hand, he does it because the person questioned does not answer the questions, he is at fault in not taking him to task or breaking off the discussion. 30

3 There are certain hypotheses upon which it is at once difficult to bring, and easy to stand up to, an argument. Such (e.g.) are those things which stand first and those which stand last in the order of nature. For the former require definition, while the latter have to be arrived at through many steps if one wishes to secure a continuous proof from first principles, or else all discussion about them 35 wears the air of mere sophistry: for to prove anything is impossible unless one begins with the appropriate principles, and connects inference with inference till the last are reached. Now to define first principles is just what answerers do not care to do, nor do they pay any attention if the questioner makes a definition: and yet until it is clear what it is that is proposed, it is not easy to discuss it. This sort of thing 158^b happens particularly in the case of the first principles: for while the other propositions are shown through these, these cannot be shown through anything else: we are obliged to understand every item of that sort by a definition.

The inferences, too, that lie too close to the first principle 5 are hard to treat in argument: for it is not possible to bring many arguments in regard to them, because of the small

number of those steps, between the conclusion and the principle, whereby the succeeding propositions have to be shown. The hardest, however, of all definitions to treat in argument are those that employ terms about which, in the
 10 first place, it is uncertain whether they are used in one sense or several, and, further, whether they are used literally or metaphorically by the definer. For because of their obscurity, it is impossible to argue upon such terms; and because of the impossibility of saying whether this obscurity is due to their being used metaphorically, it is impossible
 15 to refute them.

In general, it is safe to suppose that, whenever any problem proves intractable, it either needs definition or else bears either several senses, or a metaphorical sense, or it is not far removed from the first principles; or else the reason is that we have yet to discover in the first place just this—
 20 in which of the aforesaid directions the source of our difficulty lies: when we have made this clear, then obviously our business must be either to define or to distinguish, or to supply the intermediate premisses: for it is through these that the final conclusions are shown.

It often happens that a difficulty is found in discussing
 25 or arguing a given position because the definition has not been correctly rendered: e. g. 'Has one thing one contrary or many?': here when the term 'contraries' has been properly defined, it is easy to bring people to see whether it is possible for the same thing to have several contraries or not: in the same way also with other terms requiring definition. It appears also in mathematics that the difficulty
 30 in using a figure is sometimes due to a defect in definition; e. g. in proving that the line which cuts the plane parallel to one side¹ divides similarly both the line which it cuts and the area; whereas if the definition be given, the fact asserted becomes immediately clear: for the areas have the same fraction subtracted from them as have the sides:
 35 and this is the definition of 'the same ratio'. The most primary of the elementary principles are without exception very easy to show, if the definitions involved,

¹ Sc. of a parallelogram.

e. g. the nature of a line or of a circle, be laid down; only the arguments that can be brought in regard to each of them are not many, because there are not many intermediate steps. If, on the other hand, the definition of the starting-points be not laid down, to show them is difficult and may even prove quite impossible. The case of the significance 159^a of verbal expressions is like that of these mathematical conceptions.

One may be sure then, whenever a position is hard to discuss, that one or other of the aforesaid things has happened to it. Whenever, on the other hand, it is a harder task to argue to the point claimed, i. e. the premiss, 5 than to the resulting position, a doubt may arise whether such claims should be admitted or not: for if a man is going to refuse to admit it and claim that you shall argue to it as well, he will be giving the signal for a harder undertaking than was originally proposed: if, on the other hand, he grants it, he will be giving the original thesis credence on the strength of what is less credible than itself. If, then, it is essential not to enhance the difficulty of the problem, he had better grant it; if, on the other 10 hand, it be essential to reason through premisses that are better assured, he had better refuse. In other words, in serious inquiry he ought not to grant it, unless he be more sure about it than about the conclusion; whereas in a dialectical exercise he may do so if he is merely satisfied of its truth. Clearly, then, the circumstances under which such admissions should be claimed are different for a mere questioner and for a serious teacher.

- 4 As to the formulation, then, and arrangement of one's 15 questions, about enough has been said.

With regard to the giving of answers, we must first define what is the business of a good answerer, as of a good questioner. The business of the questioner is so to develop the argument as to make the answerer utter the most extravagant paradoxes that necessarily follow because of 20 his position: while that of the answerer is to make it appear that it is not he who is responsible for the absurdity

or paradox, but only his position: for one may, perhaps, distinguish between the mistake of taking up a wrong position to start with, and that of not maintaining it properly, when once taken up.

25 Inasmuch as no rules are laid down for those who argue 5
for the sake of training and of examination :—and the aim
of those engaged in teaching or learning is quite different
from that of those engaged in a competition ; as is the
latter from that of those who discuss things together in
the spirit of inquiry : for a learner should always state what
he thinks: for no one is even trying to teach him what is
30 false ; whereas in a competition the business of the questioner
is to appear by all means to produce an effect upon the other,
while that of the answerer is to appear unaffected by him ;
on the other hand, in an assembly of disputants discussing
in the spirit not of a competition but of an examination
and inquiry, there are as yet no articulate rules about what
35 the answerer should aim at, and what kind of things he
should and should not grant for the correct or incorrect
defence of his position :¹—inasmuch, then, as we have no
tradition bequeathed to us by others, let us try to say
something upon the matter for ourselves.

The thesis laid down by the answerer before facing the
questioner's argument is bound of necessity to be one
that is either generally accepted or generally rejected
or else is neither : and moreover is so accepted or re-
159^bjected either absolutely or else with a restriction, e.g. by
some given person, by the speaker or by some one else.
The manner, however, of its acceptance or rejection, what-
ever it be, makes no difference : for the right way to answer,
i.e. to admit or to refuse to admit what has been asked,
will be the same in either case. If, then, the statement laid
down by the answerer be generally rejected, the conclusion
5 aimed at by the questioner is bound to be one generally
accepted, whereas if the former be generally accepted,
the latter is generally rejected : for the conclusion which

¹ 159^a 26–36. Put οὐ γὰρ . . . τὴν θέσιν in brackets, followed by a colon.

the questioner tries to draw is always the opposite of the statement laid down. If, on the other hand, what is laid down is generally neither rejected nor accepted, the conclusion will be of the same type as well. Now since a man who reasons correctly demonstrates his proposed conclusion from premisses that are more generally accepted, and more familiar, it is clear that (1) where the view laid down by him is one that generally is absolutely rejected, the answerer 10 ought not to grant either what is thus absolutely not accepted at all, or what is accepted indeed, but accepted less generally than the questioner's conclusion. For if the statement laid down by the answerer be generally rejected, the conclusion aimed at by the questioner will be one that is generally accepted, so that the premisses secured by the questioner should all be views generally accepted, and more generally accepted than his proposed conclusion, if the less 15 familiar is to be inferred through the more familiar. Consequently, if any of the questions put to him be not of this character, the answerer should not grant them. (2) If, on the other hand, the statement laid down by the answerer be generally accepted without qualification, clearly the conclusion sought by the questioner will be one generally rejected without qualification. Accordingly, the answerer should admit all views that are generally accepted and, of those that are not generally accepted, all that are less generally rejected than the conclusion sought by the questioner. For then he will probably be thought to have argued sufficiently well. (3) Likewise, too, if the statement laid down by the answerer 20 be neither rejected generally nor generally accepted; for then, too, anything that appears to be true should be granted, and, of the views not generally accepted, any that are more generally accepted than the questioner's conclusion; for in that case the result will be that the arguments will be more generally accepted. If, then, the view laid down by the answerer be one that is generally accepted or rejected without qualification, then the views that are accepted absolutely must be taken as the standard of comparison: 25 whereas if the view laid down be one that is not generally accepted or rejected, but only by the answerer, then the

standard whereby the latter must judge what is generally accepted or not, and must grant or refuse to grant the point asked, is himself.¹ If, again, the answerer be defending some one else's opinion, then clearly it will be the latter's judgment to which he must have regard in granting or denying the various points. This is why those, too, who introduce
 30 other's opinions, e. g. that 'good and evil are the same thing', as Heraclitus says,² refuse to admit the impossibility of contraries belonging at the same time to the same thing; not because they do not themselves³ believe this, but because on Heraclitus' principles one has to say so. The same thing is done also by those who take on the defence of
 35 one another's positions; their aim being to speak as would the man who stated the position.

It is clear, then, what the aims of the answerer should be, 6 whether the position he lays down be a view generally accepted without qualification or accepted by some definite person. Now every question asked is bound to involve some view that is either generally held or generally rejected or neither, and is also bound to be either relevant to the argument or irrelevant: if then it be a view generally
 160^a accepted and irrelevant, the answerer should grant it and remark that it is the accepted view: if it be a view not generally accepted and irrelevant, he should grant it but add a comment that it is not generally accepted, in order to avoid the appearance of being a simpleton. If it be relevant and also be generally accepted, he should admit that it is the view generally accepted but say that it lies too
 5 close to the original proposition, and that if it be granted the problem proposed collapses. If what is claimed by the questioner be relevant but too generally rejected, the answerer, while admitting that if it be granted the conclusion sought follows, should yet protest that the proposition is too absurd to be admitted. Suppose, again, it be a view that is neither rejected generally nor generally accepted, then, if it be irrelevant to the argument, it may be granted
 10 without restriction; if, however, it be relevant, the answerer

¹ 159^b 27. Read *αἰρόν*. ² *Fr.* 58, 102 Diels. ³ 159^b 32. Read *αἰροίς*.

should add the comment that, if it be granted, the original problem collapses. For then the answerer will not be held to be personally accountable for what happens to him, if he grants the several points with his eyes open, and also the questioner will be able to draw his inference, seeing that all the premisses that are more generally accepted than the conclusion are granted him. Those who try to draw an inference from premisses more generally rejected than the 15 conclusion clearly do not reason correctly: hence, when men ask these things, they ought not to be granted.

- 7 The questioner should be met in a like manner also in the case of terms used obscurely, i.e. in several senses. For the answerer, if he does not understand, is always permitted to say 'I do not understand': he is not compelled to reply 'Yes' or 'No' to a question which may mean 20 different things. Clearly, then, in the first place, if what is said be not clear, he ought not to hesitate to say that he does not understand it; for often people encounter some difficulty from assenting to questions that are not clearly put. If he understands the question and yet it covers many senses, then supposing what it says to be universally true or false, 25 he should give it an unqualified assent or denial: if, on the other hand, it be partly true and partly false, he should add a comment that it bears different senses, and also that in one it is true, in the other false: for if he leave this distinction till later, it becomes uncertain whether originally as well he perceived the ambiguity or not. If he does not foresee the ambiguity, but assents to the question having in view the one sense of the words, then, 30 if the questioner takes it in the other sense, he should say, 'That was not what I had in view when I admitted it; I meant the other sense': for if a term or expression covers more than one thing, it is easy to disagree. If, however, the question is both clear and simple, he should answer either 'Yes' or 'No'.

- 8 A premiss in reasoning always either is one of the con- 35 stituent elements in the reasoning, or else goes to establish

one of these : (¹and you can always tell when it is secured in order to establish something else by the fact of a number of similar questions being put : for as a rule people secure their universal by means either of induction or of likeness) :—
 accordingly the particular propositions should all be admitted, if they are true and generally held. On the other hand, against the universal one should try to bring some negative instance ; for to bring the argument to a standstill without a negative instance, either real or apparent, shows ill-temper. If, then, a man refuses to grant the universal when supported² by many instances, although he has no negative instance to show, he obviously shows ill-temper.
 5 If, moreover, he cannot even attempt a counter-proof that it is not true, far more likely is he to be thought ill-tempered—although even counter-proof is not enough : for we often hear arguments that are contrary to common opinions, whose solution is yet difficult, e. g. the argument of Zeno³ that it is impossible to move or to traverse the stadium ;—but still, this is no reason for omitting to assert the opposites of these
 10 views. If, then, a man refuses to admit the proposition without having either a negative instance or some counter-argument to bring against it, clearly he is ill-tempered : for ill-temper in argument consists in answering in ways other than the above, so as to wreck the reasoning.

Before maintaining either a thesis or a definition the answerer should try his hand at attacking it by himself ;
 15 for clearly his business is to oppose those positions from which questioners demolish what he has laid down.

He should beware of maintaining a hypothesis that is generally rejected : and this it may be in two ways : for it may be one which results in absurd statements, e. g. suppose any one were to say that everything is in motion or that nothing is ; and also there are all those which only a bad
 20 character would choose, and which are implicitly opposed to men's wishes, e. g. that pleasure is the good, and that to do

¹ 160^a 36–7. Begin parenthesis at δῆλον . . . , and substitute colon for bracket after ἐρωτῶν.

² 160^b 3. Read φαινόμενον.

³ 160^b 8. Read καθάπερ τὸν Ζήνωνος. Cf. *Phys.* 233^a 21–31, 239^b 9–14.

injustice is better than to suffer it. For people then hate him, supposing him to maintain them not for the sake of argument but because he really thinks them.

- 10 Of all arguments that reason to a false conclusion the right solution is to demolish the point on which the fallacy that occurs depends: for the demolition of any random point¹ is no solution, even though the point demolished be²⁵ false. For the argument may contain many falsehoods, e.g. suppose some one to secure the premisses, 'He who sits, writes' and 'Socrates is sitting': for from these it follows that 'Socrates is writing'. Now we may demolish the proposition 'Socrates is sitting', and still be no nearer a solution of the argument; it may be true that the point claimed is false; but it is not on that that the fallacy of the³⁰ argument depends: for supposing that any one should happen to be sitting and not writing, it would be impossible in such a case to apply the same solution. Accordingly, it is not this that needs to be demolished, but rather that 'He who sits, writes': for he who sits does not always write. He, then, who has demolished the point on which the fallacy depends, has given the solution of the argument completely. Any one who knows that it is on such and such a point that the argument depends, knows the solution³⁵ of it, just as in the case of a figure falsely drawn. For it is not enough to object, even if the point demolished be a falsehood, but the reason of the fallacy should also be proved: for then it would be clear whether the man makes his objection with his eyes open or not.

There are four possible ways of preventing a man from^{161^a} working his argument to a conclusion. It can be done either by demolishing the point on which the falsehood that comes about depends, or by stating an objection directed against the questioner: for often when a solution has not as a matter of fact been brought, yet the questioner is rendered thereby unable to pursue the argument any farther. Thirdly, one may object to the questions asked: for it may happen that⁵ what the questioner wants does not follow from the ques-

¹ 160^b 24. Read \acute{o} before $\delta\tau\iota\omicron\upsilon\lambda\upsilon$.

tions he has asked because he has asked them badly, whereas if something additional be granted the conclusion comes about. If, then, the questioner be unable to pursue his argument farther, the objection¹ would properly be directed against the questioner; if he can do so, then it would be against his questions. The fourth and worst kind of objection is that which is directed to the time allowed for discussion: for some people bring objections of a kind which would take longer to answer than the length of the discussion in hand.

There are then, as we said, four ways of making objections: but of them the first alone is a solution: the others
15 are just hindrances and stumbling-blocks to prevent the conclusions.

Adverse criticism of an argument on its own merits, and
of it when presented in the form of questions, are two different things. For often the failure to carry through the argument correctly in discussion is due to the person questioned, because he will not grant the steps of which a correct argument might have been made against his position: for it
20 is not in the power of the one side only to effect properly a result that depends on both alike. Accordingly it sometimes becomes necessary to attack the speaker and not his position, when the answerer lies in wait for the points that are contrary to the questioner and becomes abusive as well: when people lose their tempers in this way, their argument becomes a contest, not a discussion. Moreover, since argu-
25 ments of this kind are held not for the sake of instruction but for purposes of practice and examination, clearly one has to reason not only to true conclusions, but also to false ones, and not always through true premisses, but sometimes through false as well. For often, when a true proposition is put forward, the dialectician is compelled to demolish it: and then false propositions have to be formulated. Some-
30 times also when a false proposition is put forward, it has to be demolished by means of false propositions: for it is possible for a given man to believe what is not the fact

¹ 161^a 9. Read ἡ ἐνστάσις

more firmly than the truth. Accordingly, if the argument be made to depend on something that he holds, it will be easier to persuade or help him. He, however, who would rightly convert any one to a different opinion should do so in a dialectical and not in a contentious manner, just as a geometrician should reason geometrically, whether his conclusion be false or true: what kind of syllogisms are dialectical has already been said.¹ The principle that a man who hinders the common business is a bad partner, clearly applies to an argument as well; for in arguments as well there is a common aim in view, except with mere contestants, for these cannot both reach the same goal; for more than one cannot possibly win. It makes no difference whether he effects this as answerer or as questioner: for both he who asks contentious questions is a bad dialectician, and also he who in answering fails to grant the obvious answer or to understand the point of the questioner's inquiry. What has been said, then, makes it clear that adverse criticism is not to be passed in a like strain upon the argument on its own merits, and upon the questioner: for it may very well be that the argument is bad, but that the questioner has argued with the answerer in the best possible way: for when men lose their tempers, it may perhaps be impossible to make one's inferences straightforwardly as one would wish: we have to do as we can. 10

Inasmuch as it is indeterminate when people are claiming the admission of contrary things, and when they are claiming what originally they set out to prove—for often when they are talking by themselves they say contrary things, and admit afterwards what they have previously denied; for which reason they often assent, when questioned, to contrary things and to what originally had to be proved—the argument is sure to become vitiated. The responsibility, however, for this rests with the answerer, because while refusing to grant other points, he does grant points of that kind. It is, then, clear that adverse criticism is not to be passed in a like manner upon questioners and upon their arguments.

¹ 100^a 22.

In itself an argument is liable to five kinds of adverse criticism:

30 (1) The first is when neither the proposed conclusion nor indeed any conclusion at all is drawn from the questions asked, and when most, if not all, of the premisses on which the conclusion rests are false or generally rejected, when, moreover, neither any withdrawals nor additions nor both together can bring the conclusions about.

25 (2) The second is, supposing the reasoning, though constructed from the premisses, and in the manner, described above, were to be irrelevant to the original position.

(3) The third is, supposing certain additions would bring an inference about but yet these additions were to be weaker than those that were put as questions, and less generally held than the conclusion.

(4) Again, supposing certain withdrawals could effect the
30 same: for sometimes people secure more premisses than are necessary, so that it is not through them that the inference comes about.

(5) Moreover, suppose the premisses be less generally held and less credible than the conclusion, or if, though true, they require more trouble to prove than the proposed view.

One must not claim that the reasoning to a proposed view
35 shall in every case equally be a view generally accepted and convincing: for it is a direct result of the nature of things that some subjects of inquiry shall be easier and some harder, so that if a man brings people to accept his point from opinions that are as generally received as the case admits, he has argued his case correctly. Clearly, then, not even the argument itself is open to the same adverse criticism when taken in relation to the proposed conclusion and when taken by itself. For there is nothing to prevent
40 the argument being open to reproach in itself, and yet commendable in relation to the proposed conclusion, or again,
162^a vice versa, being commendable in itself, and yet open to reproach in relation to the proposed conclusion, whenever there are many propositions both generally held and also true whereby it could easily be proved. It is possible also that an argument, even though brought to a conclusion,

may sometimes be worse than one which is not so con-₅cluded, whenever the premisses of the former are silly, while its conclusion is not so; whereas the latter, though requiring certain additions, requires only such as are generally held and true, and moreover does not rest as an argument on these additions. With those which bring about a true conclusion by means of false premisses, it is not fair to find fault: for a false conclusion must of necessity always be reached from a false premiss, but a true conclusion ₁₀ may sometimes be drawn even from false premisses; as is clear from the *Analytics*.¹

Whenever by the argument stated something is demonstrated, but that something is other than what is wanted and has no bearing whatever on the conclusion, then no inference as to the latter² can be drawn from it: and if there appears to be, it will be a sophism, not a proof. A philosopheme ₁₅ is a demonstrative inference: an epichireme is a dialectical inference: a sophism is a contentious inference: an aporeme is an inference that reasons dialectically to a contradiction.

If something were to be shown from premisses, both of which are views generally accepted, but not accepted with ₂₀ like conviction, it may very well be that the conclusion shown is something held more strongly than either. If, on the other hand, general opinion be for the one and neither for nor against the other, or if it be for the one and against the other, then, if the pro and con be alike in the case of the premisses, they will be alike for the conclusion also: if, on the other hand, the one preponderates, the conclusion too will follow suit.

It is also a fault in reasoning when a man shows something through a long chain of steps, when he might employ ₂₅ fewer steps and those already included in his argument: suppose him to be showing (c. g.) that one opinion is more properly so called than another, and suppose him to make his postulates as follows: 'x-in-itself is more fully x than anything else': 'there genuinely exists an object of opinion in itself': therefore 'the object-of-opinion-in-itself is more fully an object of opinion than the particular objects of opinion'. Now 'a relative term is more fully itself when

¹ *An. Pr.* ii. 2.

² 162^a 14. Read *περί ἐκείνου*.

its correlate is more fully itself': and 'there exists a genuine
 30 opinion-in-itself, which will be "opinion" in a more accurate
 sense than the particular opinions': and it has been postu-
 lated both that 'a genuine opinion-in-itself exists', and that
 'x-in-itself is more fully x than anything else': therefore
 'this will be opinion in a more accurate¹ sense'. Wherein
 lies the viciousness of the reasoning? Simply in that it
 conceals the ground on which the argument depends.

35 An argument is clear in one, and that the most ordinary, 12
 sense, if it be so brought to a conclusion as to make no
 further questions necessary: in another sense, and this is
 the type most usually advanced, when the propositions
 162^b secured are such as compel the conclusion, and the argument
 is concluded² through premisses that are themselves con-
 clusions: moreover, it is so also if some step is omitted
 that generally is firmly accepted.

An argument is called fallacious in four senses: (1) when
 it appears to be brought to a conclusion, and is not really
 5 so—what is called 'contentious' reasoning: (2) when it
 comes to a conclusion but not to the conclusion proposed—
 which happens principally in the case of *reductiones ad
 impossibile*: (3) when it comes to the proposed conclusion
 but not according to the mode of inquiry appropriate to the
 case, as happens when a non-medical argument is taken to
 be a medical one, or one which is not geometrical for a
 10 geometrical argument, or one which is not dialectical for
 dialectical, whether the result reached be true or false:
 (4) if the conclusion be reached through false premisses:
 of this type the conclusion is sometimes false, sometimes
 true: for while a false conclusion is always the result of
 false premisses, a true conclusion may be drawn even from
 15 premisses that are not true, as was said above as well.³

Fallacy in argument is due to a mistake of the arguer
 rather than of the argument: yet it is not always the fault
 of the arguer either, but only when he is not aware of it:
 for we often accept on its merits in preference to many true

¹ 162^a 32. Read αὕτη δόξα ἀκριβεστέρα ἐστίν, with best MSS.

² 162^b 2. Read συμπεραινόμενος.

³ * 10.

ones an argument which demolishes some true proposition,¹ if it does so from premisses as far as possible generally 20 accepted. For an argument of that kind does demonstrate other things that are true: for one of the premisses laid down ought never to be there at all, and this will then be demonstrated. If, however, a true conclusion were to be reached through premisses that are false and utterly childish, the argument is worse than many arguments that lead to a false conclusion, though an argument which leads to a false conclusion may also be of this type. Clearly then the first thing to ask in regard to the argument in 25 itself is, 'Has it a conclusion?'; the second, 'Is the conclusion true or false?'; the third, 'Of what kind of premisses does it consist?': for if the latter, though false, be generally accepted, the argument is dialectical, whereas if, though true, they be generally rejected, it is bad: if they be both false and also entirely contrary to general opinion, clearly it is bad, either altogether or else in relation to the particular matter in hand. 30

- 13 Of the ways in which a questioner may beg the original question and also beg contraries the true account has been given in the *Analytics*:² but an account on the level of general opinion must be given now.

People appear to beg their original question in five ways: the first and most obvious being if any one begs 35 the actual point requiring to be shown: this is easily detected when put in so many words; but it is more apt to escape detection in the case of different terms, or a term and an expression, that mean the same thing. A second 163^a way occurs whenever any one begs universally something which he has to demonstrate in a particular case: suppose (e.g.) he were trying to prove that the knowledge of contraries is one and were to claim that the knowledge of opposites in general is one: for then he is generally thought to be begging, along with a number of other things, that which he ought to have shown by itself. A third way is if any one were to beg in particular cases 5

¹ i.e. a *reductio ad absurdum*.

² *An. Pr.* ii. 16.

what he undertakes to show universally: e. g. if he undertook to show that the knowledge of contraries is always one, and begged it of certain pairs of contraries: for he also is generally considered to be begging independently and by itself what, together with a number of other things, he ought to have shown. Again, a man begs the question if he begs his conclusion piecemeal: supposing e. g. that he had to show that medicine is a science of what leads to
 10 health and to disease, and were to claim first the one, then the other; or, fifthly, if he were to beg the one or the other of a pair of statements that necessarily involve one other; e. g. if he had to show that the diagonal is incommensurable with the side, and were to beg that the side is incommensurable with the diagonal.

The ways in which people assume contraries are equal in number to those in which they beg their original question.
 15 For it would happen, firstly, if any one were to beg an opposite affirmation and negation; secondly, if he were to beg the contrary terms of an antithesis, e. g. that the same thing is good and evil; thirdly, suppose any one were to claim something universally and then proceed to beg its contradictory in some particular case, e. g. if having secured that the knowledge of contraries is one, he were to claim that the knowledge of what makes for health or for disease is
 20 different; or, fourthly, suppose him, after postulating the latter view, to try to secure universally the contradictory statement. Again, fifthly, suppose a man begs the contrary of the conclusion which necessarily comes about through the premisses laid down; and this would happen suppose, even without begging the opposites in so many words, he were to beg two premisses such that this contradictory statement that is opposite to the first conclusion will follow from them. The securing of contraries differs from begging
 25 the original question in this way: in the latter case the mistake lies in regard to the conclusion; for it is by a glance at the conclusion that we tell that the original question has been begged: whereas contrary views lie in the premisses, viz. in a certain relation which they bear to one another.

14 The best way to secure training and practice in arguments of this kind is in the first place to get into the habit of 30 converting the arguments. For in this way we shall be better equipped for dealing with the proposition stated, and after a few attempts we shall know several arguments by heart. For by 'conversion' of an argument is meant the taking the reverse of the conclusion together with the remaining propositions asked and so demolishing one of those that were conceded: for it follows necessarily that if the conclusion be untrue, some one of the premisses is 35 demolished, seeing that, given all the premisses, the conclusion was bound to follow. Always, in dealing with any proposition, be on the look-out for a line of argument both pro and con: and on discovering it at once set about looking 163^b for the solution of it: for in this way you will soon find that you have trained yourself at the same time in both asking questions and answering them. If we cannot find any one else to argue with, we should argue with ourselves. Select, moreover, arguments relating to the same thesis¹ and range them side by side: for this produces a plentiful 5 supply of arguments for carrying a point by sheer force, and in refutation also it is of great service, whenever one is well stocked with arguments pro and con: for then you find yourself on your guard against contrary statements to the one you wish to secure. Moreover, as contributing to knowledge and to philosophic wisdom the power of discerning and holding in one view the results of either of two 10 hypotheses is no mean instrument; for it then only remains to make a right choice of one of them. For a task of this kind a certain natural ability is required: in fact real natural ability just is the power rightly to choose the true and shun the false. Men of natural ability can do this; for 15 by a right liking or disliking for whatever is proposed to them they rightly select what is best.

It is best to know by heart arguments upon those questions which are of most frequent occurrence, and particularly in regard to those propositions which are ultimate: for in discussing these answerers frequently give up in despair.

¹ 163^b 4-5. Read *ἐκλέγοντα πρὸς τὴν αὐτὴν θέσιν*.

Moreover, get a good stock of definitions: and have those of familiar and primary ideas at your fingers' ends: for it is through these that reasonings are effected. You should try, moreover, to master the heads under which other arguments mostly tend to fall. For just as in geometry it is useful to be practised in the elements, and in arithmetic to have the multiplication table up to ten at one's fingers' ends—and indeed it makes a great¹ difference in one's knowledge of the multiples of other numbers too—likewise also in arguments it is a great advantage to be well up in regard to first principles, and to have a thorough knowledge of premisses at the tip of one's tongue. For just as in a person with a trained memory, a memory of things themselves is immediately caused by the mere mention of their *loci*, so these habits too will make a man readier in reasoning, because he has his premisses classified before his mind's eye, each under its number. It is better to commit to memory a premiss of general application than an argument: for it is difficult to be even moderately ready with a first principle, or hypothesis.

Moreover, you should get into the habit of turning one argument into several, and conceal your procedure as darkly as you can: this kind of effect is best produced by keeping as far as possible away from topics akin to the subject of the argument. This can be done with arguments that are entirely universal, e. g. the statement that 'there cannot be one knowledge of more than one thing': for that is the case with both relative terms and contraries and co-ordinates.

Records of discussions should be made in a universal form, even though one has argued only some particular case: for this will enable one to turn a single rule into several. A like rule applies in Rhetoric as well to enthymemes. For yourself, however, you should as far as possible avoid universalizing your reasonings. You should, moreover, always examine arguments to see whether they rest on principles of general application: for all particular arguments really reason universally, as well, i. e. a particular demonstration always contains a universal demonstration, because it is impossible to reason at all without using universals.²

¹ 163^b 25. Read ἔχειν, καὶ μέγα διαφέρει.

² Read in 164^a 11 τῶν καθόλου.

You should display your training in inductive reasoning against a young man, in deductive against an expert. You should try, moreover, to secure from those skilled in deduction their premisses, from inductive reasoners their parallel ¹⁵ cases; for this is the thing ¹ in which they are respectively trained. In general, too, from your exercises in argumentation you should try to carry away either a syllogism on some subject or a refutation or a proposition or an objection, or whether some one put his question properly or improperly (whether it was yourself or some one else) and the point which made it the one or the other. For this is what gives ^{164^b} one ability, and the whole object of training is to acquire ability, especially in regard to propositions and objections. For it is the skilled propounder and objector who is, speaking generally, a dialectician. To formulate a proposition is to form a number of things into one—for the conclusion ⁵ to which the argument leads must be taken generally, as a single thing ²—whereas to formulate an objection is to make one thing into many: for the objector either distinguishes or demolishes, partly granting, partly denying the statements proposed.

Do not argue with every one, nor practise upon the man in the street: for there are some people with whom any argument is bound to degenerate. For against any one ¹⁰ who is ready to try all means in order to seem not to be beaten, it is indeed fair to try all means of bringing about one's conclusion: but it is not good form. Wherefore the best rule is, not lightly to engage with casual acquaintances, or bad argument is sure to result. For you see how in practising together people cannot refrain from contentious ¹⁵ argument.

It is best also to have ready-made arguments relating to those questions in which a very small stock will furnish us with arguments serviceable on a very large number of occasions. These are those that are universal, and those in regard to which it is rather difficult to produce points for ourselves from matters of everyday experience.

² 164^b 5. Read *ἐν δὲ ὅλῳ ληφθῆναι*.

DE SOPHISTICIS ELENCHIS

I LET us now discuss sophistic refutations, i.e. what appear ^{164^a} ₂₀ to be refutations but are really fallacies instead. We will begin in the natural order with the first.

That some reasonings are genuine, while others seem to be so but are not, is evident. This happens with arguments, as also elsewhere, through a certain likeness between ₂₅ the genuine and the sham. For physically some people are in a vigorous condition, while others merely seem to be so by ^{164^b} ₂₀ blowing and rigging themselves out as the tribesmen do their victims for sacrifice; and some people are beautiful thanks to their beauty, while others seem to be so, by dint of embellishing themselves. So it is, too, with inanimate things; for of these, too, some are really silver and others gold, while others are not and merely seem to be such to our sense; e. g. things made of litharge and tin seem to be of silver, while those made of yellow metal look golden. In the same way ₂₅ both reasoning and refutation are sometimes genuine, sometimes not, though inexperience may make them appear so: for inexperienced people obtain only, as it were, a distant view of these things. For reasoning rests on certain state- ^{165^a} _{ments} such that they involve necessarily the assertion of something other than what has been stated, through what has been stated: refutation is reasoning involving the contradictory of the given conclusion. Now some of them do not really achieve this, though they seem to do so for a number of reasons; and of these the most prolific and usual domain is the argument that turns upon names only. It is impossible, in a discussion to bring in the actual things discussed; we use their names as symbols instead of them; and therefore we suppose that what follows in the names, follows in the things as well, just as people who calculate suppose in regard to their counters. But the two cases (names and ₁₀ things) are not alike. For names are finite and so is the sum-total of formulae, while things are infinite in number.

Inevitably, then, the same formulae, and a single name, have a number of meanings. Accordingly just as, in counting, those who are not clever in manipulating their counters are
 15 taken in by the experts, in the same way in arguments too those who are not well acquainted with the force of names misreason both in their own discussions and when they listen to others. For this reason, then, and for others to be mentioned later, there exists both reasoning and refutation that is apparent but not real. Now for some people it is
 20 better worth while to seem to be wise, than to be wise without seeming to be (for the art of the sophist is the semblance of wisdom without the reality, and the sophist is one who makes money from an apparent but unreal wisdom); for them, then, it is clearly essential also to seem to accomplish the task of a wise man rather than to accomplish it without seeming to do so. To reduce it to a single point
 25 of contrast it is the business of one who knows a thing, himself to avoid fallacies in the subjects which he knows and to be able to show up the man who makes them; and of these accomplishments the one depends on the faculty to render an answer, and the other upon the securing of one. Those, then, who would be sophists are bound to study the class of arguments aforesaid: for it is worth their while:
 30 for a faculty of this kind will make a man seem to be wise, and this is the purpose they happen to have in view.

Clearly, then, there exists a class of arguments of this kind, and it is at this kind of ability that those aim whom we call sophists. Let us now go on to discuss how many kinds there are of sophistical arguments, and how many in
 35 number are the elements of which this faculty is composed, and how many branches there happen to be of this inquiry, and the other factors that contribute to this art.

Of arguments in dialogue form there are four classes: 2

Didactic, Dialectical, Examination-arguments, and Con-
 165^b tentious arguments. Didactic arguments are those that reason from the principles appropriate to each subject and not from the opinions held by the answerer (for the learner should take things on trust): dialectical arguments are

those that reason from premisses generally accepted, to the contradictory of a given thesis: examination-arguments are those that reason from premisses which are accepted by 5 the answerer and which any one who pretends to possess knowledge of the subject is bound to know—in what manner, has been defined in another treatise: ¹ contentious arguments are those that reason or appear to reason to a conclusion from premisses that appear to be generally accepted but are not so. The subject, then, of demonstrative arguments has been discussed in the *Analytics*, while that of dialectic arguments and examination-arguments has 10 been discussed elsewhere: ² let us now proceed to speak of the arguments used in competitions and contests.

- 3 First we must grasp the number of aims entertained by those who argue as competitors and rivals to the death. These are five in number, refutation, fallacy, paradox, solecism, and fifthly to reduce the opponent in the discussion 15 to babbling—i. e. to constrain him to repeat himself a number of times: or it is to produce the appearance of each of these things without the reality. For they choose if possible plainly to refute the other party, or as the second best to show that he is committing some fallacy, or as a third best to lead him into paradox, or fourthly to reduce him to solecism, i. e. to make the answerer, in consequence 20 of the argument, to use an ungrammatical expression; or, as a last resort, to make him repeat himself.
- 4 There are two styles of refutation: for some depend on the language used, while some are independent of language. Those ways of producing the false appearance of an 25 argument which depend on language are six in number: they are ambiguity, amphiboly, combination, division of words, accent, form of expression. Of this we may assure ourselves both by induction, and by syllogistic proof based on this—and it may be on other assumptions as well—that this is the number of ways in which we might fail to mean the same thing by the same names or expressions. Arguments such as the following depend upon ambiguity. 30

¹ *Top.* viii. 5.

² *Top.* i-viii.

'Those learn who know: for it is those who know their letters who learn the letters dictated to them.' For to 'learn' is ambiguous; it signifies both 'to understand' by the use of knowledge, and also 'to acquire knowledge'. Again, 'Evils are good: for what needs to be is good, and
 35 evils must needs be.' For 'what needs to be' has a double meaning: it means what is inevitable, as often is the case with evils, too (for evil of some kind is inevitable), while on the other hand we say of good things as well that they 'need to be'. Moreover, 'The same man is both seated and standing and he is both sick and in health: for it is he who stood up who is standing, and he who is recovering
 166^a who is in health: but it is the seated man who stood up, and the sick man who was recovering.' For 'The sick man does so and so', or 'has so and so done to him' is not single in meaning: sometimes it means 'the man who is sick or is seated now', sometimes 'the man who was sick formerly'. Of course, the man who was recovering was
 5 the sick man, who really was sick at the time: but the man who is in health is not sick at the same time: he is 'the sick man' in the sense not that he is sick now, but that he was sick formerly. Examples such as the following depend upon amphiboly: 'I wish that you the enemy may capture.' Also the thesis, 'There must be knowledge of what one knows': for it is possible by this phrase to mean that knowledge belongs to both the knower and the known. Also, 'There must be sight of what one sees: one sees the
 10 pillar: *ergo* the pillar has sight'. Also, 'What you profess to-be, that you profess-to-be: you profess a stone to-be: *ergo* you profess-to-be a stone.' Also, 'Speaking of the silent is possible': for 'speaking of the silent' also has a double meaning: it may mean that the speaker is silent or that the things of which he speaks are so.¹ There are
 15 three varieties of these ambiguities and amphibolies: (1) When either the expression or the name has strictly more than one meaning, e. g. *ἄερὸς* and the 'dog'; (2) when by custom we use them so; (3) when words that have a simple sense taken alone have more than one meaning in com-

¹ Cf. Pl. *Euthyd.* 300 B-C.

bination ; e.g. 'knowing letters'. For each word, both 'knowing' and 'letters', possibly has a single meaning: 20 but both together have more than one—either that the letters themselves have knowledge or that some one else has it of them.

Amphiboly and ambiguity, then, depend on these modes of speech. Upon the combination of words there depend instances such as the following: 'A man can walk while sitting, and can write while not writing'. For the meaning is not the same if one divides the words and if one com- 25 bines them in saying that 'it is possible to walk-while-sitting' [and write while not writing].¹ The same applies to the latter phrase, too, if one combines the words 'to write-while-not-writing': for then it means that he has the power to write and not to write at once ; whereas if one does not combine them, it means that when he is not writing he has the power to write. Also, 'He knows now if 30 he has learnt his letters.'² Moreover, there is the saying that 'One single thing if you can carry a crowd you can carry too':

Upon division depend the propositions that 5 is 2 and 3, and even and odd, and that the greater is equal : for it is that amount and more besides. For the same phrase would not 35 be thought always to have the same meaning when divided and when combined, e.g. 'I made thee a slave once a free man',³ and 'God-like Achilles left fifty a hundred men'.⁴

An argument depending upon accent it is not easy to construct in unwritten discussion ; in written discussions and 166^b in poetry it is easier. Thus (e.g.) some people emend Homer against those who criticize as unnatural his expression τὸ μὲν οὐ καταπύθεται ὄμβρῳ.⁵ For they solve the difficulty by a change of accent, pronouncing the *ou* with an acuter accent. 5 Also, in the passage about Agamemnon's dream, they say that Zeus did not himself say 'We grant him the fulfilment

¹ 166^a 26-7. The words καὶ μὴ γράφοντα γράφειν should probably be omitted : and read τὸ καθήμενον (26) and τὸ μὴ γράφοντα (27).

² 166^a 30. Read μανθάνει τὸν γράμματι εἴπερ ἐμάνθανεν, omitting ἢ ἐπίσταται.

³ Source unknown, but cf. Terence, *Andria*, i. i. 10.

⁴ Source unknown. ⁵ *Iliad*, Ψ. 328.

of his prayer',¹ but that he bade the dream grant it. Instances such as these, then, turn upon the accentuation.

- 10 Others come about owing to the form of expression used, when what is really different is expressed in the same form, e.g. a masculine thing by a feminine termination, or a feminine thing by a masculine, or a neuter by either a masculine or a feminine; or, again, when a quality is expressed by a termination proper to quantity or vice versa, or what is active by a passive word, or a state by an active word, and so forth with the other divisions previously² laid down. For it is possible to use an expression to denote what does not belong to the class of actions at all as though it did so belong. Thus (e.g.) 'flourishing' is a word which in the form of its expression is like 'cutting' or 'building': yet the one denotes a certain quality—i.e. a certain condition—while the other denotes a certain action. In the same manner also in the other instances.

- 20 Refutations, then, that depend upon language are drawn from these common-place rules. Of fallacies, on the other hand, that are independent of language there are seven kinds:

- (1) that which depends upon Accident:
- (2) the use of an expression absolutely or not absolutely but with some qualification of respect, or place, or time, or relation:
- (3) that which depends upon ignorance of what 'refutation' is:
- 25 (4) that which depends upon the consequent:
- (5) that which depends upon assuming the original conclusion:³
- (6) stating as cause what is not the cause:
- (7) the making of more than one question into one.

Fallacies, then, that depend on Accident occur whenever 5 any attribute is claimed to belong in a like manner to a thing and to its accident. For since the same thing has

¹ The words occur not in the passage referred to, *Iliad*, B. 1-35, but in *Φ*. 297.

² *Τοφ*. i. 9.

³ Read, with Strache, *παρὰ τὸ <τὸ> εἶν ἀρχῇ λαμβάνειν*.

many accidents there is no necessity that all the same attributes¹ should belong to all of a thing's predicates and to their subject as well. Thus (e. g.), 'If Coriscus be different from "man", he is different from himself, for he is a man': or 'If he be different from Socrates, and Socrates be a man, then', they say, 'he has admitted that Coriscus is different 35 from a man, because it so happens (*accidit*) that the person from whom he said that he Coriscus is different is a man'.

Those that depend on whether an expression is used absolutely or in a certain respect and not strictly, occur whenever an expression used in a particular sense is taken as though it were used absolutely e. g. in the argument: 'If 167^a what is not is the object of an opinion, then what is not is': for it is not the same thing 'to be' and 'to be' absolutely. Or again, 'What is, is not' is not a particular kind of being, e. g. if it is not a man. For it is not the same thing 'not to be *x*' and 'not to be' at all: it looks as if it were, because of the closeness of the expression, i. e. because 'to be *x*' is but little different from 'to be' and 'not to be *x*' from 'not to be'. Likewise also with any argument that turns upon the point whether an expression is used in a certain respect or used absolutely. Thus e. g. 'Suppose an Indian to be black all over but white in respect of his teeth: then he is both white and not white. Or if both characters belong in a particular respect, then, they say, 'contrary attributes belong at the same time'. This kind .o of thing is in some cases easily seen by any one, e. g. suppose a man were to secure the statement that the Ethiopian is black, and were then to ask whether he is white in respect of his teeth; and then, if he be white in that respect, were to suppose at the conclusion of his questions that therefore he had proved dialectically that he was both white and not white. But in some cases it often passes undetected, viz. in all cases where, whenever a statement is made of something in a certain respect, it would be gener- 15 ally thought that the absolute statement follows as well; and also in all cases where it is not easy to see which of the attributes ought to be rendered strictly. A situation of

¹ 166^b 32. Read *μήτις*.

this kind arises, where both the opposite attributes belong alike: for then there is general support for the view that one must agree absolutely to the assertion of both, or of neither: e. g. if a thing is half white and half black, is it
 20 white or black?

Other fallacies occur because the terms 'proof' or 'refutation' have not been defined, and because something is left out in their definition. For to refute is to contradict one and the same attribute—not merely the name, but the reality—and a name that is not merely synonymous but the
 25 same name—and to confute it from the propositions granted, necessarily, without including in the reckoning the original point to be proved, in the same respect and relation and manner and time in which it was asserted. A 'false assertion' about anything has to be defined in the same way. Some people, however, omit some one of the said conditions and give a merely apparent refutation, showing (e. g.) that the same thing is both double and not double: for two
 30 is double of one, but not double of three. Or, it may be, they show that it is both double and not double of the same thing, but not that it is so in the same respect: for it is double in length but not double in breadth. Or, it may be, they show it to be both double and not double of the same thing and in the same respect and manner, but not that it is so at the same time: and therefore their refutation is merely
 35 apparent. One might, with some violence, bring this fallacy into the group of fallacies dependent on language as well.

Those that depend on the assumption of the original point to be proved, occur in the same way, and in as many ways, as it is possible to beg the original point; they appear to refute because men lack the power to keep their eyes at once upon what is the same and what is different.

167^b The refutation which depends upon the consequent arises because people suppose that the relation of consequence is convertible. For whenever, suppose *A* is, *B* necessarily is, they then suppose also that if *B* is, *A* necessarily is. This
 5 is also the source of the deceptions that attend opinions based on sense-perception. For people often suppose bile

to be honey because honey is attended by a yellow colour : also, since after rain the ground is wet in consequence, we suppose that if the ground is wet, it has been raining ; whereas that does not necessarily follow. In rhetoric proofs from signs are based on consequences. For when rhetoricians wish to show that a man is an adulterer, they 10 take hold of some consequence of an adulterous life, viz. that the man is smartly dressed, or that he is observed to wander about at night. There are, however, many people of whom these things are true, while the charge in question is untrue. It happens like this also in real reasoning ; e.g. Melissus' argument, that the universe is eternal, assumes that the universe has not come to be (for from what is not nothing could possibly come to be) and that what has come 15 to be has done so from a first beginning. If, therefore, the universe has not come to be, it has no first beginning, and is therefore eternal. But this does not necessarily follow : for even if what has come to be always has a first beginning, it does not also follow that what has a first beginning has come to be ; any more than it follows that if a man in a fever be hot, a man who is hot must be in a fever. 20

The refutation which depends upon treating as cause what is not a cause, occurs whenever what is not a cause is inserted in the argument, as though the refutation depended upon it. This kind of thing happens in arguments that reason *ad impossibile* : for in these we are bound to demolish one of the premisses. If, then, the false cause be reckoned in among the questions that are necessary to 25 establish the resulting impossibility, it will often be thought that the refutation depends upon it, e.g. in the proof that the 'soul' and 'life' are not the same : for if coming-to-be be contrary to perishing, then a particular form of perishing will have a particular form of coming-to-be as its contrary : now death is a particular form of perishing and is contrary to life : life, therefore, is a coming-to-be, and to live is to come-to-be. But this is impossible : accordingly, the 'soul' 30 and 'life' are not the same. Now this is not proved : for the impossibility results all the same, even if one does not say that life is the same as the soul, but merely says that

life is contrary to death, which is a form of perishing, and that perishing has 'coming-to-be' as its contrary. Arguments of that kind, then, though not inconclusive absolutely, 35 are inconclusive in relation to the proposed conclusion. Also even the questioners themselves often fail quite as much to see a point of that kind.

Such, then, are the arguments that depend upon the consequent and upon false cause. Those that depend upon the making of two questions into one occur whenever the plurality is undetected and a single answer is returned as if 168^a to a single question. Now, in some cases, it is easy to see that there is more than one, and that an answer is not to be given, e.g. 'Does the earth consist of sea, or the sky?' But in some cases it is less easy, and then people treat the question as one, and either confess their defeat by failing to answer the question, or are exposed to an apparent refutation. 5 Thus 'Is *A* and is *B* a man?' 'Yes.' 'Then if any one hits *A* and *B*, he will strike a man' (singular), 'not men' (plural). Or again, where part is good and part bad, 'is the whole good or bad?' For whichever he says, it is possible that he might be thought to expose himself to an 10 apparent refutation or to make an apparently false statement: for to say that something is good which is not good, or not good which is good, is to make a false statement. Sometimes, however, additional premisses may actually give rise to a genuine refutation; e.g. suppose a man were to grant that the descriptions 'white' and 'naked' and 'blind' apply to one thing and to a number of things in a like sense. For if 'blind' describes a thing that cannot see though nature designed it to see, it will also describe things that cannot 15 see though nature designed them to do so. Whenever, then, one thing can see while another cannot, they will either both be able to see or else both be blind; which is impossible.

The right way, then, is either to divide apparent proofs 6 and refutations as above, or else to refer them all to ignorance of what 'refutation' is, and make that our starting-point: for it is possible to analyse all the aforesaid modes 20 of fallacy into breaches of the definition of a refutation.

In the first place, we may see if they are inconclusive: for the conclusion ought to result from the premisses laid down, so as to compel us necessarily to state it and not merely to seem to compel us. Next we should also take the definition bit by bit, and try the fallacy thereby. For of the fallacies that consist in language, some depend upon a double meaning, e. g. ambiguity of words and of phrases, and the fallacy of like verbal forms (for we habitually speak of ¹⁵ everything as though it were a particular substance)—while fallacies of combination and division and accent arise because the phrase in question or the term as altered¹ is not the same as was intended. Even this, however, should be the same, just as the thing signified should be as well, if a refutation or proof is to be effected; e. g. if the point concerns a doublet, then you should draw the conclusion of a 'doublet', ³⁰ not of a 'cloak'. For the former conclusion also would be true, but it has not been proved; we need a further question to show that 'doublet' means the same thing, in order to satisfy any one who asks why you think your point proved.

Fallacies that depend on Accident are clear cases of *ignoratio elenchi* when once 'proof' has been defined. For the same definition ought to hold good of 'refutation' ³⁵ too, except that a mention of 'the contradictory' is here added: for a refutation is a proof of the contradictory. If, then, there is no proof as regards an accident of anything, there is no refutation. For supposing, when *A* and *B* are, *C* must necessarily be, and *C* is white, there is no necessity for it to be white on account of the syllogism. So, if the ⁴⁰ triangle has its angles equal to two right-angles, and it ^{168^b} happens to be a figure, or the simplest element or starting point, it is not because it is a figure or a starting point or simplest element that it has this character. For the demonstration proves the point about it not *qua* figure or *qua* simplest element, but *qua* triangle. Likewise also in other cases. If, then, refutation is a proof, an argument which argued *per accidens* could not be a refutation. It is, how- ⁵ ever, just in this that the experts and men of science generally suffer refutation at the hand of the unscientific:

¹ 168^a 28. Read τοῦνομα τὸ διαφέρον.

for the latter meet the scientists with reasonings constituted *per accidens*; and the scientists for lack of the power to draw distinctions either say 'Yes' to their questions, or
 10 else people suppose them to have said 'Yes', although they have not.¹

Those that depend upon whether something is said in a certain respect only or said absolutely, are clear cases of *ignoratio elenchi* because the affirmation and the denial are not concerned with the same point. For of 'white in a certain respect' the negation is 'not white in a certain respect', while of 'white absolutely' it is 'not white, absolutely'. If, then, a man treats the admission that
 15 a thing is 'white in a certain respect' as though it were said to be white absolutely, he does not effect a refutation, but merely appears to do so owing to ignorance of what refutation is.

The clearest cases of all, however, are those that were previously described² as depending upon the definition of a 'refutation': and this is also why they were called by that name. For the appearance of a refutation is produced because of the omission in the definition, and
 20 if we divide fallacies in the above manner, we ought to set 'Defective definition' as a common mark upon them all.

Those that depend upon the assumption of the original point and upon stating as the cause what is not the cause, are clearly shown to be cases of *ignoratio elenchi* through the definition thereof. For the conclusion ought to come about³ 'because these things are so',⁴ and this does not
 25 happen where the premisses are not causes of it: and again it should come about without taking into account the original point, and this is not the case with those arguments which depend upon begging the original point.

Those that depend upon the consequent are a branch of Accident: for the consequent is an accident, only it differs from the accident in this, that you may secure an admission of the accident in the case of one thing only (e.g. the
 30 identity of a yellow thing and honey and of a white thing

¹ 168^b 9. Read δόνας.

² 168^b 24 omitting αἴτια τοῦ.

³ 167^a 21-35.

⁴ Cf. *An. Pr.* A. i. 24^b 18.

and swan), whereas the consequent always involves more than one thing: for we claim that things that are the same as one and the same thing are also the same as one another, and this is the ground of a refutation dependent on the consequent. It is, however, not always true, e. g. suppose that *A* and *B* are 'the same' as *C per accidens*¹; for both 'snow' and the 'swan' are the same as something 'white'. Or again, as in Melissus' argument,² a man assumes that to 35 'have been generated' and to 'have a beginning' are the same thing, or to 'become equal' and to 'assume the same magnitude'. For because what has been generated has a beginning, he claims also that what has a beginning has been generated, and argues as though both what has been generated and what is finite³ were the same because each has a beginning. Likewise also in the case of things that 40 are made equal he assumes that if things that assume one 169^a and the same magnitude become equal, then also things that become equal assume one magnitude:⁴ i. e. he assumes the consequent. Inasmuch, then, as a refutation depending on accident consists in ignorance of what a refutation is, clearly so also does a refutation depending on the consequent. We shall have further to examine this in another 5 way as well.⁵

Those fallacies that depend upon the making of several questions into one consist in our failure to dissect⁶ the definition of 'proposition'. For a proposition is a single statement about a single thing. For the same definition applies to 'one single thing only' and to the 'thing', simply, e. g. to 'man' and to 'one single man only'; and likewise also 10 in other cases. If, then, a 'single proposition' be one which claims a single thing of a single thing, a 'proposition', simply, will also be the putting of a question of that kind. Now since a proof starts from propositions and refutation is a proof, refutation, too, will start from propositions. If, then, a proposition is a single statement about a single thing,

¹ 168^b 34. Omit λευκόν with *A* and *B*.

² Cf. 167^b 13.

³ 168^b 40. Read τὸ πεπερασμένον.

⁴ 169^b 2. Read λαμβάνειν with *A* and *B*.

⁵ Chs. 24, 28.

⁶ 169^a 7. Omitting ἢ μὴ διαιρεῖν with *A* and *B*.

it is obvious that this fallacy too consists in ignorance of
 15 what a refutation is: for in it what is not a proposition
 appears to be one. If, then, the answerer has returned an
 answer as though to a single question, there will be a refu-
 tation; while if he has returned one not really but appar-
 ently, there will be an apparent refutation of his thesis. All
 the types of fallacy,¹ then, fall under ignorance of what
 a refutation is, some of them² because the³ contradiction,
 20 which is the distinctive mark of a refutation, is merely
 apparent, and the rest failing to conform to the definition
 of a proof.

The deception comes about in the case of arguments that 7
 depend on ambiguity of words and of phrases because we
 are unable to divide the ambiguous term (for some terms it
 is not easy to divide, e. g. 'unity', 'being', and 'sameness'),
 25 while in those that depend on combination and division, it is
 because we suppose that it makes no difference whether the
 phrase be combined or divided, as is indeed the case with
 most phrases. Likewise also with those that depend on
 accent: for the lowering or raising of the voice upon
 a phrase is thought not to alter its meaning—with any
 phrase, or not with many. With those that depend on the
 30 form of expression it is because of the likeness of expres-
 sion. For it is hard to distinguish what kind of things are
 signified by the same and what by different kinds of expres-
 sion: for a man who can do this is practically next door to
 the understanding of the truth.⁴ A special reason why
 a man is liable to be hurried into assent to the fallacy is that
 we suppose every predicate of anything to be an individual
 thing, and we understand it as being one with the thing:
 and we therefore treat it as a substance: for it is to that
 35 which is one with a thing or substance, as also to substance
 itself, that 'individuality' and 'being' are deemed to belong
 in the fullest sense. For this reason, too, this type of fallacy
 is to be ranked among those that depend on language; in

¹ 169^a 18. Read *τρόποι*.

² 169^a 19 *παρά την λέξιν* appears to be a gloss.

³ 169^a 20. Read *φαινόμενη ἢ ἀντιφασίς* (Wallies).

⁴ 169^a 33. Read a full-stop at *τῶν ἁπλῶν*. Also, read *ἐπισπῶται*.

the first place, because the deception is effected the more readily when we are inquiring into a problem in company with others than when we do so by ourselves (for an inquiry with another person is carried on by means of speech, whereas an inquiry by oneself is carried on quite as much by means of the object itself); secondly a man is liable to be 40 deceived, even when inquiring by himself, when he takes 169^b speech as the basis of his inquiry: moreover the deception arises out of the likeness (of two different things), and the likeness arises out of the language. With those fallacies that depend upon Accident, deception comes about¹ because we cannot distinguish the sameness and otherness of terms, i.e. their unity and multiplicity, or what kinds of predicate 5 have all the same accidents as their subject. Likewise also with those that depend on the Consequent: for the consequent is a branch of Accident. Moreover, in many cases appearances point to this—and the claim is made—that if *A* is inseparable from *B*, so also is *B* from *A*. With those that depend upon an imperfection in the definition of a 10 refutation, and with those that depend upon the difference between a qualified and an absolute statement, the deception consists in the smallness of the difference involved; for we treat the limitation to the particular thing or respect or manner or time as adding nothing to the meaning, and so grant the statement universally. Likewise also in the case of those that assume the original point, and those of false cause, and all that treat a number of questions as one: for in all of them the deception lies in the smallness of the 15 difference: for our failure to be quite exact in our definition of 'premiss' and of 'proof' is due to the aforesaid reason.

- 8 Since we know on how many points apparent syllogisms depend, we know also on how many sophistical syllogisms and refutations may depend. By a sophistical refutation 20 and syllogism I mean not only a syllogism or refutation which appears to be valid but is not, but also one which, though it is valid, only appears to be appropriate to the thing in question. These are those which fail to refute and

¹ 169^b 3 sc. ἡ ἀνάγκη γίνεσθαι from 169^a 22, as also in 169^a 30.

prove people to be ignorant according to the nature of the thing in question, which was the function of the art of
 25 examination. Now the art of examining is a branch of dialectic: and this may prove a false conclusion because of the ignorance of the answerer. Sophistic refutations on the other hand, even though they prove the contradictory of his thesis, do not make clear whether he is ignorant: for sophists entangle the scientist as well with these arguments.
 30 That we know them by the same line of inquiry is clear: for the same considerations which make it appear to an audience that the points required for the proof were asked in the questions and that the conclusion was proved, would make the answerer think so as well, so that false proof will occur through all or some of these means: for what a man has not been asked but thinks he has granted, he would
 35 also grant if he were asked. Of course, in some cases the moment we add the missing question, we also show up its falsity, e. g. in fallacies that depend on language and on solecism. If then, fallacious proofs of the contradictory of a thesis depend on their appearing to refute, it is clear that the considerations on which both proofs of false conclusions and an apparent refutation depend must be the same in
 40 number. Now an apparent refutation depends upon the
 170^a elements involved in a genuine one: for the failure of one or other of these must make the refutation merely apparent, e. g. that which depends on the failure of the conclusion to follow from the argument (the argument *ad impossibile*) and that which treats two questions as one and so depends upon a flaw in the premiss, and that which depends on the substitution of an accident for an essential attribute, and—
 5 a branch of the last—that which depends upon the consequent: moreover, the conclusion may follow not in fact but only verbally: then, instead of proving the contradictory universally and in the same respect and relation and manner, the fallacy may be dependent on some limit of extent or on one or other of these qualifications: moreover, there is the assumption of the original point¹ to be proved, in violation of the clause 'without reckoning in the

¹ 170^a 9. Read τὸ (τὸ) ἐν ἀρχῇ λαμβάνειν.

original point'. Thus we should have the number of considerations on which the fallacious proofs depend: for they 10 could not depend on more, but all will depend on the points aforesaid.

A sophistical refutation is a refutation not absolutely but relatively to some one: and so is a proof, in the same way. For unless that which depends upon ambiguity assumes that the ambiguous term has a single meaning, and that which depends on like verbal forms assumes that substance 15 is the only category, and the rest in the same way, there will be neither refutations nor proofs, either absolutely or relatively to the answerer: whereas if they do assume these things, they will stand, relatively to the answerer; but absolutely they will not stand: for they have not secured a statement that does have a single meaning, but only one that appears to have, and that only from this particular man.

9 The number of considerations on which depend the 20 refutations of those who are refuted, we ought not to try to grasp without a knowledge of everything that is. This, however, is not the province of any special study: for possibly the sciences are infinite in number, so that obviously demonstrations may be infinite too. Now refutations may be true as well as false: for whenever it is possible to demonstrate something, it is also possible to refute the man who maintains the contradictory of the truth; e.g. 25 if a man has stated that the diagonal is commensurate with the side of the square, one might refute him by demonstrating that it is incommensurate. Accordingly, to exhaust all possible refutations we shall have to have scientific knowledge of everything: for some refutations depend upon the principles that rule in geometry and the conclusions that follow from these, others upon those that rule in medicine, and others upon those of the other sciences. For the matter of that, the false refutations like- 30 wise belong to the number of the infinite: for according to every art there is false proof, e.g. according to geometry there is false geometrical proof, and according to medicine there is false medical proof. By 'according to

the art'. I mean 'according to the principles of it'. Clearly, then, it is not of all refutations, but only of those
 35 that depend upon dialectic that we need to grasp the common-place rules: for these stand in a common relation to every art and faculty. And as regards the refutation that is according to one or other of the particular sciences it is the task of that particular scientist to examine whether it is merely apparent without being real, and, if it be real, what is the reason for it: whereas it is the business of dialecticians so to examine the refutation that proceeds from the common first principles that fall under no particular special study. For if we grasp the starting-points of the
 40 accepted proofs on any subject whatever we grasp those of
 170^b the refutations current on that subject. For a refutation is the proof of the contradictory of a given thesis, so that either one or two proofs of the contradictory constitute a refutation. We grasp, then, the number of considerations on which all such depend: if, however, we grasp this, we also grasp their solutions as well; for the objections to these
 5 are the solutions of them. We also grasp the number of considerations on which those refutations depend, that are merely apparent—apparent, I mean, not to everybody, but to people of a certain stamp; for it is an indefinite task if one is to inquire how many are the considerations that make them apparent to the man in the street. Accordingly it is clear that the dialectician's business is to be able to grasp on how many considerations depends the formation, through the common first principles, of a refutation that
 10 is either real or apparent, i. e. either dialectical or apparently dialectical, or suitable for an examination.

It is no true distinction between arguments which some 10 people draw when they say that some arguments are directed against the expression, and others against the thought expressed: for it is absurd to suppose that some
 15 arguments are directed against the expression and others against the thought, and that they are not the same. For what is failure to direct an argument against the thought except what occurs whenever a man does not in using the

expression think it to be used in his question in the same sense in which the person questioned granted it? And this is the same thing as to direct the argument against the expression. On the other hand, it is directed against the thought whenever a man uses the expression in the same sense which the answerer had in mind when he granted it. If now any one (i. e. both the questioner and the person 30 questioned), in dealing with an expression with more than one meaning, were to suppose it to have one meaning—as e. g. it may be that ‘Being’ and ‘One’ have many meanings, and yet both the answerer answers and the questioner¹ puts his question supposing it to be one, and the argument is to the effect that ‘All things are one’—will this discussion be directed any more against the expression than against the thought of the person questioned? If, on 35 the other hand, one of them² supposes the expression to have many meanings, it is clear that such a discussion will not be directed against the thought. Such being the meanings of the phrases in question, they clearly cannot describe two separate classes of argument. For, in the first place, it is possible for any such argument as bears more than one meaning to be directed against the expression and against the thought, and next it is possible for any argument whatsoever; for the fact of being directed against the thought consists not in the nature of the argument, but in the special attitude of the answerer towards the points he 30 concedes. Next, all of them may be directed to the expression. For ‘to be directed against the expression’ means in this doctrine ‘not to be directed against the thought’. For if not all are directed against either expression or thought, there will be certain other arguments directed neither against the expression nor against the thought, whereas they say that all must be one or the other, and divide them all as directed either against the expression or against the thought, while others (they say) there are none. But in 35 point of fact those that depend on mere expression are only a branch of those syllogisms that depend on a multiplicity

¹ 170^b 23. Omit Ζήνων—obviously a gloss.

² 170^b 25. Read διειλεγμένος; εἰ δ' ἕτερος . . .

of meanings. For the absurd statement has actually been made that the description 'dependent on mere expression' describes all the arguments that depend on language: whereas some of these are fallacies not because the answerer adopts a particular attitude towards them, but because the
 40 argument itself involves the asking of a question such as bears more than one meaning.

171^a It is, too, altogether absurd to discuss Refutation without first discussing Proof: for a refutation is a proof, so that one ought to discuss proof as well before describing false refutation: for a refutation of that kind is a merely
 5 apparent proof of the contradictory of a thesis. Accordingly, the reason of the falsity will be either in the proof or in the contradiction (for mention of the 'contradiction' must be added), while sometimes it is in both, if the refutation be merely apparent. In the argument that speaking of the silent is possible it lies in the contradiction, not in the proof; in the argument that one can give what one does
 10 not possess, it lies in both; in the proof that Homer's poem is a figure through its being a cycle it lies in the proof. An argument that does not fail in either respect is a true proof.

But, to return to the point whence our argument digressed,¹ are mathematical reasonings directed against the thought, or not? And if any one thinks 'triangle' to be a word with many meanings, and granted it in some
 15 different sense from the figure which was proved to contain two right angles, has the questioner here directed his argument against the thought of the former or not?

Moreover, if the expression bears many senses, while the answerer does not understand or suppose it to have them, surely the questioner here has directed his argument against his thought! Or how else ought he to put his question except by suggesting a distinction—suppose one's question to be 'Is speaking of the silent possible or not?'
 20 —as follows, 'Is² the answer "No" in one sense, but "Yes" in another?' If, then, any one were to answer that it was not possible in any sense and the other were to argue that it was, has not his argument been directed against the

¹ 170^b 40.² 171^a 19. Read εἰ γ' ἐρωτήσῃς, and ἦ in line 20.

thought of the answerer? Yet his argument is supposed to be one of those that depend on the expression. There is not, then, any definite kind of arguments that is directed against the thought. Some arguments are, indeed, directed against the expression: but these¹ are not all even apparent refutations, let alone all refutations. For there are also 15 apparent refutations which do not depend upon language, e. g. those that depend upon accident, and others.

If, however, any one claims that one should actually draw the distinction, and say, 'By "speaking of the silent" I mean, in one sense this and in the other sense that', surely to claim *this* is in the first place absurd (for sometimes the 30 questioner does not see the ambiguity of his question, and he cannot possibly draw a distinction which he does not think to be there): in the second place, what else but this will *didactic* argument be? For it will make manifest the state of the case to one who has never considered, and does not know or suppose that there is any other meaning but one. For what is there to prevent the same thing also happening to us in cases where there is no double meaning? 'Are the units in four equal to the twos? Observe that the 35 twos are contained in four in one sense in this way, in another sense in that.' Also, 'Is the knowledge of contraries one or not? Observe that some contraries are known, while others are unknown.' Thus the man who makes this claim seems to be unaware of the difference between didactic and dialectical argument, and of the fact 171^b that while he who argues didactically should not ask questions but make things clear himself, the other should merely ask questions.

- II Moreover, to claim a 'Yes' or 'No' answer is the business not of a man who is showing something, but of one who is holding an examination. For the art of examining is a branch of dialectic and has in view not the man who has 5 knowledge, but the ignorant pretender. *He*, then, is a dialectician who regards the common principles with their application to the particular matter in hand, while he who

¹ 171^a 24. Read *καίτοι οὐτοι*.

only appears to do this is a sophist. Now for contentious and sophistical reasoning: (1) one such is a merely apparent reasoning, on subjects on which dialectical reasoning is the proper method of examination, even though its conclusion be true: for it misleads us in regard to the cause: also (2) there are those misreasonings which do not conform to the line of inquiry proper to the particular subject, but are generally thought to conform to the art in question. For false diagrams of geometrical figures are not contentious (for the resulting fallacies conform to the subject of the art)—any more than is any false diagram that may be offered in proof of a truth—e.g. Hippocrates' figure or the squaring of the circle by means of the lunules. But Bryson's method of squaring the circle,¹ even if the circle is thereby squared, is still sophistical because it does not conform to the subject in hand.² So, then, any merely apparent reasoning about these things is a contentious argument, and any reasoning that merely appears to conform to the subject in hand, even though it be genuine reasoning, is a contentious argument: for it is merely apparent in its conformity to the subject-matter, so that it is deceptive and plays foul. For just as a foul in a race is a definite type of fault, and is a kind of foul fighting, so the art of contentious reasoning is foul fighting in disputation: for in the former case those who are resolved to win at all costs snatch at everything, and so in the latter case do contentious reasoners. Those, then, who do this in order to win the mere victory are generally considered to be contentious and quarrelsome persons, while those who do it to win a reputation with a view to making money are sophistical. For the art of sophistry is, as we said,³ a kind of art of money-making from a merely apparent wisdom, and this is why they aim at a merely apparent demonstration: and quarrelsome persons and sophists both employ the same arguments, but not with the same motives: and the same argument will be sophistical and contentious, but not in the

¹ On the various methods of attempting to square the circle, here and below (172^a 2-7), see Poste, *Soph. EL.*, Appendix F.

² Cf. 172^a 2-7 below. ³ 165^a 22.

same respect ; rather, it will be contentious in so far as its aim is an apparent victory, while in so far as its aim is an apparent wisdom, it will be sophistical : for the art of sophistry is a certain appearance of wisdom without the reality. The contentious argument stands in somewhat the 35 same relation to the dialectical as the drawer of false diagrams to the geometrician ; for it beguiles by misreasoning from the same principles as dialectic uses, just as the drawer of a false diagram beguiles the geometrician. But whereas the latter is not a contentious reasoner, because he bases his false diagram on the principles and conclusions that fall under the art of geometry, the argument which is 172^a subordinate to the principles of dialectic will yet clearly be contentious as regards other subjects. Thus, e. g., though the squaring of the circle by means of the lunules is not contentious. Bryson's solution is contentious : and the former argument cannot be adapted to any subject except geometry, because it proceeds from principles that are 5 peculiar to geometry, whereas the latter can be adapted as an argument against all the number of people who do not know what is or is not possible in each particular context : for it will apply to them all. Or there is the method whereby Antiphon squared the circle. Or again, an argument which denied that it was better to take a walk after dinner, because of Zeno's argument, would not be a proper argument for a doctor, because Zeno's argument is of general application. If, then, the relation of the contentious argument to the dialectical were exactly like that of 10 the drawer of false diagrams to the geometrician, a contentious argument upon the aforesaid subjects could not have existed. But, as it is, the dialectical argument is not concerned with any definite kind of being, nor does it show anything, nor is it even an argument such as we find in the general philosophy of being. For all beings are not contained in any one kind, nor, if they were, could they possibly fall under the same principles. Accordingly, no 15 art that is a method of showing the nature of anything proceeds by asking questions : for it does not permit a man to grant whichever he likes of the two alternatives in the

question: for they will not both of them yield a proof. Dialectic, on the other hand, does proceed by questioning, whereas if it were concerned to show things, it would have refrained from putting questions, even if not about everything, at least about the first principles and the special principles that apply to the particular subject in hand. For
 20 suppose the answerer not to grant these,¹ it would then no longer have had any grounds from which to argue any longer against the objection. Dialectic is at the same time a mode of examination as well. For neither is the art of examination an accomplishment of the same kind as geometry, but one which a man may possess, even though he has not knowledge. For it is possible even for one without knowledge to hold an examination of one who is without knowledge, if also the latter grants him points
 25 taken not from things that he knows or from the special principles of the subject under discussion but from all that range of consequences attaching to the subject which a man may indeed know without knowing the theory of the subject, but which if he do not know, he is bound to be ignorant of the theory. So then clearly the art of examining does not consist in knowledge of any definite subject. For this reason, too, it deals with everything: for every
 30 ciples. Hence everybody, including even amateurs, makes use in a way of dialectic and the practice of examining: for all undertake to some extent a rough trial of those who profess to know things. What serves them here is the general principles: for they know these of themselves just as well as the scientist, even if in what they say they seem to the latter to go wildly astray from them. All, then, are engaged in refutation; for they take a hand as amateurs in
 35 the same task with which dialectic is concerned professionally; and he is a dialectician who examines by the help of a theory of reasoning. Now there are many identical principles which are true of everything,² though they are not such as to constitute a particular nature, i. e. a particular

¹ 172^a 20. Read διδόντος.

² 172^a 36. Read ταῦτά κατὰ πάντων (BC have ταῦτά and AB have no καί).

kind of being, but are like negative terms, while other principles are not of this kind but are special to particular subjects; accordingly it is possible from these general principles to hold an examination on everything, and that there should be a definite art of so doing, and, moreover, an art which is not of the same kind as those which demonstrate.¹ This is why the contentious reasoner does not stand in the same condition in all respects as the drawer of a false diagram: for the contentious reasoner will not be given to misreasoning from any definite class of principles, but will deal with every class.

These, then, are the types of sophistical refutations: and that it belongs to the dialectician to study these, and to be able to effect them, is not difficult to see: for the investigation of premisses comprises the whole of this study.

- 12 So much, then, for apparent refutations. As for showing that the answerer is committing some fallacy, and drawing his argument into paradox—for this was the second item of the sophist's programme²—in the first place, then, this is best brought about by a certain manner of questioning and through the question. For to put the question without framing it with reference to any definite subject is a good bait for these purposes: for people are more inclined to make mistakes when they talk at large, and they talk at large when they have no definite subject before them. Also the putting of several questions, even though the position against which one is arguing be quite definite, and the claim that he shall say only what he thinks, create abundant opportunity for drawing him into paradox or fallacy, and also, whether to any of these questions he replies 'Yes' or replies 'No', of leading him on to statements against which one is well off for a line of attack. Nowadays, however, men are less able³ to play foul by these means than they were formerly: for people rejoin with the question, 'What has that to do with the original subject?' It is, too, an elementary rule for eliciting some

¹ 172^b 1. Read δεικνύουσιν.

² 165^b 19.

³ 172^b 19. Read δύνανται.

fallacy or paradox that one should never put a controversial question straight away, but say that one puts it from the wish for information: for the process of inquiry thus invited gives room for an attack.

- 25 A rule specially appropriate for showing up a fallacy is the sophistic rule, that one should draw the answerer on to the kind of statements against which one is well supplied with arguments: this can¹ be done both properly and improperly, as was said before.²

Again, to draw a paradoxical statement, look and see to what school of philosophers the person arguing with you
30 belongs, and then question him as to some point wherein their doctrine is paradoxical to most people: for with every school there is some point of that kind. It is an elementary rule in these matters to have a collection of the special 'theses' of the various schools among your propositions. The solution recommended as appropriate here, too, is to point out that the paradox does not come about because of the argument: whereas this is what his opponent always
35 really wants.

Moreover, argue from men's wishes and their professed opinions. For people do not wish the same things as they say they wish: they say what will look best, whereas they wish what appears to be to their interest: e.g. they say that a man ought to die nobly rather than to live in pleasure,
173^a and to live in honest poverty rather than in dishonourable riches; but they wish the opposite. Accordingly, a man who speaks according to his wishes must be led into stating the professed opinions of people, while he who speaks according to these must be led into admitting those that
5 people keep hidden away: for in either case they are bound to introduce a paradox; for they will speak contrary either to men's professed or to their hidden opinions.

The widest range of common-place argument for leading men into paradoxical statement is that which depends on the standards of Nature and of the Law: it is so that both Callicles is drawn as arguing in the *Gorgias*,³ and that all the men of old supposed the result to come about: for

¹ 172^b 26. Read *ἐστιν*.

² *Top.* ii. 5.

³ 482 E.

nature (they said) and law are opposites, and justice is a fine 10
 thing by a legal standard, but not by that of nature.
 Accordingly, they said, the man whose statement agrees
 with the standard of nature you should meet by the stan-
 dard of the law, but the man who agrees with the law by
 leading him to the facts of nature: for in both ways para-
 doxical statements may be committed. In their view the
 standard of nature was the truth, while that of the law was 15
 the opinion held by the majority. So that it is clear that
 they, too, used to try either to refute the answerer or to
 make him make paradoxical statements, just as the men of
 to-day do as well.

Some questions are such that in both forms the answer
 is paradoxical; e. g. 'Ought one to obey the wise or one's 20
 father?' and 'Ought one to do what is expedient or what
 is just?' and 'Is it preferable to suffer injustice or to do an
 injury?' You should lead people, then, into views oppo-
 site to the majority and to the philosophers; if any one
 speaks as do the expert reasoners, lead him into opposition
 to the majority, while if he speaks as do the majority, then
 into opposition to the reasoners. For some say that of 25
 necessity the happy man is just, whereas it is paradoxical to
 the many that a king should not be happy. To lead a man
 into paradoxes of this sort is the same as to lead him into
 the opposition of the standards of nature and law: for the
 law represents the opinion of the majority, whereas philo-
 sophers speak according to the standard of nature and 30
 the truth.

- 13 Paradoxes, then, you should seek to elicit by means of
 these common-place rules. Now as for making any one
 babble, we have already said what we mean by 'to babble'.¹
 This is the object in view in all arguments of the following
 kind: If it is all the same to state a term and to state its
 definition, the 'double' and 'double of half' are the same: 35
 if then 'double' be the 'double of half', it will be the
 'double of half of half'. And if, instead of 'double', 'double
 of half' be again put, then the same expression will be

¹ 165^b 16.

repeated three times, 'double of half of half of half'. Also 'desire is of the pleasant, isn't it?' But desire is conation for the pleasant: accordingly, 'desire' is 'conation for the
40 pleasant for the pleasant'.

173^b All arguments of this kind occur in dealing (1) with any relative terms which not only have relative genera, but are also themselves relative, and are rendered in relation to one and the same thing, as e. g. conation is conation for something, and desire is desire of something, and double is
5 double of something, i. e. double of half: also in dealing (2) with any terms which, though they be not relative terms at all, yet have their substance, viz. the things of which they are the states or affections or what not, indicated as well in their definition, they being predicated of these things. Thus e. g. 'odd' is a 'number containing a middle': but there is an 'odd number': therefore there is a 'number-containing-a-
10 middle number'. Also, if snub-ness be a concavity of the nose, and there be a snub nose, there is therefore a 'concave-nose nose'.

People sometimes appear to produce this result, without really producing it, because they do not add the question whether the expression 'double', just by itself, has any meaning or no, and if so, whether it has the same meaning, or a different one; but they draw their conclusion straight
15 away. Still it seems, inasmuch as the word is the same, to have the same meaning as well.

We have said before what kind of thing 'solecism' is.¹ 14 It is possible both to commit it, and to seem to do so without doing so, and to do so without seeming to do so. Suppose, as Protagoras used to say, that *μῆνις* ('wrath') and
20 *πῆληξ* ('helmet') are masculine: according to him a man who calls wrath a 'destructress' (*οὐλόμενην*) commits a solecism, though he does not seem to do so to other people, whereas he who calls it a 'destructor' (*οὐλόμενον*) commits no solecism though he seems to do so. It is clear, then, that any one could produce this effect by art as well: and

for this reason many arguments seem to lead to solecism which do not really do so, as happens in the case of refutations.

25

Almost all apparent solecisms depend upon the word 'this' (τόδε), and upon occasions when the inflection denotes neither a masculine nor a feminine object but a neuter. For 'he' (οὗτος) signifies a masculine, and 'she' (αὕτη) a feminine; but 'this' (τοῦτο), though meant to signify a neuter, often also signifies one or other of the former: e.g. 'What is this?' 'It is Calliope'; 'it is a log'; 'it is Coriscus'. Now in the masculine and feminine the inflections are all different, whereas in the neuter some are and some are not. Often, then, when 'this' (τοῦτο) has been granted, people reason as if 'him' (τοῦτον) had been said: and likewise also they substitute one inflection for another. The fallacy comes about because 'this' (τοῦτο) is a common form of several inflections: for 'this' signifies sometimes 'he' (οὗτος) and sometimes 'him' (τοῦτον). It should signify them alternately; when combined with 'is' (ἐστι) it should be 'he', while with 'being' it should be 'him': e.g. 'Coriscus (Κορίσκος) is', but 'being Coriscus' (Κορίσκον). It happens in the same way in the case of feminine nouns as well, and in the case of the so-called 'chattels' that have feminine or masculine designations. 40 For only those names which end in -ο and ν, have the designation proper to a chattel, e.g. ξύλον ('log'), σχοινίον ('rope'); those which do not end so have that of a masculine or feminine object, though some of them we apply to chattels: e.g. ἀσκός ('wine-skin') is a masculine noun, and κλίνη ('bed'), a feminine. For this reason in cases of this kind as well there will be a difference of the same sort between a construction with 'is' (ἐστι) or with 'being' (τὸ εἶναι). Also, Solecism resembles in a certain way those refutations which are said to depend on the like expression of unlike things. For, just as there we come upon a material solecism, so here we come upon a verbal: for 'man' is both a 'matter' for expression and also a 'word': and so is 'white'.

¹ 173^b 28. Read τὸ μὲν γάρ.

10 It is clear, then, that for solecisms we must try to construct our argument out of the aforesaid inflections.

These, then, are the types of contentious arguments, and the subdivisions of those types, and the methods for conducting them aforesaid. But it makes no little difference if the materials for putting the question be arranged in a certain manner with a view to concealment, as in the case of
15 dialectics. Following then upon what we have said, this must be discussed first.

With a view then to refutation, one resource is length— 15 for it is difficult to keep several things in view at once ; and to secure length the elementary rules that have been stated before¹ should be employed. One resource, on the other hand, is speed ; for when people are left behind they look
20 ahead less. Moreover, there is anger and contentiousness, for when agitated everybody is less able to take care of himself. Elementary rules for producing anger are to make a show of the wish to play foul, and to be altogether shameless. Moreover, there is the putting of one's questions alternately, whether one has more than one argument leading to the same conclusion, or whether one has arguments
25 to show both that something is so, and that it is not so : for the result is that he has to be on his guard at the same time either against more than one line, or against contrary lines, of argument. In general, all the methods described before² of producing concealment are useful also for purposes of contentious argument : for the object of concealment is to avoid detection, and the object of this is to deceive.

30 To counter those who refuse to grant whatever they suppose to help one's argument, one should put the question negatively, as though desirous of the opposite answer, or at any rate as though one put the question without prejudice ; for when it is obscure what answer one wants to secure, people are less refractory. Also when, in dealing with particulars, a man grants the individual case, when the induction is done³ you should often not put the universal

¹ 155^b 26-157^a 5.

² 155^b 26-157^a 5.

³ 174^a 34. Read *ἐπαγωγίτα*.

as a question, but take it for granted and use it: for some- 35
times people themselves suppose that they have granted it,
and also appear to the audience to have done so, for they
remember the induction and assume that the questions could
not have been put for nothing. In cases where there is no
term to indicate the universal, still you should avail yourself
of the resemblance of the particulars to suit your purpose;
for resemblance often escapes detection. Also, with a view
to obtaining your premiss, you ought to put it in your 40
question side by side with its contrary. E. g. if it were 174^b
necessary to secure the admission that 'A man should obey
his father in everything', ask 'Should a man obey his
parents in everything, or disobey them in everything?'; and
to secure that 'A number multiplied by a large number is
a large number', ask 'Should one agree that it is a large
number or a small one?' For then, if compelled to choose,
one will be more inclined to think it a large one: for the 5
placing of their contraries close beside them makes things
look big to men, both relatively and absolutely, and worse
and better.

A strong appearance of having been refuted is often
produced by the most highly sophistical of all the unfair
tricks of questioners, when without proving anything,
instead of putting their final proposition as a question, they 10
state it as a conclusion, as though they had proved that
'Therefore so-and-so is not true'.

It is also a sophistical trick, when a paradox has been
laid down, first to propose at the start some¹ view that is
generally accepted, and then claim that the answerer shall
answer what he thinks about it, and to put one's question
on matters of that kind in the form 'Do you think that . . .?'
For then, if the question be taken as one of the premisses 15
of one's argument, either a refutation or a paradox is bound
to result; if he grants the view, a refutation; if he refuses
to grant it or even to admit it as the received opinion,
a paradox; if he refuses to grant it, but admits that it is
the received opinion, something very like a refutation,
results.

¹ 174^b 13. Read τὸν (= τινός) for τοῦ.

Moreover, just as in rhetorical discourses, so also in those
 20 aimed at refutation, you should examine the discrepancies
 of the answerer's position either with his own statements,
 or with those of persons whom he admits to say and do
 aright, moreover with those of people who are generally
 supposed to bear that kind of character, or who are like
 them, or with those of the majority or of all men. Also
 just as answerers, too, often, when they are in process of
 being confuted, draw a distinction, if their confutation is
 15 just about to take place, so questioners also should resort to
 this from time to time to counter objectors, pointing out,
 supposing that against one sense of the words the objection
 holds, but not against the other, that they have taken it in
 the latter sense, as e.g. Cleophon does in the *Mandrobulus*.¹
 They should also break off their argument and cut down
 their other lines of attack, while in answering,² if a man
 perceives this being done beforehand, he should put in
 30 his objection and have his say first. One should also
 lead attacks sometimes against positions other than the
 one stated, on the understood condition that³ one cannot
 find lines of attack against the view laid down, as
 Lycophron did when ordered to deliver a eulogy upon the
 lyre. To counter those who demand 'Against what are
 you directing your effort?'⁴, since one is generally thought
 bound to state the charge made, while, on the other hand,
 35 some ways of stating it make the defence too easy,⁵ you
 should state as your aim only the general result that always
 happens in refutations,⁶ namely the contradiction of his
 thesis—viz. that your effort is to deny what he has affirmed,⁷
 or to affirm what he denied: don't say that you are trying
 to show that the knowledge of contraries is, or is not, the
 same. One must not ask one's conclusion in the form of

¹ Probably a dialogue by Speusippus; cf. I. Bywater in *Journal of Philology*, xii. 21–30, and P. Lang, *De Speusippi Academici Scriptis*, 39–41, 52.

² 174^b 29. Omit τόν.

³ Or perhaps, 'and interpret the latter so, if one cannot' &c.

⁴ 174^b 34. Read πρὸς τί ἐπιχειρεῖς;

⁵ 174^b 35. Read a comma after εὐφραδικτότερον.

⁶ 174^b 36. Read a comma after λέγειν, none after ἐλέγχους.

⁷ 174^b 36. Read ὅτι ὁ εἶπεν.

a premiss, while some conclusions should not even be put as questions at all ;¹ one should take and use it as granted. 40

16 We have now therefore dealt with the sources of questions, 175^a and the methods of questioning in contentious disputations : next we have to speak of answering, and of how solutions should be made, and of what requires them, and of what use is served by arguments of this kind.

The use of them, then, is, for philosophy, two-fold. For 5 in the first place, since for the most part they depend upon the expression, they put us in a better condition for seeing in how many senses any term is used, and what kind of resemblances and what kind of differences occur between things and between their names. In the second place they are useful for one's own personal researches ; for the man who 10 is easily committed to a fallacy by some one else, and does not perceive it, is likely to incur this fate of himself also on many occasions. Thirdly and lastly, they further contribute to one's reputation, viz. the reputation of being well trained in everything, and not inexperienced in anything : for that a party to arguments should find fault with them, if he cannot definitely point out their weakness, creates a suspicion, 15 making it seem as though it were not the truth of the matter but merely inexperience that put him out of temper.

Answerers may clearly see how to meet arguments of this kind, if our previous account was right of the sources whence fallacies came, and also our distinctions adequate of the forms of dishonesty in putting questions.² But it is not 20 the same thing to take an argument in one's hand and then to see and solve its faults, as it is to be able to meet it quickly while being subjected to questions : for what we know, we often do not know in a different context. Moreover, just as in other things speed³ is enhanced by training, so it is with arguments too, so that supposing we are un- 25 practised, even though a point be clear to us, we are often too late for the right moment. Sometimes too it happens as with diagrams ; for there we can sometimes analyse the figure, but not construct it again : so too in refutations,

¹ 174^b 39. Read *ἐντα δ' οὐδ' ἐρωτητέον* as parenthetical.

² Chs. 4-11, 15.

³ 175^a 24. Omitting *καὶ τὸ βραδύτερον*.

though we know the thing on which the connexion of
 30 the argument depends, we still are at a loss to split the
 argument apart.

First then, just as we say that we ought sometimes to 17
 choose to prove something in the general estimation rather
 than in truth, so also we have sometimes to solve arguments
 rather in the general estimation than according to the truth.
 For it is a general rule in fighting contentious persons, to
 treat them not as refuting, but as merely appearing to
 35 refute: for we say that they don't really prove their case,
 so that our object in correcting them must be to dispel the
 appearance of it. For if refutation be an unambiguous
 contradiction arrived at from certain views, there could be
 no need to draw distinctions against amphiboly and ambi-
 guity: for they do not effect a proof. The only motive for
 drawing further distinctions is that the conclusion reached
 40 looks like a refutation. What, then, we have to beware of,
 is not being refuted, but seeming to be, because of course
 the asking of amphibolies and of questions that turn upon
 175^b ambiguity, and all the other tricks of that kind, conceal
 even a genuine refutation, and make it uncertain who is
 refuted and who is not. For since one has the right at the
 end, when the conclusion is drawn, to say that the only
 5 denial made of one's statement is ambiguous, no matter
 how precisely he may have addressed his argument to the
 very same point as oneself, it is not clear whether one has
 been refuted: for it is not clear whether at the moment one
 is speaking the truth. If, on the other hand, one had drawn
 a distinction, and questioned him on the ambiguous term or
 the amphiboly, the refutation would not have been a matter
 of uncertainty. Also what is incidentally the object of
 contentious arguers, though less so nowadays than formerly,
 would have been fulfilled, namely that the person questioned
 10 should answer either 'Yes' or 'No': whereas nowadays the
 improper forms in which questioners put their questions
 compel the party questioned to add something to his answer
 in correction of the faultiness of the proposition as put:
 for certainly, if the questioner distinguishes his meaning

adequately, the answerer is bound to reply either 'Yes' or 'No'.

If any one is going to suppose that an argument which 15 turns upon ambiguity is a refutation, it will be impossible for an answerer to escape being refuted in a sense: for in the case of visible objects one is bound of necessity to deny the term one has asserted, and to assert what one has denied. For the remedy which some people have for this is quite unavailing. They say, not that Coriscus is both musical and unmusical, but that *this* Coriscus is musical 20 and *this* Coriscus unmusical. But this will not do, for to say '*this* Coriscus' is unmusical', or 'musical',² and to say '*this* Coriscus' is so, is to use the same expression: and this he is both affirming and denying at once. 'But perhaps they do not mean the same.' Well, nor did the simple name in the former case: so where is the difference?³ If, however, he is to ascribe to the one person the simple 25 title '*Coriscus*', while to the other he is to add the prefix 'one' or 'this', he commits an absurdity: for the latter is no more applicable to the one than to the other: for to whichever he adds it, it makes no difference.

All the same, since if a man does not distinguish the senses of an amphiboly, it is not clear whether he has been confuted or has not been confuted, and since in arguments the right to distinguish them is granted, it is evident that to grant 30 the question simply without drawing any distinction is a mistake, so that, even if not the man himself, at any rate his argument looks as though it had been refuted. It often happens, however, that, though they see the amphiboly, people hesitate to draw such distinctions, because of the dense crowd of persons who propose questions of the kind, in order that they may not be thought to be obstructionists 35 at every turn: then, though they would never have supposed that that was the point on which the argument turned, they often find themselves faced by a paradox. Accordingly, since the right of drawing the distinction

¹ 175^b 21. Read . . λόγος τὸ τοῦτον τὸν Κ.

² 175^b 22. Read ἄμυστον εἶναι (ἢ μουσικόν).

³ 175^b 24. Read ὥστε τί διαφέρει;

is granted, one should not hesitate, as has been said before.¹

If people never made ² two questions into one question, 40 the fallacy that turns upon ambiguity and amphiboly would not have existed either, but either genuine refutation or none. For what is the difference between asking 'Are 176^a Callias and Themistocles musical?' and what one might have asked if they, being different, had had one name? For if the term applied means more than one thing, he has asked more than one question. If then it be not right to demand simply to be given a single answer to two questions, it is evident that it is not proper to give a simple answer to 5 any ambiguous question, not even if the predicate be true of all the subjects, as some claim that one should. For this is exactly as though he had asked 'Are Coriscus and Callias at home or not at home?', supposing them to be both in or both out: for in both cases there is a number of propositions: for though the simple answer be true, that 10 does not make the question one. For it is possible for it to be true to answer even countless different questions when put to one, all together with either a 'Yes' or a 'No': but still one should not answer them with a single answer: for that is the death of discussion. Rather, the case is like as though different things had actually had the same name applied to them. If then, one should not give a single 15 answer to two questions, it is evident that we should not say simply 'Yes' or 'No' in the case of ambiguous terms either: for the remark is simply a remark, not an answer at all, although among disputants such remarks are loosely deemed to be answers, because they do not see what the consequence is.

As we said,³ then, inasmuch as certain refutations are 20 generally taken for such, though not such really, in the same way also certain solutions will be generally taken for solutions, though not really such. Now these, we say, must sometimes be advanced rather than the true solutions in contentious reasonings and in the encounter with ambi-

¹ 160^a 23 ff.

³ 164^b 25.

² 175^b 39. Read *ἐποίει*.

guity. The proper answer in saying what one thinks is to say 'Granted'; for in that way the likelihood of being refuted on a side issue is minimized. If, on the other hand, one is compelled to say something paradoxical, one should then be most careful to add that 'it seems' so: for in that way one avoids the impression of being either refuted or paradoxical. Since it is clear what is meant by 'begging the original question', and people think that they must at all costs overthrow the premisses¹ that lie near the conclusion, and plead in excuse for refusing to grant him some of them that he is begging the original question, so whenever any one claims from us a point such² as is bound to follow as a consequence from our thesis, but is false or paradoxical, we must plead the same: for the necessary consequences are generally held to be a part of the thesis itself.³ Moreover, whenever the universal has been secured not under a definite name, but by a comparison of instances, one should say that the questioner assumes it not in the sense in which it was granted nor in which he proposed it in the premiss: for this too is a point upon which a refutation often depends.

If one is debarred from these defences one must pass to the argument that the conclusion has not been properly shown, approaching it in the light of the aforesaid distinction between the different kinds of fallacy.⁴

In the case, then, of names that are used literally one is bound to answer either simply or by drawing a distinction: the tacit understandings implied in our statements, e.g. in answer to questions that are not put clearly but elliptically—it is upon this that the consequent refutation depends. For example, 'Is what belongs to Athenians the property of Athenians?' Yes. 'And so it is likewise in other cases. But observe; man belongs to the animal kingdom, doesn't he?' Yes. 'Then man is the property of the animal kingdom.' But this is a fallacy: for we say that man 'belongs to' the animal kingdom because he is

¹ 176^a 28. Read πάντως, ἂν [= ἂ ἂν] . . .

³ 176^a 32. Read αὐτῆς εἶναι δοκεῖ τῆς θέσεως.

⁴ Cf. ch. 6.

5 an animal, just as we say that Lysander 'belongs to' the Spartans, because he is a Spartan. It is evident, then, that where the premiss put forward is not clear, one must not grant it simply.

Whenever of two things it is generally thought that if the one is true the other is true of necessity, whereas, if the other is true, the first is not true of necessity, one should,
10 if asked which of them is true,¹ grant the smaller one: for the larger the number of premisses, the harder it is to draw a conclusion from them. If, again, the sophist tries to secure that *A* has a contrary while *B* has not,² suppose what he says is true, you should say that each has a contrary, only for the one there is no established name.

Since, again, in regard to some of the views they express,
15 most people would say that any one who did not admit them was telling a falsehood, while they would not say this in regard to some, e.g. to any matters whereon opinion is divided (for most people have no distinct view whether the soul of animals is destructible or immortal), accordingly (1) wherever it is uncertain in which of two senses the premiss proposed is usually meant—whether as maxims are (for people call by the name of 'maxims' both true opinions and
20 general assertions), or like the doctrine 'the diagonal of a square is incommensurate with its side':³ and moreover (2) whenever opinions are divided as to the truth, we then have subjects of which it is very easy to change the terminology undetected. For because of the uncertainty in which of the two senses the premiss contains the truth, one will not be thought to be playing any trick, while because of the division of opinion, one will not be thought to be telling a falsehood. Change the terminology therefore, for the
25 change⁴ will make the position irrefutable.

Moreover, whenever one foresees any question coming, one should put in one's objection and have one's say beforehand: for by doing so one is likely to embarrass the questioner most effectually.

³ 176^b 20. Read a comma, instead of a full-stop, after *ἀσύμμετρος*.

⁴ 176^b 24. Read *ἡ γὰρ μεταφορά*.

18 Inasmuch as a proper solution is an exposure of false reasoning, showing on what kind of question the falsity depends, and whereas 'false reasoning' has a double meaning—for it is used either if a false conclusion has been proved, or if there is only an apparent proof and no real one—there must be both the kind of solution just described,¹ and also the correction of a merely apparent proof, so as to show upon which of the questions the appearance depends. Thus it comes about that one solves arguments that are properly reasoned by demolishing them, whereas one solves merely apparent arguments by drawing distinctions. Again, inasmuch as of arguments that are properly reasoned some have a true and others a false conclusion, those that are false in respect of their conclusion it is possible to solve in two ways; for it is possible both by demolishing one of the premisses asked, and by showing that the conclusion is not the real state of the case: those, on the other hand, that are false in respect of their premisses can be solved only by a demolition of one of them; for the conclusion is true. So that those who wish to solve an argument should in the first place look and see if it is properly reasoned, or is unreasoned; and next, whether the conclusion be true or false, in order that we may effect the solution either by drawing some distinction or by demolishing something, and demolishing it either in this way or in that, as was laid down before.² There is a very great deal of difference between solving an argument when being subjected to questions and when not: for to foresee traps is difficult, whereas to see them at one's leisure is easier.

19 Of the refutations, then, that depend upon ambiguity and amphiboly some contain some question with more than one meaning, while others contain a conclusion bearing a number of senses: e. g. in the proof that 'speaking of the silent' is possible, the conclusion has a double meaning, while in the proof that 'he who knows does not understand what he knows' one of the questions contains an amphiboly. Also the double-edged saying is true in one context but

¹ Ch. 17.² 176^b 36-177^a 3.

15 not in another : it means something that is and something that is not.

Whenever, then, the many senses lie in the conclusion no refutation takes place unless the sophist secures as well the contradiction of the conclusion he means to prove ; e. g. in the proof that 'seeing of the blind' is possible : for without the contradiction there was no refutation. Whenever, on the other hand, the many senses lie in the questions, there is no necessity to begin by denying the double-edged premiss : for this was not the goal of the argument but
 20 only its support. At the start, then, one should reply with regard to an ambiguity, whether of a term or of a phrase, in this manner, that 'in one sense it is so, and in another not so', as e. g. that 'speaking of the silent' is in one sense possible but in another not possible : also that in one sense 'one should do what must needs be done', but not in another : for 'what must needs be' bears a number of senses. If, however, the ambiguity escapes one, one should
 25 correct it at the end by making an addition to the question : 'Is speaking of the silent possible?' 'No, but to speak of *A* while he is silent is possible.' Also, in cases which contain the ambiguity in their premisses, one should reply in like manner : 'Do people then not understand what they know?'¹ 'Yes, but not those who know it in the manner described' : for it is not the same thing to say that 'those who know cannot understand what they know', and to say that 'those who know something in this particular manner cannot do so'. In general, too, even though he
 30 draws his conclusion in a quite unambiguous manner, one should contend that what he has negated is not the fact which one has asserted but only its name ; and that therefore there is no refutation.

It is evident also how one should solve those refutations 20 that depend upon the division and combination of words : for if the expression means something different when
 35 divided and when combined, as soon as one's opponent draws his conclusion one should take the expression in the

¹ 177^a 28. Read ὅ τι ἐπιστάνται.

contrary way. All such expressions as the following depend upon the combination or division of the words: 'Was *X* being beaten with that with which you saw him being beaten?' and 'Did you see him being beaten with that with which he was being beaten?' This fallacy has also in it an element of amphiboly in the questions, but it 177^b really depends upon combination. For the meaning that depends upon the division of the words is not really a double meaning (for the expression when divided is not the same),¹ unless also the word that is pronounced, according to its breathing, as *ὄρος* and *ὅρος* is a case of double meaning. (In writing, indeed, a word is the same whenever it is written of the same letters and in the same manner 5—and even there people nowadays put marks at the side to show the pronunciation—but the spoken words are not the same.) Accordingly an expression that depends upon division is not an ambiguous one. It is evident also that not all refutations depend upon ambiguity as some people say they do.

The answerer, then, must divide the expression: for 'I- 10 saw-a-man-being-beaten with my eyes' is not the same as to say 'I saw a man being-beaten-with-my-eyes'. Also there is the argument of Euthydemus proving 'Then you know now in Sicily that there are triremes in Piraeus':² and again, 'Can a good man who is a cobbler be bad?' 'No.' 'But a good man may be a bad cobbler: therefore a good cobbler will be bad.' Again, 'Things the know- 15 ledge of which is good, are good things to learn, aren't they?' 'Yes.' 'The knowledge, however, of evil is good:³ therefore evil is a good thing to know.' 'Yes. But, you see, evil is both evil and a thing-to-learn, so that evil is an evil-thing-to-learn, although the knowledge of evils is good.' Again, 'Is it true to say in the present moment that you 20 are born?' 'Yes.' 'Then you are born in the present moment.' 'No; the expression as divided has a different

¹ 177^b 2 οὐ γὰρ . . . διαιρούμενος is parenthetic.

² 177^b 12-13. Read 'Ἀρ' οἶδας (12) and a colon instead of a question-mark after ἐν Σικελίᾳ δὲν.

³ 177^b 17 σπουδαῖον τὸ μάθημα probably a slip for σπουδαῖα ἡ ἐπιστήμη, which the argument requires. The translation assumes the latter.

meaning: for it is true to say-in-the-present-moment that "you are born", but not "You are born-in-the-present-moment". Again, 'Could you do what you can, and as you can?' 'Yes.' 'But when not harping, you have the power to harp: and therefore you could harp when not harping.'

25 'No: he has not the power to harp-while-not-harping; merely, when he is not doing it, he has the power to do it.'

Some people solve this last refutation in another way as well. For, they say, if he has granted that he can do anything in the way he can, still it does not follow that he can harp when not harping: for it has not been granted that he will do anything in every way in which he can; and
30 it is not the same thing 'to do a thing in the way he can' and 'to do it in every way in which he can'. But evidently they do not solve it properly: for of arguments that depend upon the same point the solution is the same, whereas this will not fit all cases of the kind nor yet all ways of putting the questions: it is valid against the questioner, but not against his argument.

35 Accentuation gives rise to no fallacious arguments, either 21 as written or as spoken, except perhaps some few that might be made up; e. g. the following argument. 'Is οὐ καταλύεις a house?' 'Yes.' 'Is then οὐ καταλύεις the
177^a negation of καταλύεις?' 'Yes.' 'But you said that οὐ καταλύεις is a house: therefore the house is a negation.' How one should solve this, is clear: for the word does not mean the same when spoken with an acuter and when spoken with a graver accent.

It is clear also how one must meet those fallacies that 22
5 depend on the identical expression of things that are not identical, seeing that we are in possession of the kinds of predications. For the one man, say, has granted, when asked, that a term denoting a substance does not belong as an attribute, while the other has shown that some attribute belongs which is in the Category of Relation or of Quantity, but is usually thought to denote a substance because of its expression; e. g. in the following argument: 'Is it possible to be doing and to have done the same thing at the same

time?' 'No.' 'But, you see, it is surely possible to be ¹⁰ seeing and to have seen the same thing at the same time, and in the same aspect.' Again, 'Is any mode of passivity a mode of activity?' 'No.' 'Then "he is cut", "he is burnt", "he is struck by some sensible object" are alike in expression and all denote some form of passivity, while again "to say", "to run", "to see" are like one another in expression: but, you see, "to see" is surely a form of being ¹⁵ struck by a sensible object; therefore it is at the same time a form of passivity and of activity.' Suppose, however, that in that case any one, after granting that it is not possible to do and to have done the same thing in the same time, were to say that it *is* possible to see and to have seen it, still he has not yet been refuted, suppose him to say that 'to see' is not a form of 'doing' (activity) but of 'passivity': for this question is required as well, though he is supposed by the listener to have already granted it, ²⁰ when he granted that 'to cut' is a form of present, and 'to have cut' a form of past, activity, and so on with the other things that have a like expression. For the listener adds the rest by himself, thinking the meaning to be alike: whereas really the meaning is not alike, though it appears to be so because of the expression. The same thing happens here as happens in cases of ambiguity: for in ²⁵ dealing with ambiguous expressions the tyro in argument supposes the sophist to have negated the fact which he (the tyro) affirmed, and not merely the name: whereas there still wants the question whether in using the ambiguous term he had a single meaning in view: for if he grants that that was so, the refutation will be effected.

Like the above are also the following arguments. It is asked if a man has lost what he once had and afterwards ³⁰ has not: for a man will no longer have ten dice even though he has only lost one die. No: rather it is that he has lost *what* he had before and has not now; but there is no necessity for him to have lost *as much* or *as many* things as he has not now. So then, he asks the questions as to *what* he has, and draws the conclusion as to the *whole number that* he has: for ten is a number. If then he had

asked to begin with, whether a man no longer having the
 35 number of things he once had has lost the whole number,
 no one would have granted it, but would have said 'Either
 the whole number or one of them'. Also there is the
 argument that 'a man may give what he has not got': for
 he has not got only one die. No: rather it is that he has
 given, not *what* he had not got, but *in a manner in which*
 he had not got it, viz. just the one. For the word 'only'
 178^b does not signify a particular substance or quality or number,
 but a *manner of relation*, e. g. that it is not coupled with
 any other. It is therefore just as if he had asked 'Could
 a man give what he has not got?' and, on being given the
 answer 'No', were to ask if a man could give a thing
 quickly when he had not got it quickly, and, on this being
 granted, were to conclude that 'a man could give what he
 had not got'. It is quite evident that he has not proved
 5 his point: for to 'give quickly' is not to give a thing, but
 to give in a certain manner; and a man could certainly give
 a thing in a manner in which he has not got it, e. g. he
 might have got it with pleasure and give it with pain.

Like these are also all arguments of the following kind:
 'Could a man strike a blow with a hand which he has not
 got, or see with an eye which he has not got?' For he has
 10 not got only one eye. Some people solve this case, where
 a man has more than one eye, or more than one of any-
 thing else, by saying also that he has only one. Others
 also solve it as they solve the refutation of the view that
 'what a man has, he has received': for *A* gave only one
 vote; and certainly *B*, they say, has only one vote from *A*.
 Others, again, proceed by demolishing straight away the
 proposition asked, and admitting that it is quite possible
 to have what one has not received; e. g. to have received
 15 sweet wine, but then, owing to its going bad in the course
 of receipt, to have it sour. But, as was said also above,¹
 all these persons direct their solutions against the man, not
 against his argument. For if this were a genuine solution,
 then, suppose any one to grant the opposite, he could find
 no solution, just as happens in other cases; e. g. suppose

¹ 177^b 31.

the true solution to be 'So-and-so is partly true and partly not',¹ then, if the answerer grants the expression without 20 any qualification, the sophist's conclusion follows. If, on the other hand, the conclusion does not follow, then that could not be the true solution: and what we say in regard to the foregoing examples is that, even if all the sophist's premisses be granted, still no proof is effected.

Moreover, the following too belong to this group of arguments. 'If something be in writing did some one write 25 it?' 'Yes.' 'But it is now in writing that you are seated—a false statement, though it was true at the time when it was written: therefore the statement that was written is at the same time false and true.' But this is fallacious, for the falsity or truth of a statement or opinion indicates not a substance but a quality: for the same account applies to the case of an opinion as well. Again, 'Is what a learner learns what he learns?' 'Yes.' 'But suppose some one 30 learns "slow" quick'. Then his (the sophist's) words denote not *what* the learner learns but *how* he learns it. Also, 'Does a man tread upon what he walks through?' 'Yes.' 'But *X* walks through a whole day.' No, rather the words denote not what he walks through, but *when* he walks; just as when any one uses the words 'to drink the cup' he denotes not what he drinks, but the vessel *out of which* he drinks. Also, 'Is it either by learning or by discovery that a man knows what he knows?' 'Yes.' 'But suppose that of a pair of things he has discovered one and 35 learned the other, the pair is not known to him by either method.' No: 'what' he knows, means 'every single thing' he knows, individually; but this does not² mean 'all the things' he knows, collectively. Again, there is the proof that there is a 'third man' distinct from Man and from individual men. But that is a fallacy, for 'Man', and indeed every general predicate, denotes not an individual substance, but a particular quality, or the being related to something in a particular manner³, or something of that sort. Likewise also in the case of 'Coriscus' and 'Coriscus the 179^a

¹ 178^b 19-20. Read αἶον εἰ 'ἔστι μὲν ὁ, ἔστι δ' ὁ οὐ' ἡ λύσις (sc. ἐστι).

² 178^b 36. Read τὸ δ' οὐχ ἀπαντα. ³ 178^a 38-9. Read ἡ πρὸς τί πως.

musician' there is the problem, 'Are they the same or different?' For the one denotes an individual substance and the other a quality, so that it cannot be isolated; though it is not the isolation which creates the 'third man', but the admission that it is an individual substance. For 'Man' cannot be an individual substance, as Callias is.¹ Nor is the case improved one whit even if one were to call the element he has isolated not an individual substance but a quality: for there will still be the one beside the many, just as 'Man' was. It is evident then that one must not grant that what is a common predicate applying to a class universally is an individual substance, but must say that it denotes either a quality, or a relation, or a quantity, or something of that kind.

It is a general rule in dealing with arguments that depend on language that the solution always follows the opposite of the point on which the argument turns: e.g. if the argument depends upon combination, then the solution consists in division; if upon division, then in combination. Again, if it depends on an acute accent, the solution is a grave accent; if on a grave accent, it is an acute. If it depends on ambiguity, one can solve it by using the opposite term; e.g. if you find yourself calling something inanimate,² despite your previous denial that it was so, show in what sense it is alive: if, on the other hand, one has declared it to be inanimate and the sophist has proved it to be animate, say how it is inanimate. Likewise also in a case of amphiboly. If the argument depends on likeness of expression, the opposite will be the solution. 'Could a man give what he has not got?' 'No, not *what* he has not got; but he could give it *in a way in which* he has not got it, e.g. one die by itself.' Does a man know either by learning or by discovery each *thing* that he knows, singly? 'Yes, but not the *things* that he knows, collectively.' Also a man treads, perhaps, on any *thing* he walks through, but not on the *time* he walks through. Likewise also in the case of the other examples.

¹ 179^a 5. Read a comma after Καλλίας.

² 179^a 17. Read ἀψυχον for ἐμψυχον.

24 In dealing with arguments that depend on Accident, one and the same solution meets all cases. For since it is indeterminate when an attribute should be ascribed to a thing, in cases where it belongs to the accident of the thing, and since in some cases it is generally agreed and people admit that it belongs, while in others they deny that it need belong, we should therefore, as soon as the conclusion has 30 been drawn,¹ say in answer to them all alike, that there is no need for such an attribute to belong. One must, however, be prepared to adduce an example of the kind of attribute meant. All arguments such as the following depend upon Accident. 'Do you know what I am going to ask you?' 'Do you know the man who is approaching', or 'the man in the mask'? 'Is the statue your work of art?' or 'Is the dog your father?'² 'Is the product of a 35 small number with a small number a small number?' For it is evident in all these cases that there is no necessity for the attribute which is true of the thing's accident to be true of the thing as well. For only to things that are indistinguishable and one in essence it is generally agreed that all the same attributes belong; whereas in the case of a good thing, to be good is not the same as to be going to be the subject of a question; nor in the case of a man 179^b approaching, or wearing a mask, is 'to be approaching' the same thing as 'to be Coriscus', so that suppose I know Coriscus, but do not know the man who is approaching, it still isn't the case that I both know and do not know the same man; nor, again, if this is mine and is also a work of art, is it therefore my work of art, but my property or thing; or something else. (The solution is after the same manner in the other cases as well.)

Some solve these refutations by demolishing the original proposition asked: for they say that it is possible to know and not to know the same thing, only not in the same respect: accordingly, when they don't know the man who is coming towards them, but do know Coriscus, they assert that they do know and don't know the same object, but not 10

¹ 179^a 30. Read συμβιβασθέντος.

² Cf. Pl. *Euthyd.* 298 E.

in the same respect. Yet, as we have already remarked,¹ the correction of arguments that depend upon the same point ought to be the same, whereas this one will not stand if one adopts the same principle in regard not to knowing something, but to being, or to being in a certain state, e. g. 15 suppose that *X* is a father, and is also yours: for if in some cases this is true and it is possible to know and not to know the same thing, yet with that case the solution stated has nothing to do. Certainly there is nothing² to prevent the same argument from having a number of flaws; but it is not the exposition of any and every fault that constitutes a solution: for it is possible for a man to show that a false conclusion has been proved, but not to show on what it depends, e. g. in the case of Zeno's argument to prove that motion is 20 impossible. So that even if any one were to try to establish that this doctrine is an impossible one, he still is mistaken, and even if he proved his case ten thousand times over, still this is no³ solution of Zeno's argument: for the solution was all along an exposition of false reasoning, showing on what its falsity depends. If then he has not proved his case, or is trying to establish even a true proposition, or a false 25 one, in a false manner,⁴ to point this out is a true solution. Possibly, indeed, the present suggestion may very well apply in some cases: but in these cases, at any rate, not even this would be generally agreed: for he knows both that Coriscus is Coriscus and that the approaching figure is approaching. To know and not to know the same thing is generally thought to be possible, when e. g. one knows that 30 *X* is white, but does not realize that he is musical: for in that way he does know and not know the same thing, though not in the same respect. But as to the approaching figure and Coriscus he knows both that it is approaching and that he is Coriscus.

A like mistake to that of those whom we have mentioned is that of those who solve the proof that every number is

¹ 177^b 31.² 179^b 17. Read οὐδὲν δῆ.³ 179^b 22. Omitting εἰ, and reading ἀλλ' οὐκ ἔστιν, with a comma after συλλελογισμένος.⁴ 179^b 24-5. Read ἡ καὶ ἀληθὲς ἢ ψεῦδος (ψεῦδως) ἐπιχειρεῖ συνάγειν.

a small number: for if, when the conclusion is not proved, 35 they pass this over and say that a conclusion has been proved and is true, on the ground that every number is both great and small, they make a mistake.

Some people also use the principle of ambiguity to solve the aforesaid reasonings, e.g. the proof that '*X* is your father', or 'son', or 'slave'. Yet it is evident that if the appearance of a proof depends upon a plurality of mean- 180^a ings, the term, or the expression in question, ought to bear a number of literal senses, whereas no one speaks of *A* as being '*B*'s child' in the literal sense, if *B* is the child's master, but the combination depends upon Accident. 'Is *A* yours?' 'Yes.' 'And is *A* a child?' 'Yes.' 'Then 5 the child *A* is yours,'¹ because he happens to be both yours and a child; but he is not 'your child'.

There is also the proof that 'something "of evils" is good'; for wisdom is a 'knowledge "of evils"'. But the expression that this is 'of so-and-so' (= 'so-and-so's') has not a number of meanings: it means that it is 'so-and-so's 10 property'. We may suppose of course, on the other hand, that it has a number of meanings—for we also say that man is 'of the animals', though not their property; and also that any term related to 'evils' in a way expressed by a genitive case is on that account a so-and-so 'of evils', though it is not one of the evils²—but in that case the apparently different meanings seem to depend on whether the term is used relatively or absolutely. 'Yet it is conceivably possible to find a real ambiguity in the phrase "Something of evils is good".' Perhaps, but not with 15 regard to the phrase in question. It would occur more nearly, suppose that 'A servant is good of the wicked'; though perhaps it is not quite found even there: for a thing may be 'good' and be '*X*'s' without being at the same time '*X*'s good'. Nor is the saying that 'Man is of the animals' a phrase with a number of meanings: for a phrase does not become possessed of a number of meanings merely suppose 20 we express it elliptically: for we express 'Give me the

¹ 180^a 5. Read σὺν ἡρὰ τοῦτο τὸ τέκνον.

² Extend the parenthesis to after the second κακῶν in l. 13.

Iliad' by quoting half a line of it, e. g. 'Give me "Sing, goddess, of the wrath . . ."'

Those arguments which depend upon an expression that 25
is valid of a particular thing, or in a particular respect, or
place, or manner, or relation, and not valid absolutely,
should be solved by considering the conclusion in relation
25 to its contradictory, to see if any of these things can possibly
have happened to it. For it is impossible for contraries
and opposites and an affirmative and a negative to belong
to the same thing absolutely; there is, however, nothing to
prevent each from belonging in a particular respect or rela-
tion or manner, or to prevent one of them from belonging
in a particular respect and the other absolutely. So that if
this one belongs absolutely and that one in a particular
30 respect, there is as yet no refutation. This is a feature one
has to find in the conclusion by examining it in comparison
with its contradictory.

All arguments of the following kind have this feature:
'Is it possible for what is-not to be?' 'No.' 'But, you
see, it *is* something, despite its not *being*.'¹ Likewise also,
Being will not be; for it will *not be* some particular form of
35 being. 'Is it possible for the same man at the same time to
be a keeper and a breaker of his oath?' 'Can the same
man at the same time both obey and disobey the same
man?' Or isn't it the case that being something in particu-
lar and Being are not the same? On the other hand, Not-
being, even if it be something, need not also have absolute
'being' as well. Nor if a man keeps his oath in this
particular instance or in this particular respect, is he bound
also to be a keeper of oaths absolutely, but he who swears
180^b that he will break his oath, and then breaks it, keeps this
particular oath only; he is not a keeper of his oath: nor is
the disobedient man 'obedient', though he obeys one
particular command. The argument is similar, also, as
regards the problem whether the same man can at the same
time say what is both false and true: but it appears to be
a troublesome question because it is not easy to see in which

¹ Cf. 167^a 1 *supra*.

of the two connexions the word 'absolutely' is to be rendered '—with 'true' or with 'false'. There is, however, 5 nothing to prevent it from being false absolutely, though true in some particular respect or relation, i. e. being true in some things, though not 'true' absolutely. Likewise also in cases of some particular relation and place and time. For all arguments of the following kind depend upon this. 'Is health, or wealth, a good thing?' 'Yes.' 'But to the fool who does not use it aright it is not a good thing: therefore 10 it is both good and not good.' 'Is health, or political power, a good thing?' 'Yes.' 'But sometimes it is not particularly good: therefore the same thing is both good and not good to the same man.' Or rather there is nothing to prevent a thing, though good absolutely, being not good to a particular man, or being good to a particular man, and yet not good now or here. 'Is that which the prudent man 15 would not wish, an evil?' 'Yes.' 'But to get rid of, he would not wish the good: therefore the good is an evil.' But that is a mistake; for it is not the same thing to say 'The good is an evil' and 'to get rid of the good is an evil'. Likewise also the argument of the thief is mistaken. For it is not the case that if the thief is an evil thing, acquiring things is also evil: what he wishes, therefore, is not what is evil but what is good; for to acquire something 20 good is good. Also, disease is an evil thing, but not to get rid of disease. 'Is the just preferable to the unjust, and what takes place justly to what takes place unjustly?' 'Yes.' 'But to be put to death unjustly is preferable.' 'Is it just that each should have his own?' 'Yes.' 'But whatever decisions a man comes to on the strength of his personal opinion, even if it be a false opinion,² are valid in 25 law: therefore the same result is both just and unjust.' Also, 'should one decide in favour of him who says what is just, or of him who says what is unjust?'³ 'The former.' 'But, you see, it is just for the injured party also to say fully the things he has suffered; and these were unjust.'

¹ 180^b 4. Read a comma after ἀπλῶς. ² 180^b 25. Read ψευδής.

³ Or read τὰ ἀδίκᾳ νικᾶν in 180^b 27 = 'should one judge him . . . or him . . . to be the winner?' (cf. l. 38).

But these are fallacies. For because to suffer a thing unjustly is preferable, unjust ways are not therefore preferable to just; but, absolutely, just ways are preferable, though in this particular case the unjust may very well be better than the just. Also, to have one's own is just, while to have what is another's is not just: all the same, the decision in question may very well be a just decision, whatever it be that the opinion of the man who gave the decision supports: for because it is just in this particular case or in this particular manner, it is not also just absolutely. Likewise also, though things are unjust, there is nothing to prevent the *speaking* of them being just: for because to speak of things is just, there is no necessity that the things should be just, any more than because to speak of things be of use, the things need be of use. Likewise also in the case of what is just. So that it is not the case that because the things spoken of are unjust, the victory goes to him who speaks unjust things: for he speaks of things that are just to speak of, though absolutely, i. e. to suffer, they are unjust.

181^a Refutations that depend on the definition of a refutation must, according to the plan sketched above,¹ be met by comparing together the conclusion with its contradictory, and seeing that it shall involve the same attribute in the same respect and relation and manner and time. If this additional question be put at the start, you should not admit that it is impossible for the same thing to be both double and not double, but grant that it is possible, only not in such a way as was agreed to constitute a refutation of your case. All the following arguments depend upon a point of that kind. 'Does a man who knows *A* to be *A*, know the thing called *A*?' and in the same way, 'is one who is ignorant that *A* is *A* ignorant of the thing called *A*?' 10 'Yes.' 'But one who knows that Coriscus is Coriscus might be ignorant of the fact that he is musical, so that he both knows and is ignorant of the same thing.' 'Is a thing four cubits long greater than a thing three cubits long?'

¹ 167^a 21.

'Yes.' 'But a thing might grow from three to four cubits in length;' now what is 'greater' is greater than a 'less': accordingly the thing in question will be both greater and less than itself in the same respect.¹

27 As to refutations that depend on begging and assuming 15 the original point to be proved, suppose the nature of the question to be obvious,² one should not grant it, even though it be a view generally held, but should tell him the truth. Suppose, however, that it escapes one, then, thanks to the badness of arguments of that kind, one should make one's error recoil upon the questioner, and say that he has brought no argument: for a refutation must be proved independently of the original point. Secondly, one should say that the point was granted under the impression that he intended not to use it as a premiss, but to reason against it,³ 20 in the opposite way from that adopted in refutations on side issues.

28 Also, those refutations that bring one to their conclusion through the consequent you should show up in the course of the argument itself. The mode in which consequences follow is two-fold. For the argument either is that as the universal follows on its particular—as (e.g.) 'animal' follows from 'man'—so does the particular on its universal: for the claim is made that if *A* is always found 25 with *B*, then *B* also is always found with *A*. Or else it proceeds by way of the opposites of the terms involved: for if *A* follows *B*, it is claimed that *A*'s opposite will follow *B*'s opposite. On this latter claim the argument of Melissus also depends: for he claims that because that which has come to be has a beginning, that which has not come to be has none, so that if the heaven has not come to be, it is also eternal. But that is not so; for the sequence is vice versa. 30

29 In the case of any refutations whose reasoning depends on some addition, look and see if upon its subtraction the

¹ 181^a 14. Read κατὰ ταῦτόν after αὐτοῦ.

² 181^a 16. Read πυνθανομένην, ἂν μὲν ᾗ δῆλον, —

³ 181^a 21. Read a comma after συλλογισιουμένου, not after τούναντίον.

absurdity follows none the less: and then if so, the answerer should point this out, and say that he granted the addition not because he really thought it, but for the sake of the argument, whereas the questioner has not used it for the
 35 purpose of his argument at all.

To meet those refutations which make several questions 30 into one, one should draw a distinction between them straight away at the start. For a question must be single to which there is a single answer, so that one must not affirm or deny several things of one thing, nor one thing of many, but one of one. But just as in the case of ambiguous terms, an attribute belongs to a term sometimes
 181^b in both its senses, and sometimes in neither, so that a simple answer does one, as it happens, no harm despite the fact that the question is not simple, so it is in these cases of double questions too. Whenever, then, the several attributes belong to the one subject, or the one to the many,
 5 the man who gives a simple answer encounters no obstacle even though he has committed this mistake: but whenever an attribute belongs to one subject but not to the other, or there is a question of a number of attributes belonging to a number of subjects and in one sense both belong to both, while in another sense, again, they do not, then there is trouble, so that one must beware of this. Thus (e. g.) in the following arguments: Supposing *A* to
 10 be good and *B* evil, you will, if you give a single answer about both, be compelled to say that it is true to call these good, and that it is true to call them evil and likewise to call them neither good nor evil (for each of them has not each character), so that the same thing will be both good and evil and neither good nor evil. Also, since everything is the same as itself and different from anything else,¹ inasmuch as² the man who answers double questions simply can be made to say that several things are 'the same' not as other things but 'as themselves,' and also that they are different from themselves, it follows that the same things must

¹ 181^b 13. Read a comma after *ἐτερον*.

² 181^b 14. Read *ἐνιδὴ* for *ἐνεί* δ'.

be both the same as and different from themselves.¹ More-¹⁵
 over, if what is good becomes evil while what is evil is
 good,² then they must both become two. So of two unequal
 things each being equal to itself, it will follow that they are
 both equal and unequal to themselves.

Now these refutations fall into the province of other
 solutions as well: for 'both' and 'all' have more than one²⁰
 meaning, so that the resulting affirmation and denial of the
 same thing does not occur, except verbally: and this is not
 what we meant by a refutation. But it is clear that if there
 be not put a single question on a number of points, but the
 answerer has affirmed or denied one attribute only of one
 subject only, the absurdity will not come to pass.

- 31 With regard to those who draw one into repeating the²⁵
 same thing³ a number of times, it is clear that one must not
 grant that predications of relative terms have any meaning
 in abstraction by themselves, e. g. that 'double' is a signifi-
 cant term apart from the whole phrase 'double of half'
 merely on the ground that it figures in it. For ten figures
 in 'ten minus one' and 'do' in 'not do', and generally the³⁰
 affirmation in the negation; but for all that, suppose any
 one were to say, 'This is not white', he does not say that it
 is white. The bare word 'double', one may perhaps say,
 has not even any meaning at all, any more than has 'the' in
 'the half': and even if it has a meaning, yet it has not the
 same meaning as in the combination. Nor is 'knowledge'
 the same thing in a specific branch of it (suppose it, e. g., to
 be 'medical knowledge') as it is in general: for in general³⁵
 it was the 'knowledge of the knowable'. In the case of
 terms that are predicated of the terms through which they
 are defined, you should say the same thing,⁴ that the term
 defined is not the same in abstraction as it is in the whole
 phrase. For 'concave' has a general meaning which is the

¹ 181^b 14-15 ἕτερα αὐτῶν . . . ἐαυτοῖς ἕτερα. The Greek idiom must
 here be kept, to bring about the contradiction: the English idiom
 'different from *one another*' avoids it.

² 181^b 15-16 εἰ τὸ μὲν . . . ἀγαθὸν ἐστιν, sc. as happens if you answer
 a double question about them together simply.

³ 181^b 25 Read εἰς (τῷ) τὸ αὐτό.

⁴ 181^b 36 Read ταὐτὸ for τοῦτο.

same in the case of a snub nose, and of a bandy leg, but when added to either substantive nothing prevents it from differentiating its meaning; in fact it bears one sense¹ as
 182^a applied to the nose, and another as applied to the leg: for in the former connexion it means 'snub' and in the latter bandy-shaped'; i.e. it makes no difference whether you say 'a snub nose' or 'a concave nose'. Moreover, the expression must not be granted in the nominative case: for it is a falsehood. For snubness is not a concave nose but something (e.g. an affection) belonging to a nose: hence,
 5 there is no absurdity in supposing that the snub nose is a nose possessing the concavity that belongs to a nose.

With regard to solecisms, we have previously said² what 32
 it is that appears to bring them about; the method of their solution will be clear in the course of the arguments themselves. Solecism is the result aimed at in all arguments of
 10 the following kind: 'Is a thing truly that which you truly call it?' 'Yes.' 'But, speaking of a stone, you call him real³: therefore of a stone it follows that "him is real"'. No: rather, talking of a stone means not saying 'which' but 'whom', and not 'that' but 'him'. If, then, any one were to ask, 'Is a stone *him whom* you truly call him?' he would be generally thought not to be speaking good Greek, any more than if he were to ask, 'Is *he* what you call *her*?' Speak in
 15 this way⁴ of a 'stick' or any neuter word, and the difference does not break out. For this reason, also, no solecism is incurred, suppose any one asks, 'Is a thing what you say it to be?' 'Yes.' 'But, speaking of a stick, you call it real: therefore, of a stick it follows that it is real.' 'Stone', however, and 'he' have masculine designations. Now suppose some one were to ask, 'Can "he" be a "she" (a female)?', and then again, 'Well, but is not he Coriscus?'

¹ 182^a 1 Read *σημαίνει*.

² 165^b 20f.

³ 182^a 11. 'Stone' (*λίθος*) being masculine in Greek. It has been necessary to deal rather freely with this passage, because 'stone' is not inflected in English. Literally, the Greek says, 'You declare something to be a stone (acc.): something therefore is a stone' (still acc., though the change to *oratio recta* requires a change to the nom.).

⁴ 182^a 15 Read *εἰπὲν οὕτως*.

DE SOPHISTICIS ELENCHIS

'you understand *that*, not *of that*, of which you have understanding', so that you understand not 'of a stone', but 'the stone'.

Thus that arguments of this kind do not prove solecism but merely appear to do so, and both why they so appear
5 and how you should meet them, is clear from what has been said.

We must also observe that of all the arguments aforesaid 33
it is easier with some to see why and where the reasoning leads the hearer astray, while with others it is more difficult, though often they are the same arguments as the former. For we must call an argument the same if it depends upon the same point; but the same argument is apt to be thought
10 by some to depend on diction, by others on accident, and by others on something else, because each of them, when worked with different terms, is not so clear as it was. Accordingly, just as in fallacies that depend on ambiguity, which are generally thought to be the silliest form of
15 fallacy, some are clear even to the man in the street (for humorous phrases nearly all depend on diction; e. g. 'The man got the cart down from the stand'¹; and 'Where are you bound?' 'To the yard arm'; and 'Which cow will calve afore?' 'Neither, but both behind;' and 'Is the North wind clear?' 'No, indeed; for it has murdered the
20 beggar and the merchant.' 'Is he a Goodenough-King?' 'No, indeed; a Rob-son': and so with the great majority of the rest as well),² while others appear to elude the most expert³ (and it is a symptom of this that they often fight about their terms, e. g. whether the meaning of 'Being' and 'One' is the same in all their applications or different;
25 for some think that 'Being' and 'One' mean the same;

¹ An obscure joke: the phrase *φέρεισθαι κατὰ κλίμακος δίφρον* probably contains a double pun, (1) to get the body of a car (*δίφρος*) taken off its chassis (*κλίμαξ* = the notched support on top of the axle, on which the car rested), (2) to 'come a sitter' (*δίφρος* = a seat) off a ladder (*κλίμαξ*).

² 182^b 22 Close the bracket, and read a comma instead of a full-stop after *πλείστοι*.

³ 182^b 22 *σημείων* . . . 27 *τὸ ὅν* is parenthetic (like 15 *καὶ γὰρ*—22 *πλείστοι*), and should be likewise enclosed in brackets, followed by a comma, the colon after *λανθάνειν* (l. 22) being removed.

while others solve the argument of Zeno and Parmenides by asserting that 'One' and 'Being' are used in a number of senses), likewise also as regards fallacies of Accident and each of the other types, some of the arguments will be easier to see while others are more difficult; also to grasp to which class a fallacy belongs, and whether it is a refutation or not a refutation, is not equally easy in all cases.

An incisive argument is one which produces the greatest perplexity: for this is the one with the sharpest fang. Now perplexity is two-fold, one which occurs in reasoned arguments, respecting which of the propositions asked one is to demolish, and the other in contentious arguments, respecting the manner in which one is to assent to what is propounded. Therefore it is in syllogistic arguments that the more incisive ones produce the keenest heart-searching. Now a syllogistic argument is most incisive if from premisses that are as generally accepted as possible it demolishes a conclusion that is accepted as generally as possible. For the one argument, if the contradictory is changed about, makes all the resulting syllogisms alike in character: for always from premisses that are generally accepted it will prove a conclusion, negative or positive as the case may be, that is just as generally accepted; and therefore one is bound to feel perplexed.¹ An argument, then, of this kind is the most incisive, viz. the one that puts its conclusion on all fours with the propositions asked; and second comes the one that argues from premisses, all of which are equally convincing: for this will produce an equal perplexity as to what kind of premiss, of those asked, one should demolish.

¹ 182^b 37-183^a 2. The nature of the syllogisms which produce this most 'incisive' and perplexing form of argument by 'changing about the contradictory' (of the first conclusion established) may be illustrated by Pacius' example. Suppose the thesis maintained to be the exceedingly probable view that 'Medea did not love her children', the dialectician then argues

I. All mothers love their children (exceedingly probable).

Medea was a mother (exceedingly probable).

∴ Medea loved her children (just as probable as, but utterly subversive of, the exceedingly probable thesis).

Next, he constructs two syllogisms in which the contradictory of this conclusion (i. e. the original, and exceedingly probable, thesis) is

Herein is a difficulty: for one must demolish something, but what one must demolish is uncertain. Of contentious arguments, on the other hand, the most incisive is the one which, in the first place, is characterized by an initial uncertainty whether it has been properly reasoned or not; and also whether the solution depends on a false premiss or on the drawing of a distinction; while, of the rest, the
 10 second place is held by that whose solution clearly depends upon a distinction or a demolition, and yet it does not reveal clearly which it is of the premisses asked, whose demolition, or the drawing of a distinction within it, will bring the solution about, but even leaves it vague whether it is on the conclusion or on one of the premisses that the deception¹ depends.

Now sometimes an argument which has not been properly
 15 reasoned is silly, supposing the assumptions required to be extremely contrary to the general view or false; but sometimes it ought not to be held in contempt. For whenever some question is left out, of the kind that concerns both the subject and the nerve of the argument, the reasoning that has both failed to secure this as well, and also failed to reason properly, is silly; but when what is omitted is some extraneous question, then it is by no means to be lightly
 20 despised, but the argument is quite respectable, though the questioner has not put his questions well.

Just as it is possible to bring a solution sometimes used in a changed position with each of the two original premisses in turn, to subvert the other: thus—

II. All mothers love their children (exceedingly probable).

Medea did not love her children (exceedingly probable).

∴ Medea was not a mother (just as probable as, but subversive of, the exceedingly probable *minor* premiss of Syllogism I).

III. Medea did not love her children (exceedingly probable).

Medea was a mother (exceedingly probable).

∴ Some mothers do not love their children (as probable as, but subversive of, the exceedingly probable *major* premiss of Syllogism I).

All three syllogisms are 'alike', in that each overthrows an exceedingly probable view by means of a conclusion based on exceedingly probable premisses, and therefore itself exceedingly probable. Together they produce the maximum of perplexity because, as a result, of each of three exceedingly probable propositions the contradictory has also been shown to be exceedingly probable.

¹ 183^a 12 Read ἡ ἀνάγκη for αὐτή (v. Pseudo-Alexander).

against the argument, at others against the questioner and his mode of questioning, and at others against neither of these, likewise also it is possible to marshal one's questions and reasoning both against the thesis, and against the answerer and against the time, whenever the solution ²⁵ requires a longer time to examine than the period available.¹

- 34 As to the number, then, and kind of sources whence fallacies arise in discussion, and how we are to show that our opponent is committing a fallacy and make him utter paradoxes ; moreover, by the use of what materials solecism is brought about, and how to question and what is the way ³⁰ to arrange the questions ; moreover, as to the question what use is served by all arguments of this kind, and concerning the answerer's part, both as a whole in general, and in particular how to solve arguments and solecisms²—on all these things let the foregoing discussion suffice. It remains to recall our original proposal and to bring our ³⁵ discussion to a close with a few words upon it.

Our programme was, then, to discover some faculty of reasoning about any theme put before us from the most generally accepted premisses that there are. For that is the essential task of the art of discussion (dialectic) and of examination (peirastic). Inasmuch, however, as it is ^{183^b} annexed to it, on account of the near presence of the art of sophistry (sophistic), not only to be able to conduct an examination dialectically but also with a show of knowledge, we therefore proposed for our treatise not only the aforesaid aim of being able to exact an account of any view, but also the aim of ensuring that in standing ⁵ up to an argument we shall defend our thesis in the same manner by means of views as generally held as possible. The reason of this we have explained ;³ for this, too, was why Socrates used to ask questions and not to answer them ; for he used to confess that he did not know.

¹ 183^a 26 Omit τὸ διαλεχθῆναι πρὸς τὴν λύσιν—clearly a marginal gloss on ἡ λύσις (25).

² 183^a 30 συλλογισμός, 33 σιλλογισμούς: Read σολοικισμός and σολοικισμούς (cf. 165^b 19, 20).

³ 165^a 19-27.

We have made clear, in the course of what precedes, the number both of the points with reference to which, and of the materials from which, this will be accomplished, and
10 also from what sources we can become well supplied with these: we have shown, moreover, how to question or arrange the questioning as a whole, and the problems concerning the answers and solutions to be used against the reasonings of the questioner. We have also cleared up the problems concerning all other matters that belong to the same inquiry into arguments. In addition to this we have
15 been through the subject of Fallacies, as we have already stated above.¹

That our programme, then, has been adequately completed is clear. But we must not omit to notice what has happened in regard to this inquiry. For in the case of all discoveries the results of previous labours that have been handed down from others have been advanced bit by bit by those who have taken them on, whereas the original
20 discoveries generally make an advance that is small at first though much more useful than the development which later springs out of them. For it may be that in everything, as the saying is, 'the first start is the main part': and for this reason also it is the most difficult; for in proportion as it is most potent in its influence, so it is smallest in
25 its compass and therefore most difficult to see: whereas when this is once discovered, it is easier to add and develop the remainder in connexion with it. This is in fact what has happened in regard to rhetorical speeches and to practically all the other arts: for those who discovered the beginnings of them advanced them in all only a little way,
30 whereas the celebrities of to-day are the heirs (so to speak) of a long succession of men who have advanced them bit by bit, and so have developed them to their present form, Tisias coming next after the first founders, then Thrasymachus after Tisias, and Theodorus next to him, while several people have made their several contributions to it: and therefore it is not to be wondered at that the art has attained considerable dimensions. Of this inquiry, on the other

¹ 183^a 27.

hand, it was not the case that part of the work had been 35
thoroughly done before, while part had not. Nothing
existed at all. For the training given by the paid pro-
fessors of contentious arguments was like the treatment of
the matter by Gorgias. For they used to hand out speeches
to be learned by heart, some rhetorical, others in the form
of question and answer, each side supposing that their
arguments on either side generally fall among them. And 184^a
therefore the teaching they gave their pupils was ready but
rough. For they used to suppose that they trained people
by imparting to them not the art but its products, as though
any one professing that he would impart a form of know-
ledge to obviate any pain in the feet, were then not to 5
teach a man the art of shoe-making or the sources whence
he can acquire anything of the kind, but were to present
him with several kinds of shoes of all sorts: for he has
helped him to meet his need, but has not imparted an art
to him. Moreover, on the subject of Rhetoric there exists
much that has been said long ago, whereas on the subject 184^b
of reasoning we had nothing else of an earlier date to speak
of at all, but were kept at work for a long time in experi-
mental researches. If, then, it seems to you after inspec-
tion that, such being the situation as it existed at the start,
our investigation is in a satisfactory condition compared
with the other inquiries that have been developed by tradi- 5
tion, there must remain for all of you, or for our students,
the task of extending us your pardon for the shortcomings
of the inquiry, and for the discoveries thereof your warm
thanks.

INDEX

Absolute attributes: to belong 'absolutely' def., 115^b 29-35.

A. belongs absolutely, if in greater or less degrees, 115^b 3; not vice versa, 115^a 32-3, ^b 8-10; or if in a certain respect, time or place, 115^b 11: objections to positive use of this principle, 115^b 14, 17, 19, 26; reply to some of them, 115^b 24, 27.

Good 'absolutely' better than good 'for X', 116^b 8 (cf. ^a 21-2): if A is better absolutely than B, best ex. of A is better than best ex. of B, and vice versa, 117^b 33. That A is absolutely good or desirable or objectionable can be shown by same argts. which show it to be more so than B, 119^a 2-9. Absolute predication of Properties, 134^a 32, 135^a 2.

Fallacy of Absolute and qualified use of expression (*dictum simpliciter* and *secundum quid*), one of 7 fallacious refutations not dependent on diction, 166^b 22-3: illustrated, 166^b 37-167^a 20: its solution, *Soph. El.*, ch. 25; a form of *ign. elenchi*, 168^b 11-16: why deceptive, 169^b 10-12.

Accent (*προσῳδία*), *Fallacy of*: one of 6 fallacious refutations dependent on diction, 165^b 27; illustrated, 166^b 1-9: its solution, *Soph. El.*, ch. 21 and 179^a 14-15; a form of *ign. elenchi*, 168^a 27 foll.: why deceptive, 169^a 27-29. (Cf. *Breathings*.)

Accident: 101^b 18, 25: def. negatively, 102^b 4, and (better) affirmatively, 102^b 6-14.

Commonplace tests of accident: Bk. II *passim*.

Comparisons of things based on accidents, 102^b 14: commonplace tests of, Bk. III *passim*.

Tests of a, alone apply to all other predicables, 155^a 11-12. Tests common to genus and a., 120^b 15-17, 124^b 7-8 (from con-

tradictories), 125^b 10 and 126^a 14 (from consideration of subjects wherein S and P inhere): to property and a., 129^a 32-4, 133^a 32-4: to definition and a., 102^b 27, 139^a 36-^b 3.

A. may = temporary or relative property, 102^b 21 (cf. 129^a 32-4), but never = property absolutely, 102^b 25: cf. 131^a 27-37, ^b 5-18. No a. of X can be X's genus, 120^b 21, 30-35; or differentia, 144^a 23-7.

A., as test of sameness, 152^a 33-7.

(essential attribute (*καθ' αὐτό*), 110^b 21 foll., 116^a 31-3, ^b 2-7, 143^a 3-4, 149^b 9, 13, 170^a 4.

Universal affirmation of a. easier to disprove than to prove, 154^b 33; particular do., easier to prove than to disprove, 154^b 36: proof of a. the easiest task in dialectic, 155^a 28-31; disproof of do. very difficult, 155^a 31-36.

A., alone of predicables, may belong in part only, and ∴ admit only precariously of conversion (i. e. of transition from 'P belongs to S' to 'S is P'), 109^a 10-26. Sophistical difficulty whether an attribute of S belongs to S qualified by some a., 133^b 15-24, 31-36 (cf. 178^b 39-179^a 1). If both variable, S and its a. should vary together, 115^a 4-6.

Immortality an accident (*συμπῳμα*) of life, 126^b 36, 39.

Fallacy of Accident: one of 7 fallacious refutations not dependent on diction, 166^b 22: illustrated, 166^b 28-36: its solution, *Soph. El.*, ch. 24; why deceptive, 169^b 3-6: a form of *ign. elenchi*, 168^a 34-^b 5, 169^a 3-4. Usual fallacy whereby amateurs entrap scientists, 168^b 6-10. Fallacy of Consequent, a branch of F. of A., 168^b 27 foll.

Achilles: 117^b 14-15, 24: 166^a 38.

INDEX

Activity (1) = ποιεῖν a category
X passivity, 103^b 23

Capacity for a and p not a property of Being, 139^a 4 8; nor its defn, 146^a 22-3, 31-2, 148^a 18-21.

Movement rather a form of a or p. in soul than the soul's genus, 120^b 26-7

Verbal terminations proper to a)(those proper to passivity or quality, their confusion a source of fallacy of 'form of expression', 166^b 13-8, 178^a 11-24

(2) = ἐνεργεία: considered as genus of 'building', 124^a 21, of 'using', 124^a 33 genus of 'motion', 125^b 17, of 'memory', 125^b 19.)(State (ἐξίς), 125^b 15 Regarded (like γενεσις) as aiming at further end, in which it ceases, contr 'pleasure', regarded as an a. which is also an end in itself, 146^b 13-19 'Kissing a 'physical activity', 106^b 2-3.

Affection (πάθος) cannot have as its genus the thing affected (το περὶ οὗτος), 126^b 34-127^a 2, nor yet its subject, S (οὐ ἐστὶ τ-αὐτίς), 127^a 3, unless the affection can be called 'an S', 127^a 9 19

Must be inherent in the thing whose affection it is, 145^a 35^b 11. = an accident (συμπτωμα), 126^b 36, 39

Agamemnon, his dream, 166^b 6-7

Air not its property to be 'breathable', for (1) this, though true of particular portions of air, is not true of the air as a whole, 135^a 33-^b 1: (2) it is merely potential and presupposes an animal capable of breathing, which may not exist, 138^b 30-37

Not the genus of 'wind', 127^a 4 'Full of air')('empty', 152^b 19-24,

Windlessness: air = calm. sea, 108^a 11-12, ^b 24-6.

Ajax, more like Achilles, and . a better man, than Odysseus, 117^b 13, 16, 24

Alteration (ἀλλαιωσις), a species of 'motion', 121^a 32 pleasure not an a, ib.

Ambiguity, inevitable because

things infinite, names finite, in no, 165^a 6-13 Importance of detecting, 108^a 18 foll. rules for, Bk 1, ch 15

As source of tests of accidents, 110^a 23-^b 15 To be avoided in rendering Genus, 123^a 27-29, 33-7, 127^b 5-7, in rendering a Property correctly (καλῶς), 129^b 30 foll, or its subject, 130^a 15 foll, in Definition, 139^b 19 foll, 148^a 23^b 23 One of most general and effective tests, 154^a 18, 20. A of term (ὄνομα), as opp a. of whole phrase (ὁλος ὁ λόγος), 129^a 30-2 [Cf 110^b 16-17 and see *Amphiboly*]

Fallacy of Ambiguity, one of 6 fallacious refutations dependent on diction, 165^b 26 illustrated, 165^b 30-166^a 6, 14-21 rules for its solution, Soph 11, ch 19 and 179^a 15-19 why deceptive, 169^a 22-5 Not all sophistical refutations depend on ambiguity, 177^b 7 9 (cf 179^b 38-160^a 7), only amphiboly and fallacy of 'form of expression', 168^a 23-5, resemblance between fallacies of 1 and form of expression, 178^a 24-28 Depends on latent 'double question', 175^b 39-41, 176^a 14-15 Silhest type of fallacy, 182^b 13-14 humorous exx of, 182^b 15-21

A in questions renders even genuine refutation disputable, 175^a 40-^b 14, 28-30 leads into paradox, 175^b 33-7

Ambiguous terms (v. esp Bk 1, ch 15) 'same', 103^a 7, 25-39, 169^a 25 'good', 106^a 4, 107^a 5 foll 'sharp', 106^a 13, 32, 107^a 13, ^b 14, 23 βαρυ, 106^a 18, 'fire' (καλον), 106^a 20, 'clear' (λευκον) and 'obscure' (μελαν), of sounds and colours, 106^a 25, ^b 5, 107^a 12, ^b 14, 35, 'dull' (ἄμβλυς), 106^a 32. 'pleasure', 106^a 37 to 'love' (φιλεῖν), 106^b 2-4. 'see' (βλεπεῖν), 106^b 15. 'have sense' (αἰσθινασθαι), 106^b 23, cf 129^b 33-4. 'just', 106^b 29; 'healthy', 106^b 34, cf 107^b 8-12: 'donkey' (ὄνος), 107^a 19, 29 to be 'commensurably related to health' (συμ-

INDEX

μέτρως ἔχειν πρὸς ὑγίειαν), 107^b 8: 'colour', 107^b 28: 'desirable' (αἰρετόν), 118^b 27: 'passage into...' (ἀγωγή εἰς...), 139^b 21: 'balance' (συμμετρίαν), 139^b 21: 'unsupplantable' (ἀμετάπτωτος), 'nurse' (τιθήνη), 'harmony' (συμφωνίαν), 139^b 33: 'life' (in plants and animals), 148^a 23 foll. (esp. 27 foll.): what 'needs to be' (ἀνυγκαιόν, δέον), 165^b 35-8; αἰετός and κύων, 166^a 16: 'Being' and 'One', 169^a 24, 170^b 21-2 (but cf. 182^b 24-7).

Ambitious *μῆτις*: def. = 'one who strives for honour' inadequate, 146^b 23.

Amphiboly: as test of Accident, 110^b 16-111^a 7 (no technical name used: described as an ambiguity μὴ καθ' ὁμολογίαν, ἀλλὰ κατ' ἄλλον τρόπον). To be avoided in rendering Property, 129^b 30 (again no technical name: described as ambiguity of 'the whole phrase'). 111^a, 'the science of many things is one', 110^b 17: 'immune at present from destruction' (described as ἀμφιβολία), 145^b 24.

Fallacy of Amphiboly: one of 6 fallacious refutations dependent on diction, 165^b 26: illustrated, 166^a 6-23: its solution, Soph. El., ch. 19 and 179^a 15-20: really depends on 'ambiguity', 168^a 23-5, 175^a 36-8: on concealed 'double question', 175^b 39-41: renders even genuine refutation disputable, 175^a 41-8, 28-30.

Analytics, the (*Πρῶτη*), 162^a 11 (II. 2); 162^b 32 (II. 16): (*Ποστέριον*), 153^a 11 n. (II. 3-13); 153^a 24 n. (II. 13); 165^b 9.

Anger (ὀργή): def. = 'desire for vengeance on account of an apparent slight', 156^a 32: not def. = 'pain + consciousness of being slighted', 151^a 15-16 (relation being causal and not expressible by +): not a kind of pain, 125^b 29, 126^a 6-12; but the effect of pain, 125^b 33-4: 'pain' and 'conception of a slight' seem to have equal

claims to be the genus of a., 127^b 30: situated in the 'spirited faculty', 113^a 36: not followed by hatred, 113^a 35-3. To make answer angry by appearing unscrupulous, a good trick in contentious argument, 174^a 20-3 'Good temper' not def. = 'control of a.', 125^b 21-7.

Animal: its properties (1) to 'have sensation' (αἰσθησθαι ἔχειν), 129^b 26-9: (2) to be 'naturally sentient' (τὸ αἰσθανέσθαι πεφουκός), 133^a 8-11, cf. 137^b 23-7: (contr., 129^b 33-5, where disallowed as improperly expressed because of ambiguity of αἰσθανέσθαι = (a) αἰσθῆσαι ἔχειν (b) αἰσθῆσαι χρῆσθαι: but not disqualified as a property in former sense): (3) 'sensation' (τὸ αἰσθάνεσθαι), belongs to it because it has species which partake of its nature (τῷ μετεχέσθαι), 134^b 1, 138^a 28. *Not a property* of it (1) actively to 'perceive' (αἰσθάνεσθαι = αἰσθῆσαι χρῆσθαι of 129^b 34), 138^a 6-8: (2) to be 'a substance of which man is a species' (because virtually circular, and .'. uninformative), 131^a 4-6: (3) 'sometimes to move and sometimes to stand still' (because not permanent), 131^a 35-7, 133^b 3-4, 144^b 33-145^a 1: (4) to be 'sensible' (αἰσθητόν) or 'divisible' (μεριστόν), 138^a 23-5.

A. not a kind of 'perceptible' or 'visible thing', 126^a 22-5: its body only a part of a., 126^a 26-9. Anything of which a. is predicable is 'an animal', 109^a 14-17: all animals either species of a., or individual animals, 144^b 2-3. No common type of life in a. and plant, 148^a 29-31. A. always take nutriment, but do not always grow, 111^b 25-6.

Its differentiae: 'walking biped', 'flying biped', 107^a 26-7, 111^a 26, 133^b 7-11 (cf. ^a 1-5), 143^b 1-2, 144^b 16-18, 22-4: 'quadruped', 111^a 26: 'land-' and 'aquatic', 143^b 2, 144^b 36-145^a 1. ('Walking' a quality, not a kind, of a., 128^a 25-9.)

INDEX

A the genus of 'ox', 102^a 39, 144^a 34; of 'bird' and 'raven', 107^a 21 foll.; of 'man', 102^a 34-5, 38 (cf. 101^b 29-34), 144^a 34 more familiar than 'man', 141^b 29-34: not a property of man, 136^a 19 foll., 137^a 23 foll cannot be differentia of anything, 143^a 32: a substance, 103^b 30-1. 'A. that walks on 2 feet' the defn. of 'man', 103^a 26-7 (cf. 101^b 29-34): the addition 'six-feet high' inadmissible, 140^b 23-6. 'Flying biped a.' the defn. of 'bird', 107^a 26-7. 'Idea' of a (*αὐτὰ ζῶον*), 143^b 31.

Answerer his role)(questioner's role, in dialectic, 159^a 18-24: in contentious reasoning, 159^a 30-32. Rules how to answer, in dialectic, Bk VIII, chh 5-10; in contentious reasoning, Soph. El, chh. 16-32 [v. *Solution*]. May be required to cite objection, 157^a 35, 160^b 1 [v. *Objection*], to bring counter-argument (*ἀντιπαρατίθεσθαι*), see 160^b 5, 10, to furnish a division, if he refuses the one offered, 158^a 22-4. May ask for explanation of ambiguous phrase, 160^a 18-22: or distinguish its meanings for himself, 160^a 26-8. To assent without such distinctions a mistake, 175^b 28-33, 38-9; though answerers shy of drawing them, for fear of seeming obstructive, 175^b 33-6. Must answer 'Yes' or 'No' to clear question, 160^a 33-4 (cf. 158^a 15-17).

A. may be to blame for degeneration of argument into contentiousness, 161^a 17 foll., or for *petitio principii*, or self-contradiction of questioner, 161^b 11-17. A. and questioner, partners in a common task, 161^a 37-9.

Answers prescribed (in contentious argument) to suggest merely apparent solutions, 176^a 23 foll.

Perplexity (*ἀπορία*) of a two-fold—in reasoned arguments, which proposition is to be de-

molished, 182^b 33-4; in contentious arguments, how to grant the point asked, 182^b 34.

Antiphon, his method of squaring the circle, 172^a 7.

Antisthenes, his paradox that contradiction is impossible, 104^b 21.

ἄξιωματα merely = 'admissions claimed' as premisses, 156^a 23, 159^a 4, 160^a 7, ^b 29.

(*Apollonides*), 182^b 20.

Aporeme, defined, 162^a 17.

Arithmetic (*ἀριθμοί*), 153^a 10, 163^b 24.

Arrangement (*τάξις*) of argument: importance of, in dialectic, Bk. VIII, ch. 1, in contentious argument, 174^a 13. Rules of, in dialectic, Bk VIII, chh. 1-2; in contentious argument, Soph. El, ch 15.

Astonishment (*ἐκπληξις*), usually def = 'excessive wonderment', 126^b 17 not 'excess of wonderment', 126^b 14-33.

Athenians, 176^b 1-2.

Babbling (*ἰδολεσχεῖν*) def = 'being constrained to say the same thing a no. of times', 165^b 16.

Results from repeating (1) same term in a formula, 130^a 34 (2) same question in a discussion, 158^a 28. (3) from replacement of words by their definitions, 130^a 38: also in dealing (4) with relative terms, 173^b 1-5 (5) with any term whose defn. mentions the substance of which it is the state, affection etc, 173^b 5-11. Apparent)(real b, 173^b 12-16.

To entrap into b, a principal aim of contentious reasoners, 165^b 15. methods employed, Soph. El, ch 13: how avoided, Soph. El, ch. 31.

Bad (1) = *κακόν*, 115^b 5-7: see *Evil*.

(2) = *φᾶλος*, 109^b 38. Bad)(reasonable (*ἐπιεικής*) disposition, 113^a 13.

To do harm to friends, or good to enemies, the mark of a b. disposition, 113^a 9-16.

B knowledge)(good (*σπουδαια*), 111^a 23.

INDEX

Badness (φνυλότης) depends on choice (προαίρεσις), not on capacity (δυνάμις), 126^a 36.

Bad temper (δυσκολία) def., 160^b 11-13 how shown in argument, 156^b 34, 160^b 2-3, 161^a 17 foll.; forces questioner to do best he can, 161^b 9-10. [Cf. *Anger*]

Balance (συμμετρία): must be inherent in things whose b it is, 125^a 35-37, 145^b 9-10. 'Health' not well def. = 'b. of hot and cold elements' for (1) 'b.' is ambiguous, 139^b 21; (2) health is not inherent in hot and cold elements, 145^b 7-10.

Bandy leg (δουκόν), 181^b 38.

Beautiful (καλόν): syn. 'becoming' (πρέπον), 102^a 6, 135^a 13 statement that 'the becoming is beautiful' said to be 'definitory', 102^a 5. To be 'becoming', not its property, since identical, 135^a 12-14. Not def. = 'what is pleasing to the eyes or to the ears', 146^a 22-31.

Neither genus nor species of 'white', 128^a 3-4.

Beauty (κάλλος) valued only for appearance (δόξα), and not so desirable as health, 118^b 20-21. Genuine and sham b., 164^b 20.

Becoming (1) 'generation', 'coming-to-be' (γενεσις), a species of motion, 111^b 7; not def. = a 'passage into being' (ἡγώγη εἰς οὐσίαν), for 'passage' is ambiguous, 139^b 20. Modes of b., as tests of predications of Accident, 114^b 16-24, 119^b 8-15, of comparative values of things, 117^b 3-9; of Genus, 124^a 20-30; of Property, 137^a 21-^b 2, of Sameness, 151^b 36-152^a 4.

(2) πρέπον. v. *Beautiful*

Being ambiguous and difficult to divide, 169^a 24, 170^b 21-2 (but cf. 182^b 24-7): to be 'capable of being acted on or of acting', a property of B., 139^a 4-8; but B. not definable so, 146^a 22-3, 31-2; esp. by a Platonist, 148^a 18-21. A universal predicate, 121^a 17, ^b 7, 127^a 27, 33; has no genus, 121^a 16-19; commensurate with 'Unity' (τὸ εἷν) and ∴ neither

genus nor species of it, 121^b 7-8. generally thought to belong in highest degree to substance or what is one with substance, 169^a 35.

'Object of opinion' (δοξασιόν) not a species of being, 121^a 21-5; but taken as basis of sophistical proof that what is not, is, 167^a 1-6, 180^a 32-4, 36-8. Melissus' view that 'B. is one' a 'thesis' (paradox), 104^b 23. Tests of predications of Property derived from interchange of verbs 'to be', 'to become', 'to be destroyed', with both S and P, 137^a 21 foll.

Bekker, 149^a 29 n.

Bird species of 'animal', genus of 'raven', 107^a 23: 'flying biped animal' its definition, 107^a 26-7; 'flying biped' its property, 133^b 7-11 (if text be kept, but see n ad loc.).

Black (1) a species of colour, 123^b 26 its differentia, that it 'compresses the vision' (συγκριτικὸν ὁψείας), 153^a 1, cf. 107^b 29-30: b and 'white' are contraries, 105^b 36, 119^a 27-8; between which all other colours are intermediate (μεταξύ), 123^b 27: 'grey' an intermediate, 106^b 6.

(2) Applied to sounds = 'obscure', 106^a 25, ^b 6-7: its contrary = 'clear' (λευκός): but no intermediate, unless perh. 'harsh' (σομφός), 106^b 7-8.

Blind def. = 'not having sight when it would naturally have it' (negative defn., but permissible, because inevitable), 143^b 34.

Blindness def. = 'privation of sight in the eye', 147^b 34-5: cf. 109^b 22, 114^a 10, 124^a 38: a species of 'insensibility', 124^b 6: its property 'not to see, inasmuch as we have not got our natural sight', 136^a 2-4.

Body: not ambiguous, 130^a 10: not well defined = 'that which has 3 dimensions' (genus being omitted), 142^b 24. 'To be coloured', allowed to be its property, belonging to it derivatively (ὡς κατ' ἄλλο), because it

INDEX

possesses a surface, 134^b 10 13, but elsewhere denied to be, because (1) an attribute of 'surface' as well, 134^a 22-5, (2) what is 'more' or 'less a body' is not more or less coloured, 137^b 18-20; (3) whether the property of 'surface' or not, it cannot in either case be that of 'body', 138^a 15-19 Lmpedocles' doctrine of 4 elements of bodies, 105^b 17 Of bodies, fire the readiest to move upwards in space, 130^a 13, the most rarefied and lightest, 130^b 29-31 light consists of most rarefied particles, 146^a 16-17 earth specifically the heaviest, 132^b 31-3 B cannot mingle with what is incorporeal, 149^b 1-2

The body less good and important than the soul, 118^a 32-3. to be 'fitted to obey' (υπηρετικόν) a relative property of it (rel to the 'soul'), 128^b 18-19 B not the genus of 'animal', being only a part, 126^a 28-9 to be 'compounded of soul and b' a permanent property of a 'living creature', 129^a 2, 131^a 8, 137^b 13 Bodily (spiritual sense and want of sense, 106^b 23-8, bodily) (spiritual virtue and vice, 153^b 10 those in a sound state of b., the standard of what is absolutely healthy, 142^a 11.

Bone not well defined = 'the composition of fire, earth, and air', 151^a 23-31 (cf *Flesh*)

Breathing (πρσφθια), 177^b 3 (Cf *Accent*.)

Bryson, his method of squaring the circle, 171^b 16, 172^a 4

Buider not his property to 'produce a house', 137^b 1 B production of house = doctor: production of health, 136^b 35

Building, a kind of activity, 124^a 21.

Bywater, I, 174^b 27 n.

Callias, 176^a 1, 7, 179^a 5.

Callicles, 173^a 8

Calliope, 173^b 30.

Capacity (δυναμς), considered as kind of 'disposition' (διαθεσις),

124^a 32. Not the genus (1) of the state (εἶσις) which it accompanies, 125^b 20 (2) of any blameworthy or objectionable act, 126^a 30 foll (3) of anything intrinsically precious or desirable, 126^b 4-6 Always desirable, 126^a 37 (cf, however, 119^b 25), but only as means to something else (δι' ἄλλο), 126^b 5-6

As test of genus, 124^a 31-3; of property, 138^b 27-139^a 8

Distinction of c) (state as source of test for predication of Genus, 125^b 20-7

'Sensation' (αἰσθησις) not always a c., 119^b 1-2. 'Self-control' (ἐγκρατεία) a c rather than a virtue, 128^a 8

Carpentry, 116^a 18.

Carriage (φορα) (1) a kind of 'locomotion' (κατα τοπιν κίνησις), viz involuntarily ('walking' (βαδισις), 122^b 32-5, 123^a 3-5 Plato's def of 'locomotion' = 'carriage' criticized, 122^b 26.

(2) same word (φορα) in wider sense = 'locomotion' (q v), 142^b 3 (φορα ηλίου ὑπεργης)

Categories ten distinguished, 103^b 21 as sources of tests of ambiguity, 107^a 3-17, of Genus, 120^b 36-121^a 9, 122^a 3-19, 126^b 17, 124^b 15-22, 128^a 13-19 (cf 125^b 15-19), of Differentia, 126^a 20-9, of Property, 132^a 10 foll (requires S first to be placed in its essence by mention of its genus), 132^b 35 foll (forbids rendering of any essential attribute as property), of Sameness, 152^a 38-9 as source of solution of fallacy of Form of expression, 178^a 4 foll.

Diff meanings of 'good', illustrated in different c., 107^a 5-11; argts to be developed on each, 105^b 13.

Choerilus, 157^a 16

Clearness in argument (τὸ σαφέστερον εἶναι τὸν λόγον) one of the aims of non-necessary premisses, 155^b 23: how secured, 157^a 14-17: of three kinds, 162^a 35-2.

INDEX

Cleon, 182^a 32.
Cleophon, 174^b 27.
Cloud not def. = a 'condensation of the air', 146^b 29.
Coal (= live coal, ἀνθράξ), a species of 'fire', 134^b 28-29: to 'burn', not its property, 138^b 18-20.
Colour, ambiguous (1) of bodies, (2) of tunes, 107^b 28-32: genus, not accident, of 'white', 109^a 36, 123^b 26; also genus of 'black', 123^b 26; and of all intermediate colours, 123^b 27. Its differentiae (as applied to bodies) = 'sight-piercing' (διακριτικὸν ὀψέως, cf. 119^a 30, 153^a 38) and 'sight-compressing' (συγκριτικὸν ὀψέως, cf. 153^b 1), 107^b 29-30. Not a kind of 'compressing' (συγκριτικόν), 123^a 2.
Combination (συνθεσις), *Fallacy of*: one of 6 fallacious refutations dependent on diction, 165^b 26: illustrated, 166^a 23-32: why deceptive, 169^a 25-7: its solution, *Soph. El.*, ch. 20 and 179^a 12-13: a form of *ign. elenchi*, 168^a 26 foll.
Composition (σύνθεσις): contrary of 'decomposition' (διάλυσις), 151^a 28: '(compound' (συνθετον), or 'whole' (ὅλον), 151^a 20-31.
Compound (σύνθετον), rule for definition of, 148^b 33 foll. [cf. *Composition*].
Concave (κοίλον), general t. applied to snub-nose and hand-leg, 181^b 38 foll.
Concealment of intended conclusion (κρύψις τοῦ συμπεριεργαστος), an aim of non-necessary premisses, 155^b 23; contentious motive, 155^b 26. Rules for obtaining, in dialectic, 150^a 157^a 5; in contentious argument, *Soph. El.*, ch. 15.
Conception (ὑπόληψις): genus of 'knowledge', 114^a 18, 114^b 3, 125^a 9-11, cf. 130^b 15, 131^a 23, 146^b 2: not = kn., 149^a 10. Not genus of 'conviction' (πίστις), 125^b 29, 35-126^a 2: though def. of 'conviction' = 'vehement conception' (ὑπόληψις οὐκ ὀδυνηρὰ) usually accepted, 126^b 18.

Consequences (τὰ ἀποδοχὰ, εἰρησώματα, 117^a 5 foll.): as tests of predication of Accident, 117^b 17-23, 112^a 16-23; for distinguishing values otherwise indistinguishable, 117^a 5-15; as tests of definition, 145^b 11-20, and 150^a 22-18 (definition of X as 'the product of A+B'—τὸ ἐκ τούτων).

Prior / later c. [πρότερον] (ὑπέρτερον ἐπίμενα), 117^a 11.

Consequent, Fallacy of: one of 7 fallacious refutations not dependent on diction, 166^b 25: analysed and illustrated, 167^b 1-20: its solution, *Soph. El.*, ch. 28: why deceptive, 169^b 6-7: a form of *ign. elenchi*, 168^b 27-169^a 5. A branch of fallacy of Accident, 168^b 27-8, 169^b 6-7: its distinctive feature, always to require more than one subject, 168^b 28 foll.

Contact (αφή); the genus, not a species, of 'juncture' (συνσχῆ), 122^b 25-8.

Contentious (ἐριστικός) *Reasoning*: defined, 100^b 23, 165^b 7-8: effects only apparent refutation, 105^a 19-24, 175^a 33 foll.: those properly () (those improperly called 'reasoning', 101^a 1.

C. || *dialectical reasoning*, 108^a 33-7, 112^a 4-11, 161^a 33-4, 102^a 10 18, 171^b 6-7, 34-172^a 15 (so too 'refutations', 170^b 9-10). C. r. to be avoided, if possible, in dialectic, 108^a 29-37 (use of fallacy), 112^a 9-11 (apparent confutation on irrelevant side-issue), 161^a 33-4; but sometimes inevitable, 133^b 36-134^a 2, 155^b 26-8, 161^a 21-4. () dialectical way of bringing round an opponent, 162^a 33-4. () argument: dialectical do. = drawer of false diagrams: geometrician, 171^b 35-7; but with a difference, 171^b 38-172^a 7, 1-4. () *Examination - argument*, 160^b 23-9; (so too 'refutations', 170^b 10-11).

I || *Sophistical argument*, distinguished by motives of argueta, 171^b 25-34.

INDEX

5 aims of c. (sophistical) reasoners (Refutation, Fallacy, Paradox, Solecism, Babbling), Soph. El., ch. 3.

2 types of c. (sophistical) reasoning, 169^b 20-4, 171^b 8-10, 11 foll.

C. Refutation; its forms discovered by same method as forms of apparent reasoning, Soph. El., ch. 8; does not refute absolutely, but always relatively to answer, 170^a 12-19.

C. reasoning sometimes demands apparent rather than real solutions, 176^a 19 foll.: unscrupulous, 159^a 30-2, 171^b 24-5, 174^a 21-3: like a 'foul' (*ἀδίκια*) in a race or fight, 171^b 22-5, 174^a 22: c. tricks and rhetorical tricks, 174^b 19 foll.

How to put questions in c. reasoning, Soph. El., ch. 15: questioners less inclined than formerly to seek 'Yes' or 'No' answer, 175^b 8-10.

Most incisive (*δριμύτατος*) of c. argts., 183^a 7. Traditional teaching of c. argt. compared to Gorgias' teaching of rhetoric, 183^b 36 foll.

Contradictory terms (*κατ' ἀντίφασιν ἀντικείμενα*; *φάσις καὶ ἀπόφασις*), as sources of tests of ambiguity, 106^b 13-20; of Accident, 113^b 15-26; of Genus, 124^b 7-14; of Property, 136^a 5-^b 2.

Contrary terms (*ἐναντία*): as tests of ambiguity, 106^a 9-^b 12; of predications of Accident, 112^b 27-113^b 14, 113^b 27-114^a 6, 114^b 6-15, 119^a 37-^b 1; of comparative values of things, 117^b 4-7; of comparative estimates of any quality, 119^a 27-8; of predications of Genus, 123^b 1-124^a 9, 153^a 33-6; of Differentia, 153^a 36-^b 24; of Property, 135^b 8-16; of Definition, 140^a 18-20, 147^a 32-^b 25, 151^a 32-^b 2, 153^a 26, 29-31.

Terms with c.) (terms with none, 106^a 36. C. with intermediate terms, 106^b 4. C. in same thing (e g. rightness and wrongness in sensation), how

shown, 111^a 14 foll. C. cannot coexist in same subject, 113^a 22; but contr. Heraclitus (on good and evil), 159^b 30-3. Whatever subject admits one of a pair of c. must admit the other too, 113^a 34-5. C. subjects have c. attributes, 113^b 27 foll., and associations, 113^b 34 foll. C. have either same or c. genera, 153^a 35-6; have same differentiae (if genera be c.) or c. (if genus be same), 153^a 36-7, ^b 4-12, 17-18.

Knowledge of c. one, 105^b 5-6, 23, 110^b 20, 155^b 30-4, 156^b 11, 163^a 2-3, 164^a 1-2, 171^a 36-8.

If any statement generally accepted (and ∴ a fit premiss for dialectic), so will contradiction of its c. be, 104^a 13.

'Contrary' used loosely = 'opposite', 147^b 7, 10, 17, 20.

Contrary acts: Of the six combinations (*συνμπλοκαί*) possible between the acts formed by combination of 2 c. verbs and 2 c. objects, four produce c. acts, 112^b 27-8, 113^a 8-14, each of these acts having 2 contraries among the others, 113^a 14-18. Acts are c. if they treat same thing in c. ways (112^b 34, 113^a 9), or c. things in same way (112^b 36, 113^a 9), but not if they treat c. things in c. ways (112^b 31, 113^a 1).

Contumely (*προπηλακισμός*) not def. = 'insolence accompanied by jeering' (for j. is a species, not differentia, of insolence), 144^a 6.

Conventional language, breach with, a fault, 109^a 28: c. to be followed in regard to connotations, but not denotations, of terms, 110^a 14 foll., 148^b 20 foll.

Conversion (*ἀντιστρέφειν*) = (1) transition from 'P belongs to S' to 'S is P'; valid if P is definition, or genus, or property, but precarious if P is accident, of S, 109^a 10-26.

(2) *conversion by negation* (*ἢ κατὰ τὴν ἀντίφασιν ἀκολουθεῖς ἀνάπαλιν γνωμένη*), from 'A is B' to 'No not-B is A'; as

INDEX

- test of Accident, 113^b 15-26; applied to Genus, 124^b 7-14
- (3) *reductio per impossibile*, 163^a 32-6.
- Conviction** (πίστις) not a kind of 'conception' (νόλησις), 125^b 29, 35-126^a 2: not = 'vehementence of conception', 126^b 14-33: but definition = 'a vehement conception' passed as generally accepted, 126^b 17-18. Genus of 'knowledge', 128^a 35-7.
- Cooling**: def. = 'privation of heat', 141^a 12-13: not properly def. = 'privation of natural heat' ('natural' implied in 'privation'), 141^a 10-14.
- Co-ordinates** (σύντοιχα) of X, def. = (1) terms related to X as are 'just deeds' (or 'a just man') to justice, 114^a 27.
- (2) anything tending to produce or preserve X, 114^a 29
- (('inflections', 114^a 32, but often held to include them, 114^a 34.
- As tests of Accident, 114^a 26, 38 foll.; 119^a 38, 116-8, of Genus, 124^a 10-14; of Definitions, 147^a 21-2, 153^b 25-35; of Sameness, 151^b 28-33. Reckoned among most generally handy tests, 154^a 12-13. Putting question about co-ordinates of S, instead of about S direct, recommended as method of concealment in dialectic, 156^a 27 foll.
- Knowledge of c. one, 164^a 1-2
- Co-ordinates in a division** (ἀντιδιηρημένα): as tests of Property, 136^b 3-14; of Definition, 142^b 7 foll.; of Differential, 143^b 34 foll., 116, 35-144^a 4
- Coriscus**, 166^b 32, 173^b 31, 38, 175^b 19-23, 25, 176^a 7, 178^b 39, 179^a 1, 116-3, 9, 28, 32, 181^a 10, 182^a 20-1.
- Correct rendering** (τὸ καλῶς ἀποδιδόναι): of Properties, Bk. V, chh. 2-3: of Definitions, 139^a 34, 116, 12-141^a 24. Sources of incorrectness (1) obscurity (q.v.), 139^b 12, (2) redundancy (q.v.), 139^b 15.
- Courage**: not properly def. = (1) 'control of fears'; rather implies total immunity from fear 125^b 22-7: (2) 'daring+right reasoning' (no guarantee that the two are found in same circs. and relations), 151^a 3-13. Found in soul, 150^b 36.
- Is justice same as c., how determined, 151^b 31-3: justice not def. = temperance and courage, 150^a 3. Good intrinsically (contr. means of health), 106^a 4 foll. (cf. 107^a 5-8): more desirable in youth than in age, 117^a 30 less desirable than justice and temperance, 117^a 36, 38, than justice, 118^a 17, 36: goodness of c. transcends evil of false opinion, 150^b 4-5. 'Courageous', syn. 'strong at heart' (εὐψυχος), 112^a 33.
- Covetous man** (φιλοχρήματος), not def. = 'one who strives for money' (for quantity of money should be stated), 146^b 25.
- Day** def. = 'passage of the sun over the earth', 142^b 3.
- Deafness** not its property to be a 'lack of sensation', 135^b 31-2.
- Debility** (καχεξία): contrary of 'vigour', 113^b 35-6, 157^b 18-20, 23. follows on disease, 113^b 36: less evil than disease, 157^b 20.
- Decomposition** (διάλυσις); contrary of 'composition' (σύνθεσις), 151^a 28. Considered as kind of destruction (φθορά), 121^a 23-4, 28-9: but contr. 153^b 31, where φθορά is suggested as kind of decomposition (διάλυσις οίσις).
- Defect** (ἔνδειξις): contrary of 'excess' (ἱπερβολή), in same genus (I vil), 123^b 28 'moderate amount' (τὸ μετρίον) intermediate between them, 123^b 29.
- Definition** (ὁρισμός, ὁρισμός): def. = an attribute peculiar (like Property), and essential (contr. Property), 101^b 19-21, 39: of term (ὄνομα) or of phrase (λόγος), 102^a 1: always consists of a phrase, 102^a 4, 148^b 36-149^a 4. Always same as definitum, 102^a 7-14; though what is same as definitum not always its d., 102^a

INDEX

14 Examination of likeness of things useful for d, 108^b 9, 19 foll Rules for d., Bk. VI, *passim*.

Must (1) consist of genus and differentia, 103^b 15, 139^a 28, 143^b 8-9, 19-20, 153^a 15-21, ^b 14-15, 154^a 26-7: (2) be true universally, 139^a 26-7, 140^b 21-3, 154^a 36-^b 1: (3) be peculiar, 101^b 19-21, 109^b 10, 139^a 31, ^b 3, 149^b 22-3, 154^b 1-3, 10-12, 155^a 20. (4) express essence, 101^b 21, 39, 139^a 33: (tests for this, 141^a 24 foll) 155^a 21: and whole essence, 153^a 16-17, 21-2, 154^a 29 (5) render appropriate genus, 139^a 29, ^b 3, 143^a 12, 155^a 20 viz. proximate (*εγγυρτω*) genus, 143^a 19: (6) add appropriate differentiae, 139^a 29: (tests for this, 143^a 29 foll.): must state them fully, 146^b 20 foll (7) make clear also d. of contrary term, 140^a 18-20 (8) not be circular, 142^a 34: cf. 147^b 12 foll., 20 foll.

D. more scientific (*ἐπιστημονικωτερον*), if rendered of posterior through prior terms, 141^b 16, but d. through terms more intelligible to A or B sometimes necessary *ad hominem*, 141^b 17 foll. 2 different d. of same essence impossible, 142^b 35, 153^a 21-2: treated as absurd, 141^a 31-2, 148^b 14, 151^a 33-4, ^b 16-17. One d. of 2 different essences also impossible, 154^a 10-11 treated as absurd, 153^b 24 'Equimembral d' def, 148^b 34.

Definition and other predicables

D. amenable to all tests for other predicables, 102^b 27 (cf. 155^a 7-10), though distinctions should be kept for clearness, 102^b 35. cf. Accident, 139^a 36-^b 3, cf. Genus, 102^b 27, 120^b 13, 139^b 3-5, 143^a 12-14; cf. Property, 120^b 13, 139^b 3-5, 154^b 18-23: esp. (1) no term must be repeated, 130^a 29-31, 140^b 27 foll. (2) no universal predicate must be used, 130^b 11-14, 140^a 24: (3) nothing superfluous must be added, 130^b 25-8,

139^b 15, 140^a 24 foll: (4) neither S nor any of its species must be mentioned, 130^b 38 foll, and cf. 142^a 34 foll

Tests for d. not all applicable to other predicables, 155^a 10 Of other predicables, Property most like d., 155^a 23: but d not to be rendered as property, 131^b 37 foll Of elements in d., Genus is principal mark of essence, 139^a 29 31.

Science of d. (*διδασκη*) a branch of speculative science (*θεωρητικη*), 141^a 8. exact account of d not the business of dialectic, 153^a 11-12, 24-5 D generally assumed by the sciences, not proved, 153^a 7, but dialectical proof possible, 153^a 13-22 D the only way to grasp the fundamentals in science, 156^a 33, ^b 1-4 (one of the principal uses of dialectic study, 101^a 36) Dialectician should collect d, esp of primary and recurrent concepts, 163^b 20. For lack of d., problems often prove intractable, in dialectics, 158^b 17, 24 foll, in maths., 158^b 29 foll.

Disproof of d the easiest of all tasks of dialectic, 155^a 3-10: proof of d., the hardest, 155^a 18-22 Both d and Property easier to disprove than to prove, and for like reasons.—

(1) disproof requires one conclusion only, proof requires many, 154^a 32-6, ^b 15-18.

(2) proof of either must be universal, whereas one neg instance disproves, 154^a 36-^b 10, 19-22

(3) proof of either requires that formula be shown to be not only universally true, but peculiar, 154^b 10-12, 22-3.

D. of terms used, as test of ambiguity, 106^a 3, 107^a 36-^b 12; of Accident, 109^b 30-110^a 9, 111^b 12-16, of comparative estimates of any quality, 119^a 29-31, of Genus, 120^b 30-5, 121^a 10-19, 122^a 7-9, ^b 7-11, of Property, 130^a 38, of Definition, 140^b 29 foll, 142^b 2-6, 146^a 33-5, 147^b 13-17.

INDEX

Definitory (ὁριστικός); applied (1) to elucidation of term by synonym, 102^a 5; (2) to every problem respecting sameness and difference, 102^a 6. (3) to any problem bearing on inquiry into definitions, 102^a 9. In a sense all inquiries on any predicable do this last, 102^b 27 foll. (cf. s.v. *Definition*), and are therefore definitory, 102^b 33: but better to distinguish d. problems)('generic' do. (γενικά), 102^b 35-103^a 4.

Demonstration def., 100^a 27: requires systematic deduction from principles appropriate to subject, 158^a 36-7. Every d. also a refutation, 170^a 24-6.)(Dialectic [q.v.], does not proceed by question and answer, 172^a 15-21.)(Examination argument held acc. to principles of dialectic, 172^a 21 foll., 39^b 1. Demonstrations, like sciences, perh. infinite in no., 170^a 22-3.

Desirable (ἀγαθόν): = (1) expedient, (2) honourable, (3) pleasant, 105^a 27, 118^b 27: contrary of 'objectionable' (φεικτόν), 113^a 12, ^b 33, 135^b 15. syn. 'proper object of pursuit' (διωκτόν), 133^a 28. A property of 'good', 135^b 15-16: but 'more desirable')('better', 118^a 8-15: the same thing may be equally desirable and objectionable, 118^b 37. relative to individual, 116^a 22, 118^a 11, cf. ^b 15.

Not a property of the d. to 'appear good to some people', 133^a 26-8. Intrinsically (δι' αὐτόν) d.)(d. for sake of something else (δι' ἄλλο, δι' ἕτερον), 116^a 29, 149^b 31 foll. (Tests for definition of former, 149^b 31-9.) Essentially (καθ' αὐτόν) d.)(d. accidentally (κατὰ συμβεβηκός), 116^a 31.

Rules for distinguishing desirable)(undesirable, and less)(more desirable, Bk. III chh. 1-4. Doing good to friends, and evil to enemies, both d., 113^a 2. 'Capacity' of any kind d., even of bad man, 126^a 36. 'Most desirable', used of 2

terms, does not imply their identity (unless each is an individual), but only that the one contains the other, 152^a 28-30.

Desire (ἐπιθυμία) def. = 'conation' (1) 'for pleasure', 146^b 11-12: (2) 'for what appears pleasant', 147^a 1-5. Said *not* to be def. = 'conation for the pleasant', 140^b 27 foll., though objection here not really well founded, 140^b 31-141^a 4: but cf. 146^b 11-12, 147^a 1-5. 'Sexual love' not 'desire for intercourse' (see *Lois* c). 'Desire of X' ambiguous, 110^b 37 foll.

Desire, faculty of (ἐπιθυμητικόν): the seat of 'friendship' (φιλία), 113^b 2: of pleasure and pain, 126^a 9-10. Incapable of knowledge, and ∴ of ignorance, 113^b 3-6. Its property, to be the 'primary seat of Temperance' (το πρῶτον σωφρον), 138^b 1-5: not its property, to 'desire' (ἐπιθυμεῖν), 138^a 34-5. A property of the soul to be the primary whole of which faculty of desire is part, 138^b 13-14.

Destruction (φθορά, φθειρισθαι): a species of 'motion' (κίνησις), 111^b 5-7.

Modes of d., as tests of predications of Accident, 114^b 16-24, 119^b 8-15; of comparative values of things, 117^b 3-5; of Genus, 124^a 20-30; of Property, 137^a 21-2, of Definition, 150^a 33-6, of Sameness, 152^a 1-4. D. and decomposition (v.

Decomposition).

Dialectic critical approach to common principles of all inquiries, 101^b 3: no definite kind of being for its province, 172^a 12: so of refutations, d. studies only those based on common principles, 170^a 38-9, i.e. such as are (1) really dialectical, (2) sophistical and only apparently dialectical, (3) suited to examination, 170^b 8-11. Uses of studying d., 101^a 25, 36; cf. 165^a 19-31, 175^a 5-16. D. comp. with rhetoric and medicine, 101^b 5. Divisions of D., v. Table of Contents. Problems how to

INDEX

arrange and put questions peculiar to d (contr. philosophy), 155^b 9.

Dialectical proposition and problem (s v. *Propositions and Problems*).

Dialectical Reasoning: def, 100^a 29, 165^b 3-4, = epichireme, 162^a 16. Inductive)(deductive, 105^a 10-19.

)(*Philosophy*, 105^b 30-1, 155^b 7-16, 162^a 15-16, 131-3, 175^a 31-3: but useful for philosophy, 101^a 34-^b 4, 155^b 7-8, 163^b 9-12, 175^a 5-12.

)(*Demonstration*, 162^a 15-16, 157^b 34 foll., 172^a 12-21.

)(*Teaching (Didactic)*, 159^a 11-14, 26 foll., 161^a 24-5, 165^b 1-4, 171^a 31-^b 2, 172^a 15-21

)(*Contentious reasoning (Eristic, Sophistic)*, see *Contentious Reasoning*.

D. r. and Examination-arguments, 159^a 25, 33, 161^a 25 distinguished, 165^b 3-6 Examination a branch of d, aimed at exposing ignorant pretender, 169^b 25-7, 171^b 4-6: cf 183^a 37-^b 1.

D. r. a mode of examination, 172^a 23-^b 1: everyone in a sense an examiner, 172^a 30-5 expert examiner (dialectician) differs in possessing technique of the syllogism, 172^a 35-6.

D. r. and Rhetoric, see *Rhetoric*.

Dialogue-form, arguments in 4 kinds (1) Didactic, (2) Dialectic, (3) Examination-arguments, (4) Contentious arguments, 165^a 38-9.

Didactic argument def. = 'those that reason from principles appropriate to each subject, and not from opinions held by answerer', 165^b 1-2: = demonstration, cf. together 165^a 39 and ^b 9-11. D.)(*dialectical reasoning*, see *Dialectical reasoning*

Differences of things to be observed, 105^a 24 and Bk. I, ch 16: importance of them, 108^a 38-^b 6

Differentia D. and species: D. belongs to essence of S., 108^b 4-

6, 133^a 1-3, 153^a 18, 154^a 27-8, (but contr 122^b 15-17 and cf 128^a 20): must . be appropriate (*idm*) to S., 143^a 30-1, a permanent attribute, 123^a 15-19, 145^a 11, not a property, 133^a 19, 21, not an accident, 144^a 23-7, not merely S.'s place or habitat, 144^b 31 Absolutely more intelligible than, and prior to, S., 141^b 27-34, 144^b 9-11 Commensurate with, or wider than, S, 122^b 39-123^a 1, 144^b 6 Identical terms have same d, 107^b 27-31, 152^b 3 'Specific' (*ειδονοιος*) d, 143^b 7-8

D and genus closely associated, 101^b 18: d. cannot be S.'s genus, nor vice versa, 122^b 12-15, 123^a 3-5, 126^b 13-33, 128^a 20-9, 144^a 9 foll. . nor genus of S's genus, 123^a 1, 6-10 A quality, not essential attribute, of genus, 128^a 26-8 (cf 122^b 16-17), 144^a 18, 20-2

Of narrower denotation than genus, 121^b 11-14, 123^a 6-10, 128^a 22 Less expressive than genus of essence of S, 128^a 23-6 Cannot be a species of S.'s genus, 107^b 33-4, 144^a 5-8 cf 122^b 20-4 Posterior to genus, 144^b 10 genus not a quality of d, 128^a 27-9 Must be one of a number of co-ordinates distinguished within S.'s genus, 143^a 34-^b 5 Different and non-subaltern genera must have different d., unless the genera be themselves in same higher genus, 107^b 19, 144^b 13-25

Must not be rendered negatively, 143^b 11 foll Must be rendered fully, 142^b 30, 146^b 20 (with full determinations of quantity, quality, manner, cause, &c.)

Of relative terms, d. must render correlate that is better rather than worse (143^a 9), natural (145^a 19-27) and primary (145^a 28-32). Of contraries, d. are contrary if in same genus, or same if in contrary genera, 153^a 37-^b 24.

Dionysius, 148^a 27

Disease a kind of evil, 123^b 17-18:

INDEX

brings debility (*καχεξία*), 113 36: a greater evil than debility 157^b 20: worse than ugliness (because greater hindrance to both pleasure and goodness) 118^b 35: contrary of 'health', with no intermediary, 123^b 17-18: but particular diseases (fever, ophthalmia, &c.) have no contrary, 123^b 34-7.

Disposition (*διάθεσις*), the genus of 'knowledge', 111^a 23, 121^b 38, 125^a 1, 145^a 36 (cf. *State*): of 'virtue', 121^b 38: considered as genus of 'capacity', 124^a 32. Must be inherent in the thing whose d. it is, 125^a 33-7, 145^a 33-^b 11. Knowledge a state and d. of the soul, 124^b 34, 145^a 36.

Division of terms (into species or individuals) recommended, 105^b 31-7: as test for Accident, 109^b 13-29, 111^a 33-^b 11, 120^a 34-^b 6; of Genus, 121^a 27-37; of Property, 132^a 27-^b 3: one of most general and effective tests, 154^a 17.

Fallacy of Division: one of 6 fallacious refutations dependent on diction, 165^b 26: illustrated, 166^a 33-8: why deceptive, 169^a 25-7: rules for its solution, *Soph. El.*, ch. 20 and 179^a 13-14: a form of *ign. elenchi*, 168^a 27 foll.

Doctor: his business to take all possible means to heal, 101^b 5-10: his views, the accepted standard in medicine, 104^a 33-7, 110^a 20-2: his property, to 'have ability to produce health', 137^a 3-7; not 'to produce health', 136^b 37. D.: production of health = builder: production of house, 136^b 35-7 D.: ability to produce health = trainer (*γυμναστής*): ability to produce vigour (*ἀνείξια*), 137^a 3-5. [Cf. *Medicine*.]

Donkey—ambiguous, 107^a 19, 29: bears inferior likeness to horse, 117^b 25-7.

Double (*διπλάσιον*): def. of d. through 'half' (its opposite) permissible, because inevitable, 142^a 27.

'Double of X' def. = 'that which exceeds X by an amount equal to X', 147^a 30.

A kind of 'multiple', 121^a 4-5; but only in ref. to same unit, 124^b 24-7:)('multiple', 152^b 15-16. Like 'multiple', a relative term, 121^a 3-5, 124^b 15-18: rel. to 'half', 124^b 24, 29, 135^b 19: possible exception to rule that genus and species are related to unequal no. of things, 125^a 18-24.

Its property, to be 'in proportion of $\frac{1}{2}$ ', 135^b 25; not its property 'to exceed' (*τὸ ὑπερέχον*), 135^b 20-1.

Dull (*ἀμβλύνει*), used (1) of edges, 106^a 13, 32: (2) of flavours, 106^a 32.

Earth: its properties (1) to be 'specifically heaviest body', 132^b 31-4: (2) 'naturally to fall downwards', 135^b 3-5 (cf. 130^b 1-2 for incorrect rendering of this). Not def. = a 'nurse', 139^b 33: not genus of 'mud', 127^a 14. 'Sun's movement over e.', 131^b 25-30, 142^b 1-6. 'Shadow on the e.' not adequate def. of 'night': 'movement of the e.', not adequate def. of 'earthquake', 146^b 28-30.

Empedocles, his doctrine that there are 4 physical elements, 105^b 16.

Empty, not = 'full of air', 152^b 19-24.

Epichireme, def., 162^a 16.

Equity (*ἐπιείκεια*), not def. = 'remission of what is expedient and just' (redundant), 141^a 16-19. 'Reasonable' (equitable disposition))('bad' one (*φαιλόν*), 113^a 13.

Ethiopian, the; 167^a 11.

(*Euarchus*), 182^b 20.

Euthydemus, 177^b 12: *E.*, the, 166^a 14 n., 179^a 35 n.

Even:)(odd, the differentiae of 'number', 120^b 3-6, 123^a 11-13, 142^b 9-10.

E. number not def. = 'a no. divisible into halves' (circular), 142^b 12. '2' (*ἡ δύος*) = 'the only prime no. among even nos.', 157^a 39.

Events occur (1) of necessity, (2)

INDEX

usually (ὡς ἐπὶ τὸ πολὺ), (3) by chance (ἀπότερα ἔτυχε), 112^b 1-2.

Evil (κακόν): opposite (ἀντικείμενον) of 'good', 119^a 36-^b 1: 'contrary' (ἐναντίον) of good, 105^b 36, 135^b 14-15: e. and good thing cannot be same, 152^b 1: Heraclitus' paradox that good and e. are same, 159^b 30-3 (cf. 163^a 16-17). Sophistical proof that same two things can be both good, and both e., and neither good nor e., 181^b 9-16 (cf. 180^b 9-21). Like 'good', a genus not referable to any higher genus, 123^b 8-12. Its property, to be 'objectionable' (φευκτόν), 135^b 14-16. Must not appear in rendering a property of 'good' (circular), 131^a 17-20; nor in definition of 'good', 142^a 23 (because opposite, and ∴ not prior, to g.), and 147^b 18-25 (because circular). The genus of 'disease', 123^b 17-18; of 'defect' and 'excess', 123^b 28.

That whose destruction is e. is itself good; that whose production is e. is itself e., 114^b 19-24. What destroys good, or produces e., is e. (and vice versa), 119^b 8 foll. What causes e. essentially (καθ' αὐτό) more objectionable than what causes it accidentally (κατὰ συμβεβηκός), 116^b 4-6: cause of less e., preferable to cause of more, 117^a 8-9: what is less connected with e., preferable, 117^b 31-2. Injustice an e., 115^a 1 (cf. 119^b 4); but not its property to be 'the worst', 135^b 10-12. If all (or some) pleasure be good, all (or some) pain is e., 119^a 39-^b 1. Any contrary of a good thing is e., 119^a 36 foll.; but principle that 'greater e. is contrary to greater good' amended by addition 'unless one good involves the other', 157^b 17-24. Whole formed by addition of good to e. not necessarily good, 115^b 1. Quality of products of things good, evil, and neutral, 150^a 36-^b 18.

Examination-argument: 159^a 25 foll.: rules how to answer in

such arguments, Bk. VIII, chh. 5-10.

)(*Teaching*, 159^a 33, 161^a 25.

)(*Scientific reasoning*: e. demands 'Yes' or 'No' answers, 171^b 3, cf. 172^a 15-17. Requires no scientific knowledge, but only general knowledge indispensable to student of science, 172^a 21-7; 39-^b 1: concerned only with common principles, 172^a 27-30: practised by all, 172^a 30-4.

(cf. *Dialectical Reasoning*).

)(*Contentious* or *Sophistical* argument, 159^a 25, 169^b 20-9: but possible to examine sophistically as well as dialectically, 183^b 1-3.

Eye primary seat of 'sight' and of 'blindness', 147^b 34-5 (cf. 29): not to be described in definition as 'brow-shaded' (unfamiliar), 140^a 4. Sight: eye = reason: soul, 106^a 11

Fallacy, Fallacious Argument, False Reasoning (cf. *Misreasonings*, and see *Soph. El.*, *passim*). Study of ambiguous terms valuable both for avoidance and for perpetration of f., 108^a 26-33; though deliberate perpetration of f. to be avoided where possible in dialectic, 108^a 33-7. 4 kinds of f. a., 162^b 3-15: 2 kinds of f. r., 176^b 31-3. F. a. a fault of arguer rather than of argument, 162^b 16. Difficulty of classifying f., in some cases, *Soph. El.*, ch. 33 *init.* One of principal aims of contentious reasoners, to entrap into f. (ψεῦδος), 165^b 14: methods employed, 172^b 10-28: test questions for detecting, 162^b 24-30, 177^a 2-6.

False Cause, Fallacy of (non causa pro causa), one of 7 fallacious refutations not dependent on diction, 166^b 26: analysed and illustrated, 167^b 21-36: its solution, *Soph. El.*, ch. 29; why deceptive, 169^b 13-17. a form of *ign. elench.*, 168^b 22-5: described as an 'argument

INDEX

dependent on some addition' 181^a 31.

Falsehood sophistical proof that a man can speak f and truth at same time, 180^b 2-7.

False diagrams (ψευδογραφεῖν, ψευδογράφημα), 101^a 6-17, 132^a 33, 157^a 2, 160^b 36, 171^b 12-16 drawer of f d. geometrician = contentious: dialectical arguer, 171^b 35-7, but with difference that f. d. employ genuinely geometrical principles, 171^b 38-172^a 8, 172^b 1-4

Faults of argument (faults of questioner, Bk. VIII, ch 11-12 (161^a 16 foll -^b 18, 162^b 3-24 N B. 16). F of a in itself) (in relation to proposed conclusion, 161^b 34-162^a 3

5 f of a. in itself, 161^b 19-33 another, 162^a 24-34. 5 test-questions for f. of a. in itself, 162^b 24-33. Argt always bad if premisses generally rejected, esp if also false, though not bad because premisses false, if generally accepted, 162^b 27-30.

Fever, 123^b 36.

Fire: its species, 'live coals' (ἄνθραξ), 'flame' (φλόξ), 'light' (φῶς), 134^b 28-9 embodied more in 'flame' than in 'light', 146^a 15-16. Its properties (1) to be 'body quickest to move upward in space', 130^a 10-14: (2) to 'move naturally upward', 103^a 29, 137^b 37. cf. 137^b 37-138^a 2 (3) to 'consist of most rarefied particles' (belongs *specifically*), 134^a 31; but contr. 134^b 31 foll, 135^a 4-5 (property of 'light'), and 139^a 9 foll (superlatives forbidden): cf (for incorrect rendering) 130^a 36-8 also cf. 130^b 29-32 (forbids rendering of (1) and (3) in one): 132^b 21-4 (forbids rendering of (3) in reverse order). Not def = 'body consisting of most rarefied particles', 146^a 13-18 Not its property (1) to be 'very like the soul', 129^b 10: (2) to be 'primary element in which the soul naturally exists', 120^b 18: (3) to be 'the lightest body' (forbidden, as superlative), 139^a

14-16. Cannot mix with 'colour' to form 'white', 149^a 39-^b 3 'Flesh' and 'bone' not 'compositions of fire with earth and air', 151^a 23.

Flame, a species of 'fire', 134^b 28-9 more of nature of fire than light is, 146^a 15, but consists of less rarefied particles than light, 146^a 16. Not its property to burn, 138^b 18-20.

Flesh, not def = the 'composition, of fire, earth, and air', 151^a 23-31 (cf *Bone*).

Forgetfulness = 'loss of knowledge', 153^b 27. but not vice versa, unless the object be presumed to remain unchanged, 157^b 11-16.

Form of Expression (Figura dictionis), Fallacy of; one of 6 fallacious refutations depending on diction, 165^b 27. illustrated, 166^b 10-19 Why deceptive, 169^a 29-36; more so in argument than in solitary reflection, 169^a 37-40, though here too, if reasoning becomes verbal, 169^a 40-^b 2 Rules for solution, Soph. El., ch. 22, and 179^a 20-4. depends on ambiguity, 168^a 23-6; results esp. from tendency to treat all predicates as if indiv substances, 168^a 25-6, 169^a 33-6, 170^a 15, and Soph. El., ch. 22, esp. 178^a 5-8, ^b 36-179^a 10 Compared to solecism, 174^a 5-9.

Fraction (πολλοστημόριον). $\frac{1}{2}$, a fraction, 114^a 15: relative to 'multiple', 114^a 17, 125^a 7-9: genus of 'half', 125^a 26-7.

Friendship if found in faculty of desire, not a kind of wishing, 126^a 12-13 cf. 113^a 2 More desirable than wealth (1) because prized for itself, 116^b 36-117^a 4, (2) because excess of it better than e. of money, 118^b 6. Friends) (man in the street, 118^a 2-5. Friends as test of comparative values of things, 118^a 1-2, cf. ^b 7-9.

Fusion, species, not genus, of 'mixture', 122^b 25-6, for it excludes m. of dry things, 122^b 30-1.

INDEX

Generic questions, 102^a 36:)(*definitory*, 103^a 3. *Differentia* 'generic', 101^b 18.

Genus, 101^b 17, 25, 38: ranked with *differentia*, 101^b 18-19: how distinct from, 128^a 20-9 [and see *Differentia*]. *Def.*, 102^a 31-2. Tests for *g.* apply to definition too, 102^b 27, 120^b 13, 139^b 3-5, 143^a 12-14. *Seldom* made subject of separate inquiry, 120^b 14. Rules for, Bk. IV, *passim*. 2 different *g.* of same term must be in subaltern relation, 107^a 18 foll., 121^b 29-30. All attributes of species belong to *g.*, 111^a 20-3, 27-9, not vice versa, 111^a 25-7: but contr. 143^b 26-8 (attributes of *g.* true of all species): properties belong in different manner to a genus (*τῷ μετέχοντι*) and to a species (*τῷ μετέχοντι*), 134^b 1-4, 18-22. Described as species or 'kind' (*εἶδος*), 133^a 35, ^b 1, 6, 10. *G.* and species 'synonymous', 123^a 28-9, 127^b 6, (cf. 154^a 18).

Subaltern)(*non-subaltern* genera, 107^a 19, 22, 33, ^b 19-26: 144^b 13, 19, 21, 23, 28.

God: cannot be injured, and ∴ cannot be wronged, 109^b 33: better than man, 116^b 12-15: a 'living being, who partakes of knowledge', 132^b 11: an 'immortal living being', 122^b 13-14, cf. 37-8 and 136^b 6-7 (Bekker):—a permanent property of *G.*, 128^b 19-20. Neither species nor genus of 'immortal', 122^b 12, 37. Has, but does not use, capacity to do bad things, 126^a 34-6. Not His property to be an 'intelligible living-being', 136^b 6-7.

The gods to be honoured, 105^a 5, 115^b 32.

Gold, genuine and sham, 164^b 22-4.

Good: a quality, 121^a 1: contrary of evil, 105^b 36, 135^b 14-15. Different meanings in diff. categories, 107^a 5-11: arguments on each to be drawn up, 105^b 13; question, how many, not dialectical, 158^a 16. Not referable to any higher genus, 123^b 8-12.

Not *def.* through 'evil' (because opposite, and ∴ not prior, to *g.*), 142^a 23-4; and ∴ not as 'contrary of evil' (circular), 147^b 18-25. Its property, to be 'desirable', 135^b 15-16: more conspicuous *g.* the more desirable, 117^b 28: 'better' generally 'more desirable', but distinguished, 118^a 8-15 (cf. ^b 37). Not its property to be 'most direct opposite of evil' (circular), 131^a 18-20. *G.* intrinsically)((*g.* as means, 106^a 4, 149^b 31-2, though intrinsic *g.* may also be *g.* as means, 149^b 35. intrinsic *g.* better, 116^a 29, ^b 22-3: cf. 116^b 37-117^a 4. Good)(useful, 124^a 16; cf. 147^a 34, 153^b 38. *G.* absolutely)((*g.* for *X* (*τινι*), 116^b 8. What is *g.* in a particular respect or at pr. 'time or for pr. person, not necessarily *g.* absolutely, 115^b 15 foll. Standard of what is better absolutely is verdict of better science, though to *X* (e. *g.* doctor) it may be that of his own science, 116^a 21-2. [For 'better science', v. 157^a 9.] Natural *g.*)((acquired *g.*, 116^b 10-12, cf. 119^a 9-11.

G. the genus of 'justice', 116^a 23-4; of 'health', 123^b 17-18; of the 'moderate' (or right) amount, 123^b 29-30; of 'virtue', 124^b 20-1, 144^a 10. Not genus of 'pleasure' (for some *p.* not *g.*), 120^b 17-20. [For 'good' and 'pleasure' cf. also 114^b 7-8, 39, 119^a 38-^b 1, 19-21, 120^a 7 foll., 124^a 17, ^b 8-14. and see also 'The Good'.]

A *g. thing* tested by its contraries, 113^a 1-14, ^b 27-34; by its co-ordinates, 114^a 39-^b 5; by the modes of its generation, production, and destruction, 114^b 16-24; by its variations in degree, 114^b 38-115^a 2: by adding it to other things, 115^a 27-9 (a positive test only, 115^a 33-^b 2). Tests of *better*)((*worse*, Bk. III, chh. 1-3: do. applied to simple distinction *good*)((*evil*, Bk. III, ch. 4. Of things *g.* as means, that is better (1) which does *g.* *per se* than that

INDEX

- which does g. *per accidens*, 116^b 1-4: (2) which is nearer to the end, 116^b 23: (3) whose end is better, 116^b 23, 26, 117^a 7, 118^b 32.
- '*The good*': not def. = the 'state of virtue' (circular), 142^b 12. Its property, to be 'the best', 136^b 31-2. Of goods, that is more desirable which is nearer, or more like, the g, 117^b 10-11. Doctrine that pleasure = the g., shows depravity and is invidious, 160^b 19-22
- G. *man*, not jealous, 109^b 36: has capacity, but not character, of doing evil, 126^a 34-6
- G. *life*, failure of Xenocrates' proof that it = happy life, 152^a 7-10, 26-30.
- G. *and evil*, see s.v. *Evil*.
- G. = merely 'expert' ('good thief'), 149^b 29.
- Wishing = conation for g., 146^b 6; i.e. for apparent g., 147^a 1-5.
- Sophistical proof that something can be both g. and not g., 180^b 9-21 (cf. 181^b 9-16).
- Doing good)(evil, to friends)(enemies, 104^a 22-33, 112^b 32-113^a 16.
- Goodenough-King* (Euarchus), 182^b 20.
- Good temper* (πραότης), not def. = 'control of anger' (rather implies complete immunity), 125^b 21-7.
- Gorgias*, 183^b 37. G., *the*, 173^a 8.
- Grammar*, def. = 'science of reading and writing', 142^b 33-4: not def. = (1) 'science of writing from dictation', 142^b 31-5; (2) 'science of letters', 146^b 6. A single science, 104^a 17-18: a kind of 'knowledge', 111^a 37, 124^b 19, 126^a 5, 19: not (like 'knowledge') a relative term, 124^b 19. To be 'capable of learning grammar', a property of 'man', 102^a 19-22.
- Greater and less degrees* (τὸ μᾶλλον καὶ ἧττον): attributes not admitting of, 115^a 32-3, 118^b 9. As tests of ambiguity, 107^b 13-18; of Accident, 114^b 37-115^a 14, 115^b 3-10, 119^b 17-30; of Genus, 127^b 18-128^a 12; of Property, 137^b 14-138^a 29; of Definition, 146^a 3-18, 154^a 4-11; of Sameness, 152^b 6-9: reckoned among most generally handy tests, 154^a 12.
- Greeks*, 152^a 13.
- Grey*, intermediate colour between 'white' and 'black', 106^b 6.
- Growth* (αὔξεισθαι), a species of 'motion', 111^b 5: does not always accompany being nourished (τρέφεσθαι), 111^b 25.
- Half* species of 'fraction', 125^a 26-7: its property, to be 'in proportion $\frac{1}{2}$ ', 135^b 26: not its property, to 'be exceeded' (τὸ ὑπερῆχόμενον), 135^b 21-2: rel to 'double', 135^b 20.
- Harmony* (συμφωνία), not the genus of 'temperance', 123^a 33-7, 139^b 33: always found in 'notes' (φθόγγων), 123^a 36-7.
- Harsh* (σφοδρός), intermediate sound between 'clear' (λευκός) and 'obscure' (μέλας), 106^b 7. [Cf *Grey*.]
- Hatred*. contrary of friendship, 106^b 2, 113^b 1: found 'n faculty of desire (if friendship be so), 113^b 2: does not follow anger, 113^a 35-^b 3.
- Health* (ὑγίειν): a kind of good, 123^b 17-18: desired as an end, 111^a 1, 116^a 29-30: contrary of 'disease', with no intermediary (μεταξύ), 123^b 17-18 (cf. 112^a 24-5), 123^b 34-5. Not def. = 'balance of hot and cold elements', for (1) 'balance' is ambiguous, 139^b 21: (2) h. is not inherent in hot and cold elements, 145^b 7-10. Follows 'vigour' (εὐξίαν), 113^b 35, 157^b 23-4: less good than vigour 157^b 19. Superior to 'means of h.', but still more markedly inferior to 'happiness', and therefore inferior to 'means of happiness', 116^b 29-36. Better than strength or beauty, 116^b 18; than beauty, 118^b 20. Medicine the science of producing h., 110^b 18, 141^a 19, 143^a 3-4. Ability to produce

INDEX

- h., a property of the doctor, 137^a 3-7: actual production of it, not so, 136^b 37. Recovery of h (το ὑγιαίνειν) good absolutely, 116^b 8-10 desirable as means to h., 117^a 20.
- Healthy* (ὑγιεινόν): ambiguous, 106^b 34-6, (1) productive of h, cf. 107^b 8, 110^a 19, 114^a 30-1; (2) preservative of h., cf. 114^a 30-1; (3) indicative of h, cf. 107^b 8. Good as means, 106^a 5-8 (contr. courage, good intrinsically), cf. 107^a 5-8. The doctor the judge of what is h., 110^a 20-2. H. 'absolutely' = h. to those in sound state of body, 142^a 11. Means of health contrary of means of disease, 163^a 18-19, cf. 150^b 11.
- Hearing* (ἀκοή, ἡκούσις): to 'possess h' cf. to 'hear', 114^b 27: not a property of hearing (ἡκούσις) to be a 'sensation', 135^b 31-3. h not a property of man, 138^b 8-10. 'Clearness' (in sound) distinguished by h., 106^a 30-2: cf 107^b 1-2. 'Beauty' not def = the 'pleasure that comes through sight or through h.', 146^a 22 foll
- Heraclitus* his paradoxes (1) that all things are in motion, 104^b 22 (cf. 160^b 19): (2) that good and evil are the same (involving denial of view that contrary predicates cannot coexist in same thing), 159^b 30-3.
- Hippias Major*, the; 146^a 22 n
- Hippocrates*, his method of squaring the circle, 171^b 15.
- Homer*, 157^a 15, 166^b 3, 171^a 10 (Epic cycle). Cf. *Iliad*
- Hypothetical reasoning* (οἱ ἐξ ὑποθέσεως συλλογισμοί) examination of likeness between things useful for, 108^b 8, 12 As test of Accident, 119^b 35-120^a 5 (cf. *Preliminary admission*); of Sameness, 152^b 17-24.
- '*Ideas*' (Platonic): motionless, 113^a 27, 148^a 20: intelligible, 113^a 26: cannot be said without self-contradiction to exist in us, 113^a 25 foll As sources of tests of Property, 137^b 3-13, of Definition, 143^b 23 foll., 147^a 3 foll., 148^a 13 foll.: classed among 'most effective' tests, 154^a 19'
- Ignorance* (ἄγνοια): def = 'privation of knowledge in the rational faculty', 147^b 29-34 I. of contraries one, 156^b 12.
- Ignoratio elenchi* [cf. *Refutation*] one of 7 fallacious refutations not dependent on diction, 166^b 24; but cf. 167^a 35: analysed and illustrated, 167^a 21-35: its solution, *Soph. El.*, ch. 26; why deceptive, 169^b 9-12. All fallacies analysable into it, *Soph. El.*, ch. 6.
- Iliad*, the, 166^b 5 n., 9 n., 180^a 21.
- Inelman*, conj. 128^a 31.
- Immortal* not def. = a 'living being immune at present from destruction', 145^b 21-3: differentia, rather than genus, of God, 122^b 12: not species of God, 122^b 38. 'Immortal living being' a permanent property of God, 128^b 19-20.
- Immortality* not def. = 'everlasting life', 126^b 35; nor any kind of life; rather an accident (συμπωμα) or affection (πάθος) of life, 126^b 36-127^a 2.
- Impossible*. Argument *per impossibile*, suitable for demonstration, not for dialectic, 157^b 34 foll-158^a 2: called 'conversion', 163^a 32-6. A. *ad impossibile*, 162^b 7, 19-22, 167^b 23, 170^a 2: ex, 167^b 27-34.
- Incisive* (δριμύς) argument def. = 'one which produces greatest perplexity', 182^b 32: most incisive of syllogistic arguments, 182^b 37; of contentious arguments, 183^a 7.
- Incontinent man*, not def = 'one who is mastered by pleasures' (unless quality of p. be stated), 146^b 25.
- India*, 116^a 38: *Indian*, 167^a 8.
- Indignant* (μεσητηρός), def. = 'grieved at prosperity of wicked', 110^a 3:)(jealous, 110^a 1.
- Induction* def., 105^a 13, cf. 156^a 4 6: more convincing and clearer than deduction, 105^a 16: appeals more to senses and to mass of men, 105^a 17-18, 156^a

INDEX

- 4-7, 157^a 19-20; should be practised with the young, 164^a 12 (to secure stock of parallel cases, *παράδολαι*). Study of 'likeness' useful for, 108^b 7, 9. Recommended, 105^b 27, 113^b 17, 29; 115^a 5: cf. 120^a 32: 122^a 17-19: 123^b 7. 155^b 34-156^a 1. J. and argument from likeness (analogy), their resemblance and difference, 156^b 14-17: the 2 usual ways of establishing a universal, 160^a 37-9. Inductive premisses, not 'necessary' premisses, 155^b 20-2. Superfluous 1, a method of securing 'ornament' for argument, 157^a 7. Results of 1, to be accepted, unless neg instance forthcoming, 157^a 34 1. 'through the view laid down', 'through the thesis', as means of diversion to more favourable subject, 111^b 38-112^a 1, 112^a 5-6. Difficulty in 1 arising from absence of suitable common names (see *Likeness*)
- Inequality* def = 'privation of equality', 147^b 5, 14-15
- Inflections* (*πτωσεις*) of X def as forms related to X as adverb to adjective, 114^a 33 (cf. 106^b 29 foll., 124^a 12-14, 148^a 11-13, 151^b 32): also gender-endings, 173^b 27-9; case-endings, 136^b 20-2, 173^b 32 foll. (cf. co-ordinates, 114^a 32; often held to be included in them, 114^a 34 treated together, 124^a 10-14, 151^b 30-3, 153^b 25 foll.)
- As tests of ambiguity, 106^b 29 foll.; of Accident, 114^a 26 foll., of Genus, 124^a 10-14; of Property, 136^b 15-32; of Definition, 148^a 10-13, 153^b 25-35, of Sameness, 151^b 28-33. reckoned among most generally handy tests, 119^a 36-8, 154^a 12-13. Confusion of 1, a great source of solecism, 173^b 26-174^a 11.
- Inherence* in... (τὸ ἐν τινι, ἐν ὑποκειμένῳ, λέγεσθαι): ('predication of...') (λέγεσθαι, κατηγορεῖσθαι, κατὰ...), 127^b 1-4: but syn, 132^b 19-34. As test of comparative values of things, 116^b 17 foll.; of Genus, 125^a 33 foll., 127^b 1-4; of Property, 132^b 19 foll.; of Definition, 145^a 33-^b 11, 150^a 26-33, 151^a 32-^b 2 'Disposition', 'state', 'balance', 'affection' must be inherent in the thing whose disposition, &c., it is, 125^a 35-7, 145^a 33-^b 11.
- Injure* God cannot be injured, 109^b 34-5.
- Injurious* (βλαβερὸν) = (1) productive of evil; (2) destructive of good, 147^a 34-5: contrary of 'useful', ib
- Injustice*, a species of 'Vice', 123^b 15, 21, 32: a vice of the soul (of the body, 153^b 8-10.
- Not its property to be 'lowest evil' (το χείριστον), because its contrary (justice) not 'highest good', 135^b 10-12. Of a 'foul' (in race or fight), 171^b 22, 174^a 22. 'Do injustice' (*ἀδικεῖν*) def. = 'injure deliberately', 109^b 33-4.
- Intelligible* 'absolutely' 1 (1) 'to us', 141^b 4: same to persons of sound understanding, 142^a 9. Prior terms more 1 absolutely than posterior, 141^b 5; but posterior sometimes more 1. to us, 141^b 9 (cf. 156^a 6-7). Objects of sense more 1. at first; then objects of thought, 142^a 2-4: o. of sense more 1. either absolutely or to most people, 141^b 9-12, 156^a 6-7. Exx., 111^a 9-10, 129^b 10-12, 26-8, 141^b 6-9, 149^a 5-7, 16-17. More 1. terms required for correct rendering of Property, 129^b 2 foll. (in 2 senses, 5 foll., 13 foll., cf. 131^a 3, 12: in Definition, 141^a 26-^b 2, 142^b 20-1 (cf. 150^b 22-3): sources of failure here, (1) 141^b 3-142^a 18, (2) 142^a 19-21. cf. 26.
- Intractability* in a problem (*δυσεπιχειρήτων*): its sources, 158^b 16-159^a 4.
- Jealousy* def. = 'pain at the apparent success of some well-behaved person', 109^b 36: not an attribute of the good man, ib. (cf. Indignation, 109^b 38.
- Judging* (*κρίνειν*), the genus of 'perceiving', (*αἰσθάνεσθαι*), 111^a 19.

INDEX

Juncture (συνσχῆ), species, not genus, of 'contact' (ἄψις), 122^b 25-6.

Just, ambiguous, 106^b 30: one of the meanings of good, as applied to the soul, in category of Quality, 107^a 5-8. What is j., sometimes evil, 119^b 4. Not a property of what is j. to be 'beautiful', 136^b 17-18. Sophistical proof that what is unjust may be preferable to what is j., 180^b 21-39.

Justice, a good 116^a 24: good intrinsically, 106^a 4-8: contrary of injustice, 135^b 10;)(courage, 108^a 1-2 (cf. 151^b 31-3): may belong in one respect only, 109^a 21-2. Not = knowledge, 114^b 8, 120^a 30 (cf. 124^a 12-14); not a species of knowledge, 121^b 26-30. A species of virtue, 109^a 35-^b 1, 121^b 26, 123^b 15, 21, 32, 127^b 20: of the expedient, 141^a 17. Found in soul, 150^b 35, cf. 153^b 8-10. Not def. (1) 'control of gains', 125^b 22-7, (2) 'state that produces equality' or 'that distributes what is equal' (too wide), 143^a 15-19, (3) 'ability to distribute what is equal' ('choice' rather than 'ability'), 145^b 35-146^a 2, (4) 'what preserves the laws', 149^b 32; (5) 'temperance and courage', 150^a 3-21.

Not its property to be highest good, 135^b 11. Praiseworthy, 114^b 2; better than a just man, 116^a 23, ^b 10, 117^b 11; than strength, 116^b 38; than courage, 117^a 36, 38, 118^a 17, 36. In friends desirable essentially, in enemies *per accidens*, 116^a 31-5. Happiness better than j. and courage combined, 117^a 21-3. Genuine j. more desirable than apparent 118^a 3-4. Legal)(natural valuation of j., 173^a 11 (cf. *Law*).

Justly ambiguous, 106^b 29-33. not = 'knowingly and skilfully', 114^b 9. J. and 'knowingly', 124^a 13: j. and 'bravely', 151^b 32-3.

Not a property of what is done j. to be done 'beautifully' (καλῶς), 136^b 17-18, or 'well'

(ἀγαθῶς), 136^b 27-8: to act j. more desirable than bravely, 118^a 36: an act done j. may be evil, 119^b 5. v. also 180^b 21-3.

Knowledge (see also *Science*): a kind of 'disposition' (διδάσκεις), 111^a 23, 145^a 36; of 'state and disposition', 121^b 38, 124^b 33-4, 125^a 1, of 'conceiving' (ἐπιόλη-ψις), 114^a 18, 119^b 3, 125^a 9-11; cf. 130^b 15, 131^a 23; of 'conviction' (πίστις), 128^a 25-7. Not a kind of 'good' (for 'k.' a rel. term, 'good' a quality), 121^a 1-3; of sensation, 125^a 28-32. Not = a knower, 126^b 33. Def. = 'conception of a knowable', 146^b 5. not def. = (1) 'unsupplantable' (metaph.) 139^b 32; (2) 'incontrovertible conception' (c of *what?*), 146^b 2. To 'know', not a property of man, 138^a 6-8:)('be thinking of' (διανοεῖσθαι), 114^b 32-7. K. sometimes bad 111^a 23, 119^b 9 foll. A relative term (contr. its species, e.g. 'grammar'), 124^b 19; rel. to 'object of k.', 124^b 33, 149^b 11; should be defined in reln. to its best object, 143^a 11: fourfold ambiguity of phrase, 'the knowledge of A', 130^a 19-22. Its property, to be (1) 'the most convincing conception', 131^a 23-6, (2) 'incontrovertible by argument'—belongs to k. because k. is the state of some one (τῷ ἐχέσθαι), as also to scientist τῷ εἰχεῖν, 134^a 36^b 1, 17 [the solution of the objection raised in 133^b 28-31]. K. and 'justice', 114^b 9, 121^b 26-30 (cf. 124^a 12-14). K. and 'prudence', 120^a 28-31, 137^a 14. K. and 'memory', 125^b 6-10. K. and 'ignorance': def. of k. implies def. of ignorance, 147^a 17 (cf. 151^b 1-2): 'ignorance' = privation of K., 147^b 30, though not so 'error', 148^a 8. K. and 'forgetfulness', 153^b 27, 157^b 11-16. K. and 'sensation', 105^a 28-30, 108^a 4, 156^b 11-14: k. of objects of sense assumed possible, 114^a 21; but often denied, 114^a 23: obj. of k. not a kind of obj. of s., 125^a 29.

INDEX

'Obj. of k.' not the genus of 'obj of opinion' (*δοξαστων*), 121^a 21-5. That 'k of many things is one', ambiguous, 110^b 17: 'k. of opposites one', 105^b 33, 109^b 17, 155^b 32, 163^a 3 (noted as opinion of 'some people', 142^a 24-5); do of 'contraries', 104^a 16, 105^b 5-6, 34, 155^b 31, 156^b 11, 163^a 2 (cf *Ignorance*), do of 'relatives', 105^b 34. To be 'capable of receiving k.' a property of 'man', 103^a 28, 128^b 35, 130^b 8, 132^a 19-21, 131-3, 133^a 20-3, 134^a 14-17; though no part of his definition, 140^a 35-6: cf 102^a 19-22 ('capable of learning grammar'): not a differentia of 'soul', 151^b 1. To 'partake of k' not a property of man (true also of God), 132^b 10-13. Faculty of desire not capable of receiving k. and 'not of ignorance, 113^b 3-6. 'Self-k' possible, not necessary, to soul, 125^a 39-40 (cf 134^a 4). 'Speculative k.' not = 'speculative conception', 149^a 9-13;)(practical knowledge, 152^b 4.

Lang, P., 174^b 27 n

Law not def. (1) a 'measure of what is by nature just': (2) an 'image of do.', 140^a 7-8 (3) an 'image of what is by nature noble and just', 141^a 20-1. L. (convention) opp. Nature, frequently leads to paradox, 173^a 7-18, 27-30. L. represents 'opinion of majority', as opp to the true nature of things, 173^a 29-30.

Learning, as species of recollection, 124^a 22. Rules for 'teachers and learners')(those who argue 'contentiously' or 'in spirit of inquiry', 159^a 11-14, 26-8: cf. 161^a 24-5. Cf. *Didactic argument*.

Length (*μηκος*), genus of 'line', 143^b 16: its differentiae 'without breadth')('with breadth', 143^b 14, 19. 'Idea' of l (*αὐτὸ μήκος*), 143^b 24, 31.

Life=ζωή: ambiguous; no single type of l. in animals and plants, rendering single def. impossible,

148^a 27 foll.: hence Dionysius' def of it = a 'movement of a creature sustained by nourishment, congenitally present with it' fails. A property (1) of 'living being' absolutely, 134^a 32, cf. 138^a 27-9: (2) of a particular kind of living being, because it partakes of l. b. (*καὶ μετεχειν*), 134^b 4, 20-2. L.)(good l, 118^a 7. Not genus of immortality, 126^b 35: the soul has a share of l, 123^a 25.

(δ) = βίος. L. of virtue)(of enjoyment, 102^b 17: Xenocrates' proof that happy l = good l, 152^a 7-10, 26-30. The 'end of l', 116^b 24.

Light (α) = φῶς, a species of fire, 134^b 28-9. Less of nature of fire than flame is, 146^a 15-16. Its property, to consist of most rarefied particles of all species of fire, 134^b 32-4, 135^a 4-5, 146^a 16-17.

(δ) = βαρύ, contrary of 'heavy', 106^a 18-19.

Like degrees (*καὶ ὅμοιος*), argument from, as test of ambiguity, 107^b 13-18, of Accident, 115^a 15-24, 119^b 17, 21-6; of Genus, 127^b 26-36, 128^a 5-6, 10-11, of Property, 138^a 30-32 (contr. argt from 'like relations', 138^b 23-6); of Definition, 146^a 18-20, 154^a 4. Reckoned among handiest tests, 154^a 12.

Likeness of things to be studied, 105^a 25 and Bk I, ch. 17: importance of observing, 108^b 7 foll. 2 draughts of water from same spring differ from others only by more marked l, 103^a 19-22.

L or like objects (*καὶ ὅμοια*), as tests of Accident, 114^b 25-36, of comparative values of things, 117^b 10-14, 20-1:—objections, that likeness of A to B may be irrelevant to good points of B (14-17), or inexact, i.e. unflattering or flattering to B (17-19, 25-7), or but slight (21-5):—as tests of sameness, 156^b 10-17. Argument from l (analogy) and Induction [v. *Induction*]. Difficulty of argument from l when no common name to express

INDEX

'point of l., 157^a 21-33 : cf. 174^a 37-40: answerer shd. then plead ambiguity, 176^a 33-5.

L. of relations of things (τὰ ὁμοίως ἔχοντα πρὸς ἀλλήλην), when A : B = α : β ; as tests of Genus, 124^a 15-20; of Property, 136^b 33-137^a 7 (cf. 138^b 23-6); of Sameness, 152^a 1-2. For contrast with argument from 'like degrees', v. 138^b 23-6.

Line: not def. (1) = 'length without breadth', 143^b 12-23 (2) 'length with breadth', 144^a 1-2 (3) 'limit of a plane' (except when necessary *ad hominem*) 141^b 5-25. Prior to, and ∴ more intelligible absolutely than, 'plane'; posterior to, and ∴ less intelligible absolutely than, 'point', 141^b 5-7. No 'product' of l. and 'number', 150^a 24-5. Fallacy produced by misdrawing l., 101^a 16 (and see *False diagrams*). 'Straight ls.' all one species, 121^b 22-3: 'finite str. l.' not def. = the 'limit of a finite plane such that its centre is in line with its extremes', 148^b 26-32 [for end of def., which should define 'straightness', inapplicable to infinite str. l., which has no middle or extremes]. 'Indivisible ls.', 121^b 19: 'indivisible' not their genus, 19-23.

Liquid (ὕγρον): a species of 'body', 130^b 35: its property, to be a 'body adaptable to every shape', 130^b 34-7.

Literal (usual meanings of words, 112^a 34-8.

Living being (ζῶον): its differentiae, 'mortal' (cf. 'immortal', 122^b 13-14: its property, 'to live', belongs 'absolutely', 134^a 32, 136^a 25-8: cf. 138^a 10-12: hence also of 'not-living being' (μὴ ζῶον), 'not to live' (μὴ ἔχειν) 136^a 25-8. A 'particular species of l. b.' has property of 'living' by reason of 'partaking' in nature of l. b. (τῷ μετέχειν), 134^b 4.

To be (1) a 'l. b. that partakes of knowledge' not a property of man, for belongs also to God,

132^b 10-13: (2) an 'intelligible l. b.' not a property of God, 136^b 6-7: (3) 'a sensible l. b.', not a property of l. beings other than God, ib.

Living creature (ζῶον): not def. = a 'composition of soul and body', 151^a 21-31. Its properties (1) to be 'compounded of soul and body' (permanent property), 129^a 2, 131^a 8, 137^b 11-13: (2) to 'have a soul', correctly stated so far as no universal predicate is introduced 130^b 20-2, and attribute is convertible with subject, 132^b 16-18; but defective in so far as genus of l. c. (viz. 'substance') is not stated, 132^a 15-16: (3) to be an 'animate substance', 135^a 16-19, cf. 136^a 12. Hence 'being inanimate' not its property, 136^a 12-13; and being 'animate' not property of what is not a l. c. (μὴ ζῶον), 136^a 33-4. 'Idea' of l. c. (αὐτοζῶον), 137^b 11.

Locomotion (α) = ἡ κατὰ τόπον κίνησις or μεταβολή: genus of 'carriage' (φορά), 122^b 27, 32 foll., 128^a 3-5: Plato's identification of l. and 'carriage' rejected, 122^b 26 foll. [cf. *Carriage*] (b) = φορέα. A species of 'motion' (κίνησις), 121^a 31, 127^a 23-6: Pleasure not = l., 121^a 31. L., genus of 'walking' (βαδισις), 122^a 21-30. [N.B. φορα here = ἡ κατὰ τ. κίνησις, or μεταβολή, of 122^b 27, 32; for walking (βαδισις) and 'carriage' (φορά) are co-ordinate species of same genus, 'locomotion': cf. 142^b 3 (φορά ἡλίου ὑπὲρ γῆς.)

Love (1) sexual (ἔρως): not def. = 'desire for intercourse' (do not vary in degree together), 146^a 9-12, 152^b 7-9.

(2) = ἀγαπᾶν: problem whether parents shd. be loved not dialectical, 105^a 3-7.

(3) = φιλεῖν: ambiguous; spiritual (physical meaning, 106^b 2-3. In former sense, contrary to 'hate'; in latter, no contrary, ib.

Lycophron, his response to a call

INDEX

for an encomium on the lyre,
174^b 32.
Lysander, 176^b 5.

Man: a substance, 103^b 29-31; does not admit variations in degree, 115^b 9, but see 137^b 32-3: a species of 'animal', 102^a 34-5 (cf. 112^a 18, 113^b 17, 125^b 37-9), 128^a 24-5, 131^a 4-5. Def. = 'animal that walks on 2 feet', 140^b 33-4; cf. 112^a 18-19: his defn. an ex. of a dialectical problem or proposition, 101^b 30: not well def. (1) with addition, 'capable of receiving knowledge' (v. Plat. Def. 415 a). 140^a 35-7 (cf. 151^b 11): (2) = a 'walking biped animal, six ft. high', 140^b 23-6: (3) = 'that which knows how to count', 142^b 24. M. the same *inter se* (specifically); as horse or dog (generically), 103^a 10-14, 108^a 14-16: better than a horse, 117^b 35. A property of m. to be (1) 'by nature a civilized animal'—an *essential* property, 128 17, 130^a 27-8, 132^a 6-9, 138^a 11, 139^a 18-20: (2) a 'biped'—a *relative* property [(a horse), 128^b 25, of a kind universally and always present, 129^a 8-10: Contr., however, 134^a 8-11, where disallowed as being normal (cf. 134^a 29) but not invariable: (3) 'a walking biped', 133^b 8, 136^b 20-2: but contr. 133^a 3-5, 132^a 1-4: (4) a 'mortal living being, capable of receiving knowledge'—an *essential* property, 128^b 35: (5) an 'animal capable of receiving knowledge', 103^a 28 (cf. 112^a 18-19), 130^b 8, 132^a 19-21, 133^a 20-3, 134^a 14-17 (cf. 102^a 19-22, 'capable of learning grammar'); but contr. 132^b 10-13 (see (3) below): (6) a 'mortal' (*θνητός*); hence of 'becoming a man', to 'become a mortal'; of the 'destruction of a man', the 'destruction of a mortal', 137^a 34-7: (7) 'possessed of a tripartite soul', 133^a 30-2. *Not* a property of man (1) to be an 'animal', 136^a 19: hence not of what is 'not man' 'not to be

an animal'; nor of 'becoming a man' to 'become an animal'; nor of the 'destruction of a man' to be the 'destruction of an animal', 137^a 24-7: (2) to be a 'walking biped' (belongs as part of essence, *κατὰ μέθεξιν*), 133^a 3-5; or a 'walking biped animal' (his def.), 132^a 1-4: (3) to be a 'living being who partakes of knowledge' (true also of God), 132^b 10-13: (4) to 'move by his own initiative', 133^b 1-5: (5) to 'walk through the market-place' (never, or not always, a property), 133^a 15-18: (6) to be 'motionless' (*ἡρεμεῖν*): belongs to 'idea' of man only qua 'idea', not qua 'man', 137^b 6-8: (7) to be 'virtuous' (*τὸ σπουδαῖον*): hence not of what is 'more human' (*μᾶλλον ἄνθρωπος*) to be more virtuous, 137^b 31-3: (8) to 'know', 138^a 6-8: (9) to 'see' or 'hear', 138^b 8-10: (10) to 'sleep', 102^a 22-4.

To be 'sitting', an accident of m, but a *temporary* property of any one who alone is sitting, or a *relative* property (those not sitting, 102^b 21-4. M.) (white m.: sophistical puzzle regarding their attributes, 133^b 16 foll.: different mode of being, 133^b 33-5.

A 'particular man' (*ὁ τις ἄνθρωπος*); his property (1) to be 'walking in the gymnasium',—a *temporary* property, 128^b 20-1: 129^a 3-5: (2) to be 'walking now',—a property *of the present time*, 131^b 16-18: (3) to 'possess 4 fingers'—an *actual* property (*το ἰσχύον*), 134^a 30. *Not* his property, 'to be sitting with X'—rather a *temporary* property, 131^b 11-14 (cf. 102^b 20-6). 'Third man' (*ἑρπύς ἄνθρωπος*), neither 'Man' nor 'a man', 178^b 36-9.

Mandrobulus, the, 174^b 27.

Many questions (double question), Fallacy of: one of 7 fallacious refutations not dependent on diction, 166^b 27: illustrated, 167^b 38-168^a 16: rules for solution, Soph. El., ch. 30: why

INDEX

- deceptive, 169^b 14-17: a form of *ign. elenchi*, 169^a 6-18. At root of fallacies of ambiguity and amphiboly, 175^b 39-41.
- Marrow*, not to be described in definition as 'bone-formed', 140^a 5.
- Maxim* (γνώμη) = (1) true opinion, (2) general assertion, 176^b 18.
- Medea*, 183^a 2 n.
- Medicine* (α) = φάρμακα: to take it expedient at times, but not absolutely, 115^b 26.
(β) = ἰατρική, the science both of producing health and of dieting, 110^b 18: not def. (1) = 'knowledge of what makes for health in animals and man' (redundant), 141^a 19-20: (2) = 'knowledge how to produce disease and health' [= kn. how to produce health essentially, disease only accidentally], 143^a 3-8: (3) = 'science of reality' (Hippocrates' defn.: much too wide), 149^b 6-10. Enables not always to cure, but to do all that is possible to cure, 101^b 8-10. In m. the 'good' = what produces health, 107^a 6; in m. that is more desirable which most or all doctors would choose, 116^a 17-18.
- Melissus*: (1) paradox that Being is one, 104^b 22: (2) argument that universe is eternal, 167^b 13-18, 168^b 35-40, 181^a 27-30: (3) 168^b 37, 40-169^a 3.
- Memory*, an activity, not a state, 125^b 18. Not def. (1) = 'abiding of knowledge', 125^b 6 foll.: (2) 'a state retentive of a conception', 125^b 17. Knowledge not 'remembering', for may be of present or future, 111^b 27-31. Mnemonic *loci*, 163^b 29-30.
- Metaphor* always obscure, 139^b 34: based on resemblance, hence renders subject partly intelligible, 140^a 9-11. M. condemned in rendering genus, 123^a 33-7: so too metaphorical definition, 139^b 32 (cf. 158^b 8-15), though not so bad as def. inapplicable even metaphorically, 140^a 6-17. Makes a problem intractable (δυσεπιχειρήτων), 158^b 17.
- Misreasonings* (παράλογισμοί) from premisses proper to special sciences, 101^a 5-17, 170^a 31-4: exx. from maths., 101^a 15-17, 171^b 38-172^a 5: due to ignorance of force of words (ambiguities, &c.), 165^a 15.
- Mixture* (μίξις); the genus, not a species, of 'fusion' (κρᾶσις), 122^b 25-6, since includes m. of dry things and ∴ of wider denotation, 122^b 30-6: not a differentia of 'fusion' (for same reason), 123^a 3-4.
- Moderate* (or right) amount (τὸ μέτριον): intermediate between 'defect' and 'excess', 123^b 29: a species of 'good', 123^b 30 (in category of quantity, 107^a 10-11).
- Motion, Movement* (κίνησις), a kind of 'activity', 125^b 17: genus of 'growth, destruction, coming-to-be, &c.', 111^b 5; of 'locomotion (φορὰ), alteration, &c.', 121^a 31-2: of 'locomotion, growth, decrease, &c.', 122^a 28-9; of 'walking', 128^a 32-3. Possibly not found in soul, 123^a 15-16. Not genus of 'soul' (even if found in it, is liable to fail), 120^b 24, 123^a 15-17, 127^b 15-17. Heraclitus' doctrine that all things are in m., 104^b 21 (cf. 160^b 19): Zeno's doctrine that there is no m., 160^b 8, 19. 'Wind' = a 'm. of air', rather than 'air in m.', 127^a 4.
- Mud*, not = 'earth mixed with moisture', 127^a 14; nor any kind of earth at all, ib.
- Multiple* (πολλαπλάσιον), genus of 'double', 121^a 4-5, but only in reln. to same unit, 124^b 24-7. a kind of 'excess', 124^b 29-31: rel. to 'fraction', 114^a 17, 125^a 6-9, 26-7: cf. 121^a 4-5. $\frac{2}{3}$ a multiple, 114^a 15.
- Multiplication-table*, to 10 (οἱ κεφαλίσμοι), 163^b 25.
- Music*, a kind of 'science'—111^a 37, ^b 2, 128^a 31-3. M. and grammar, 104^b 26.
- Natural ability* (εὐφύια) for philosophy, def. = 'the power rightly to choose the true and shun the false', 163^b 13-15: appearance

INDEX

of, cultivated by disclaiming love of hard work, 118^a 22.

Nature)(convention : see *Law*. A 'particular n.' = a particular kind (*γένος*) of being, 172^a 37.

Necessary : N. events)('usual' events (*τὰ ὡς ἐπὶ τὸ πολὺ*), 112^b 1 :)(the contrary of 'usual' (i.e. 'comparatively rare') events (*τὰ ἐπ' ἑλαττων*), 112^b 9 foll. :)('chance' events (*τὰ ὁπότερ' ἔτυχεν*), 112^b 2, 13; be n.)(be possible (*ἐνδέχασθαι*), 121^a 10, 152^b 32. N. premisses (see *Premisses*). Changes of subject, n.)(apparently n.)(neither really nor apparently n., Bk. II, ch 5 *init*. Attributes that are not n., require renewed confirmation by sense, 131^b 21-5. Necessaries)(superfluities (*τὰ ἐκ περισυρίας*), 118^a 6 foll. : superfluities the better, though not more desirable unless necessities are already present, ib. N. predicates (of S and P) as tests of Accident, 112^a 16-23.

Nestor, 117^b 24.

Night, not def. = a 'shadow on the earth', 146^b 28.

Not-being (*μὴ ὄν*) : contradictory of Being, 109^b 23 (cf 19) : always predicable of what is 'coming to be', 128^b 6; but not convertible with c-to-be, 128^b 7; nor its genus, 128^b 8 : nor the genus of anything at all, 128^b 9.

Number : always either odd or even, 120^b 4, 142^b 9-10, cf. 123^a 13-14 : 'odd' as differentia, 122^b 19, 23-4. Not the genus of 'odd', 122^b 18; nor its species, 123^a 1-2. Unable to combine with 'line' to have a 'product' (*ἐκ τούτων*), 150^a 24-5. Posterior to, and ∴ less intelligible absolutely than, 'unit', 141^b 5-9 : though unit generally defined through it, = 'starting-point of number', 158^b 26, 29. The soul not a n., 120^b 3-6, 123^a 11-14, 23-6.

Numerical sameness [v. *Sameness*].

Oath : Sophistical proof that o can be broken and kept at same time, 180^a 34-5, 38^b 1.

Objection (*ἐνστάσις*) : **Exx.** of, 114^a 20; 115^b 15; 117^a 18, ^b 14; 123^b 17, 27, 34; 124^b 32; 128^b 6; 134^b 25 (cf. 135^a 6); 156^a 35; 157^b 2, 8, 17; 160^b 2, 8 foll. O. to be invited, 109^b 28, 120^a 37, 157^a 34, ^b 1, 160^b 1; to be brought, 110^a 10, 156^b 18. Should not be directed to actual point asked, if other ground can be found, 157^a 37-^b 2. 4 kinds of o :—(1) Solution of fallacy : (2) O ad hominem : (3) O. to questions asked : (4) O. to time allowed (cf. *Time*), 161^a 1-15. Readiness in o a principal aim of dialectic training, 164^b 1-4 : objecting)(putting propositions, 164^b 4-7. How to meet o., 134^a 3-4, 157^b 6, 9, 20, 24 : easy if proposition be partly true, partly false, 157^b 25-31 : **exx.** 114^a 22, 156^a 38, 157^b 11-16, 17-24.

Captious o. (of answerer) or **false suggestion** (of questioner) (*συκοφαντεῖν*), 139^b 26, 157^a 32.

Objectionable (*φενκρόν*) contrary of desirable (q.v.), 113^b 33-4, 135^b 15 (cf. 117^b 5, 118^b 34) : property of 'evil', 135^b 14-16.

Obscurity (*τὸ ἀσαφές*) : sources of, 139^b 19 foll. (1) ambiguous terms (139^b 19-31, cf. 130^a 2-3), (2) metaphorical terms (139^b 32-140^a 2), (3) unfamiliar terms (140^a 3-5), (4) inappropriate terms, whether lit. or metaph. (140^a 6-17), (5) expressions which conceal their contrary (140^a 18-20) or their own meaning (20-2). Renders defin. intractable (*δυσενιχείρητον*), 158^b 12-13. Hints for examining Accident, when indeterminate (*ἀδιόριστον*), 120^a 6 foll. ; for examining obscure defin., 151^b 7-17; for answering obscure questions, Bk. VIII, ch. 7 (160^a 17-33).

Odd, the differentia of number, 122^b 19, 23-4, 123^a 11-13, 142^b 10; not its species, 122^b 18-24; not its genus, 123^a 1-2. 'Odd no' not def. (1) = 'that which is greater by one than an even no.', 142^b 8; (2) = a 'no. with a middle', 149^a 30-7 (cf. 173^b 8-9).

INDEX

Odysseus, 117^b 13, 24.

Opinion: 'true or false' not differentia of o., for it may be neither, 123^a 15-18.

Conformity with general o. the aim in dialectic, as truth in philosophy, 105^b 30-1 (and v. *Dialectic*). Dialectic must study o. of crowd, 101^a 31, 105^a 35; of majority, 105^a 36; of philosophers, ib.; of experts, 105^b 1; also unusual o., 105^a 37. One o. may have more than one object, 114^b 25-6. O.-in-itself (*αὐτόδοξα*), 162^a 30-1.

Object of o., not a kind of 'being', because wider (including things non-existent), 121^a 21-5, ^b 3-4: not a kind of object of knowledge, because wider (including things not knowable), 121^a 21-5. Basis of sophistical proof that what is not, is, 167^a 1-2 (cf. 180^a 32-4). 'Obj.-of-o.-in-itself' (*δοξαστὸν αὐτό*), 162^a 28.

Opposites (*ἀντικείμενα*): 4 kinds (1) relatives, (2) contraries, (3) privation and state, (4) contradictions, 109^b 18-19, 113^b 15. Simultaneous by nature, 142^a 24. Def. of term through its o. a fault, 142^a 22 foll., but sometimes inevitable, 142^a 26 foll. def. of o. should be o., 147^a 29 foll. As tests of Genus, 125^a 25-32; of Property, 131^a 14-26, 135^b 7-136^a 13, 136^b 23-31; of Definition, 153^a 26-9; of Sameness, 151^b 33-6: reckoned among the handiest and most general of tests, 119^a 36. Knowledge of opposites one (see *Knowledge*).

Ornament (*κόσμος*) in argument, how secured, 157^a 6-13 (cf. *Weightiness*).

Pacius' edition, 132^a 36 n., ^b 3-8 n. 137^a 12-17 n., 183^a 2 n.

Pain (*α*) = λύπη: not genus of 'anger', 125^b 29, 126^a 6-12; in spite of apparent claim, 127^b 30: rather a cause of anger, 125^b 33-4 (cf. *Anger*). 'Jealousy' a kind of p., 109^b 36, 110^a 1; 'Indignation', a kind of p., 110^a 2-3. P. of thirst contrary

of pleasure of drinking, 106^a 37. Things better without p. than with, 117^a 24. That p. is evil, as general a belief as that pleasure is good, 119^a 38-^b 1. To cause p. and repentance may be sufficient punishment, 156^a 39.

(*b*) = ἀλγηδών: not def. = 'violent disruption of parts naturally conjoined', 145^b 2-7 (pain not inherent in sundered parts), 145^b 12-14 (gives cause rather than def. of p.).

Paradox. To lead into p., one of chief aims of questioner in dialectical reasoning, 159^a 18-20; in contentious argument, 165^b 14 (cf. 183^a 29): methods employed in contentious argument, 172^b 10-24, and 29-173^a 30; 174^b 15-17: often results from leaving ambiguity undisclosed, 175^b 33-7. Should not be asked point-blank in contentious argument, 172^b 21-4. Solutions suggested of arguments designed to lead to p., 172^b 19-21, 33-4: cf. 176^a 25-7. P. maintained by well-known philosopher = a Thesis (q.v.), 104^b 19 foll. Sophistical method of overthrowing paradoxical thesis, 174^b 12-18. Paradoxical thesis to be avoided in dialectic, 160^b 17: 2 forms of it, 160^b 18-22.

Paralogism (see *Misreasoning*).

Parmenides: argument that Being is one, 182^b 26.

Passivity, a category, 103^b 23. See *Activity* (*ποιεῖν*).

Peculiar, Peculiarity (*ἰδιον*), 101^b 17: applied either to Definition or to Property, 101^b 19: cf. 139^a 31, 140^a 33-4, ^b 19-22, 149^b 19.

Peloponnesians, 152^a 13, 15, 17, 20, 23.

Perception (*πισθάνεσθαι*), a kind of judgement, 111^a 16, 19. Not a property of 'animal', 138^a 7. P. of contraries one, 104^a 16, 105^b 5, 156^b 12-14. Problems soluble by p., 105^a 7. [Cf. *Sensation*.]

Perplexity (*ἀσπορία*) not def. = 'equality of contrary reasonings', 145^b 1-2, 4-7, 16-20:

INDEX

- two kinds of, 182^b 33 foll.
 Greatest p. caused by 'incisive' argument (q.v.), 182^b 32.
- Petito principii* may be due to answerer's fault, 161^b 11-17. 5 modes of, 162^b 34-163^a 13; 166^b 25; 167^a 36-9: rules for its solution, Soph. El, ch 27, why deceptive, 169^b 13-17: a form of *ign. elenchi*, 168^b 22-6.)(begging contrary views, 163^a 24-8.
- Phaedrus*, the, 140^b 4 n.
- Philosopheme* def., 162^a 15
- Philosophy*)(dialectic [see *Dialectical Reasoning*]. Standards of philosophy)(of law or convention, 173^a 29-30. Natural ability necessary for ph, 163^b 12-16 (and see s.v.).
- Phlegm*, not well def. = the 'undigested moisture that comes first off food', 140^b 7.
- Physic*, the, 160^b 8 n.
- Piraeus*, 177^b 13.
- Place* (τόπος), one of categories, 103^b 23, 115^b 12, 146^b 20, 30 n. Difference of p not a specific difference, 144^b 32. Definition should mention essential determinations of p, 146^b 30
- Plane* (ἐπιπέδον): def. = 'limit of a solid' not strictly scientific, but may be inevitable for unscientific man, 141^b 15-25. Posterior to, and ∴ less intelligible absolutely than, 'line', 141^b 5-7, but prior to, and ∴ more intelligible absolutely than, 'solid', 141^b 10-11. 'Finite line' def = 'limit of finite plane', 148^b 28-9.
- Plato*: (a) *philosopher*: 122^b 26 (def. of 'locomotion' = 'carriage', Theaet. 181 d), 140^a 3, 140^b 4 (Phaedr. 245 e); 142^b 1 n. (Def. 411 a); 146^a 22 n. (Hippias Mai. 297 e, 299 c); 148^a 15; 166^a 14 n. (Euthyd. 300 b-c); 173^a 8 (Gorgias 482 e); 179^a 35 n. (Euthyd. 298 e).
 (b) *comedian*: 140^a 3 n.
- Pleasure*: ambiguous, 106^a 37-^b 1 (p. of knowing has no contrary pain: contr. p. of drinking, contrary of pain of thirst, 106^a 37). 'Is p. desirable?' a good dialectical problem, 104^b 7. P. and 'good' or 'the good' (see *Good*). Not a kind of motion (κίνησις), 121^a 30-7. treated as 'activity' (ἐνέργεια), 146^b 16-19. Makes a good thing yet better, 117^a 23: sometimes objectionable, 119^b 6, 10; sometimes beneficial, 119^b 7. Prodicus' division of p. (1) 'joy' (χαρά), (2) 'delight' (τέρψις), (3) 'good cheer' (εὐφροσύνη), 112^b 22. Virtue better than p., 118^b 32-3. Incontinence concerned with certain p only, 146^b 26-7.
 'The pleasant' = 'productive of pleasure', 124^a 16-17; hence (if p be good) a species of the 'useful' (ὠφέλιμον), 124^a 17-20. One of the ends which makes things desirable, 118^b 27-8 (though strictly 'pleasure', rather than 'the pleasant', is the end, 146^b 10-12): whether itself a kind of good, depends on whether what is not good can be pleasant, 124^b 8-14.
- Point* (στίγμα, σημεῖον), def = 'limit of line' (not strictly scientific, but sometimes inevitable in dealing with unscientific men), 141^b 15 foll. Prior to, and ∴ more intelligible 'absolutely' than, 'line', 141^b 5-7: but less readily perceived, and ∴ sometimes less intelligible 'to us', than 'line', 141^b 9-12.
- Poste*, E, edition of Soph. El, 171^b 16 n
- Preliminary admission* (προδιομολογία) sometimes to be secured, 108^b 14, 110^a 32, 119^b 35, 148^b 7-8.
- Premiss*s (see also *Propositions*): how to put and arrange, Bk. VIII (esp. chh. 1-2). 'Necessary p.', def., 155^b 20: how to employ, 155^b 29-156^a 3; may be secured by either deduction or induction, 155^b 35. 'P. other than necessary', their fourfold purpose, 155^b 21-5: how recognized, 160^a 35-9. Should p. more difficult to argue than proposed concludn be asked or granted? v. 159^a 4 foll. False p. admissible in dialectic, 161^a 27-33,

INDEX

162^a 8-11, ^b 18-22 their concln. either true or false, 162^b 12-15 False concln requires false p, 162^b 13-14 but use of wholly or mostly false p, if irretrievably barren of any concln, stands first among 'faults of argument in itself', 161^b 19-24. Argument with false p (whatever its concln) 4th among types of fallacious argument, 162^b 11-15 False and childish p make even argument with true concln. worse than many with false conclns, 162^b 22-4 Reasoning employs few p., 156^a 28-9 Superfluous p., a fault in reasoning held for inquiry, 162^a 24-34, but recommended as dodge for concealment, 157^a 1, though a controversial trick only, 155^b 26. Degree of conviction attaching to p, compared with that attaching to concln., 162^a 19-24

Present (δωρεν) def. = 'a grant that need not be returned', 125^a 18.

Prior terms, more intelligible 'absolutely' than posterior 141^b 5, though sometimes less so 'to us', 141^b 9. Genus should be p. to differentia, differentia to species, 144^b 10-11 Definition, to be scientific, should be of posterior through p. terms, 141^a 26-31, ^b 15-16, though sometimes inevitably vice versa in dealing with unscientific people, 141^b 17 foll Sources of failure to define through p. terms are defn of X (1) through X's opposite, 142^a 22 foll, (2) through X itself 142^a 34 foll, (3) through X's co-ordinate-in-a-division (ἀντιδιηρημένον), 142^b 7 foll, (4) through a species or instance of X, 142^b 11 foll A is better than B if inherent in p. subject, 116^b 17. What is at rest (μενον, ἐν ἡρεσίᾳ) and definite (ἀπρισμένον) is p to what is indefinite (ἀπριστόν) and changing (ἐν κινήσει), 142^a 20-1

Problems = propositions (q v), 101 14-16, but differ in turn of phrase, 101^b 28 foll. Universal

p)(particular p, 108^b 37. 2 kinds of error in, (1) falsity, (2) unconventional vocabulary, 109^a 27-33.

Dialectical p. def, 104^b 1; illustrated, 104^b 7-17. Some subjects disqualified, 105^a 3-9, cf 160^b 17-22. Some harder to handle than others, and less amenable to generally accepted premisses, 161^b 34 foll. D p. and thesis, 104^b 29-105^a 2 (cf.

Thesis)

Produs, his triple division of pleasures (v. *Pleasure*), 112^b 22

Propriety def = an attribute peculiar to, and convertible with, S, but not essential, 101^b 19-23, 102^a 18-19 (cf 28-30), 103^b 11-12, 109^b 10. S and its p. the 'same', though less strictly so than S and its definition, 103^a 27-9, must be different terms, though convertible, 135^a 9-19. Tests for p. applied to Definition, 102^b 27-9, 120^b 13, cf 154^b 13-14, 18-23 (see *Definition*), to Accident, 133^a 32-4 seldom studied separately, 120^b 14. Different kinds of p. (1) *Essential* p, 128^b 16-18. def, 128^b 34-6, (2) *relative* p, 102^a 26-8, ^b 24-6, 128^b 18-19, def, 128^b 36-9: gives rise to either 2 or 4 problems, 128^b 22-33, 129^a 18-20. 2 kinds of r p, according as difference is present (a) universally and always, or (b) usually and in most cases, 129^a 6-16. amenable to tests for Accident, 129^a 32-4, (3) *permanent* p, 128^b 19-20 def. 128^b 39-129^a 2, (4) *temporary* p., 102^a 24-6, ^b 24-6, 128^b 20-1: def., 129^a 3-5 P. of present time (ἰν), 131^b 5 foll. P. of particular individual (τιν) 128^b 20, 131^b 12, 17. Accident may become temporary or relative p, but never a p absolutely, v *Accident*. Different ways in which p may belong:—(1) naturally (normally), as opp. permanently, 134^a 5, 29, ^b 5-7 (2) actually (τὸ ὑπαρχόν), 134^a 50, ^b 7-10: (3) specifically (εἰδέν),

INDEX

134^a 31, ^b 22-135^a 5: (4) absolutely, 134^a 32, 135^a 2, 137^b 28-138^a 3: (5) derivatively (*κατ' ἄλλο*), 134^a 32, ^b 10-13: (6) primarily (*ὡς πρῶτον αὐτὰ*) 134^a 33, ^b 10-13: (7) conditionally on being in a certain state (*τῷ ἔχειν*), 134^a 34, ^b 13-18: (8) conditionally on being the state in which something else is (*τῷ ἔχουσθαι*), 134^a 36, ^b 13-16: (9) because S is *genus of a certain species* (*τῷ μετέχουσθαι*), 134^b 1, ^b 18-22: (10) because S is *species of a certain genus* (*τῷ μετέχουσθαι*), 134^b 4, ^b 18-22: (11) potentially (*δυνάμει*), 138^b 27-139^a 8. Most arguable (*λογικῇ*) p. are the essential (129^a 17, 21-6), permanent (129^a 18, 26-8), and relative (129^a 18-21). Tests for essential and permanent p., Bk. V. (a) Are they rendered correctly? (chh. 2-3); (b) Are they properties at all? (chh. 4 foll.). P. must render S more intelligible, 129^b 2 foll., esp. 7-9, 131^a 12 foll.: must be unambiguous, 129^b 30-130^a 14; likewise its S, 130^a 15-28: must not contain redundancies, 130^a 29-^b 10, or universal attributes, 130^b 11-22: must be rendered singly, 130^b 23-37; and not circularly, 130^b 38-131^a 11: must be a permanent attribute, 131^a 27-^b 4, unless stated to be temporary, 131^b 5-18; not evidenced by perception alone, 131^b 19-36; not essential, 131^b 37-132^a 9 (not definition), 132^b 35-133^a 11 (not differentia), 133^a 18-23 (not definition or differential); though should be prefaced by indication of essence (genus) 132^a 10-21: must be convertible, 132^a 7, ^b 8-18, 135^a 18; cf. 154^b 18-23: must be true universally of S, 132^a 27-^b 3, 154^b 19-22; and of whatever is same as S, as such, 133^a 24-34: must not be rendered in superlative, 139^a 9-20 (cf. 134^b 22 foll.): is usually rendered in complex phrase (*ἐν συμπλοκῇ*), 154^b 15-16, (*ἐκ πολλῶν*) 155^a 24. Sophistical difficulties arising from (a) problem

whether S qualified by some accident is same as S, 133^b 15-36; (b) different ways in which p. may belong, 134^a 5, 18, 26-135^a 5: to meet them, manner in which p. belongs must be stated fully, 135^a 6-8. P. of wholes of similar parts (*ὁμοιουμερῇ*) must apply to both parts and whole (*συνολοῦ*), 135^a 20-^b 6; of contraries, must be contrary, 135^b 8-16; of relatives, must be relative, 135^b 17-26; of terms opp. as state and privation, must be so opposed, 135^b 27-136^a 4; of contradictories, must be contradictory, 136^a 14-27; of co-ordinates-in-division must be co-ordinates in divn., 136^b 3-14; of S, must be true of 'idea of S' not *qua* 'idea' but *quæ* S, 137^b 3-13; of S that is variable in degree, must vary directly with it, 137^b 14-27.

P. more easily disproved than proved, 154^b 13-23: of predicables other than definition, p. the easiest to disprove, hardest to prove, 155^a 23-7.

Propositions (see also *Premises*): the material of reasoning, 101^b 15: = problems, 101^b 14-16, but different in turn of phrase, 101^b 28 foll. 4 kinds of p. dist. by predicable involved, 101^b 17, 23: proof of this, inductive (103^b 2-6) or deductive (103^b 6-19): no single system of tests applies to all, 102^b 35. P. always predicate an attribute in one of 10 categories, 103^b 23. 3 kinds of p, dist. by subject-matter, viz. those dealing with ethics (*ἠθικαὶ*), nat. philosophy (*φυσικαὶ*), and logic (*λογικαὶ*), 105^b 19 foll.: classification rough (105^b 19) and its branches not easily defined (^b 25). Makes a single statement about a single thing, 169^a 8.

Dialectical p. def., 104^a 8, and varieties illustrated, Bk. I. 10 *passim*, and 14 *init.* (see *Op. nion*): = 'one to which answer is "Yes" or "No"', 158^a 15-17, 160^a 33-4, (cf. 175^b 8-10, 176^a 11, 15): = 'one supported

INDEX

- by a no. of instances with no apparent neg instance', 157^b 32-3: cf. 155^a 3-6. Philosophy regards truth of p, dialectic their general acceptance, 105^b 30: cf. 155^b 7-16. P. to be secured in most general form and then subdivided as far as possible, 105^b 31: cf. 109^b 13 foll., 164^a 3, 118. Discovery of suitable p., a main means of dialectic, 105^a 21-3, 164^b 2-4. Stock of p. should be learnt by heart, 163^b 28; to be obtained by practice in deduction with expert reasoners, 164^a 13-14. Putting of p.)(objecting, 164^b 4-7. Arrangement of p (see *Arrangement*).
- Prosyllogism*, in proof of premisses, a means of concealment, 156^a 7.
- Protagoras*, 173^b 19.
- Prudence* (φρόνησις): more desirable in old age, 117^a 28, thin power, 118^a 18: the form of knowledge most generally agreed to be good, 119^b 33-4. Thought by some to be both a moral virtue and = knowledge, 121^b 31; thought by others not to be knowledge, 121^b 32-3. Fourfold disproof that, of virtues, p. alone is knowledge, 120^a 27-31. P. as knowledge of the noble and of the base, 137^a 12 foll. What tends to bring happiness, preferable to what tends to bring p, 116^b 24-6. Choice of prudent man, the norm of what is desirable, 116^a 14; of the 'natural' use of anything, 145^a 25-7.
- Pseudo-Alexander*, 183^a 12 n.
- Punishment* some doubts deserve p., 105^a 4-7. To cause pain and repentance may be p. enough, 156^a 39.
- Quality*, a category, 103^b 22, 26, 38, 179^a 9: essence of a term may be a q., 103^b 27-8, 31-3. Tests for comparative values generalized as comparative tests of any q., Bk. III, ch. 5. Genus of a q. must be a q, 121^a 7-8. Differentia indicates a q., 128^a 26-8 (cf. 122^b 16-17), 144^a 18-22. Definition should mention essential determinations of q., 146^b 20-2, 30. 'White', a q., not essence, of 'snow', 120^b 27-9; so 'good', of 'virtue' (144^a 17-18), of 'soul' or 'man' (107^a 7-8). Verbal terminations proper to q.)(those proper to quantity or to activity, a source of fallacy of 'form of expression', 166^b 13, 16-8.
- Quantity*, a category, 103^b 22, 26, 38, 178^a 8, 179^a 9: essence of a term may be a q, 103^b 33-5. Definition should mention essential determinations of q., 146^b 20-2, 30. 'Good' (of q.) = the 'proper amount' (μέτρον), 107^a 10-11. For variations of q., see *Greater and less Degrees*, *Superlative*.
- Reason* (νοῦς) in soul, analogous to 'sight' in eye, 108^a 11: man 'capable of acquiring r.', 112^a 18-9.
- Reason, faculty of* (τὸ λογιστικόν): the seat of 'shame' (αἰσχύνη) 126^a 8: of 'wishing', 126^a 13: of 'ignorance', 147^b 29-33. Its property (1) to 'command' ('relative' property, of kind occurring 'usually and in most cases'), 129^a 10-16: (2) to show 'wisdom' (τὸ φρόνιμον); belongs to it, 'primarily' (ὡς τὸ πρῶτον), 134^a 33-4: cf. 138^b 2-4, 145^a 30-2, and cf. 136^b 11. *Not* its property actually to 'reason', 138^a 33-6. Belongs primarily to 'soul', 138^b 12-15.
- Reasoning* (syllogism), def, 100^a 25: divided, 100^a 27 foll.: the division rough, 101^a 19. Always employs few premisses, 158^a 28-9: requires universal premisses, 164^a 10-11; turns on def. of familiar and primary ideas, 163^b 20-2. Genuine)(apparent, 164^b 25 foll. R. *per aculem* cannot be refutation, 168^b 4-5, though amateurs often entrap scientists by it, 168^b 6-10. R.)(rhetoric, 167^b 13 (contr 8): backwardness of earlier theory

INDEX

of r. (contr. Rhetoric), 184^a 8-^b 2. Dialectician dist. from amateur examiner in knowing theory of r., 172^a 34-6.

[See *Demonstration, Didactic argument, Contentious r., Dialectical r., Hypothetical r., Fallacy, Misreasoning.*]

'R.' = *deductive r.* (as opp. inductive), 103^b 7, 105^a 11, 153^a 8, 23, 155^b 35, 164^a 13: more forcible and effective, 105^a 18: more suited agst. experts, 105^a 18, 157^a 18, 164^a 13-14 (advised, with view to laying up store of premisses).

Recollection, considered as genus of 'learning', 124^a 22. Knowledge not = r., 111^b 26-31. (Cf. *Memory*).

Reductio ad absurdum, 162^b 20 n.: and see *Impossible*.

Redundancy, 139^b 15 and Bk. VI, ch. 3. Sources of, 140^a 24 foll. (1) universal predicates, 140^a 24-32: (2) words not required to express essence, 140^a 33-^b 15: (3) words that render defn. too narrow, 140^b 16-26: (4) vain repetition of word already used or implied, 140^b 27-141^a 14, 141^a 15-22. [See *Babbling*.]

Refutation: genuine)(apparent or sophistical r., 164^b 25 foll. 2 kinds of sophistical r., (1) only apparently valid, (2) valid but only apparently appropriate, 169^b 20-3. One of principal aims of contentious reasoning, 165^b 14. Sophistical r. never absolute, but always relative to some one, 170^a 12-13, viz. answerer, 170^a 17. R. def. (1) = 'reasoning involving contradictory of given conclusion', 165^a 3; or (more simply) = 'proof of contradictory of given thesis', 170^b 1, 171^a 5: cf. 174^b 35-6, 177^a 16-17; (2) 167^a 23-7: cf. 181^a 1-5, ^b 20-2. Defn. of r. follows closely on that of 'reasoning', except that conclusion is described as the 'contradiction' of some view, 168^a 35-6. All demonstration is also r., 170^a 24-6: every one

engaged in r., 172^a 34. R. *dependent on diction* of 6 kinds, 165^b 24-7; proof of this, 27-30; such r. sometimes due to lack of clearness in question, 169^b 35-6; but same lack of clearness often obscures r., 175^a 41-^b 14, ^b 28-30. Not all r. dependent on ambiguity, 177^b 7-9 (cf. 179^b 38-180^a 7); only 'ambiguity', 'amphiboly', and 'form of expression', 168^a 23-5. R. *not dependent on diction* of 7 kinds, 166^b 21-7. Reasoning *per accidens* cannot be r., 168^b 4-5. R. (true or false) infinite in no.; complete study of r. demands omniscience, 170^a 20-34. Study of r. employing principles of particular science belongs to experts in that science, 170^a 36-8. Dialectic studies only r. resting on common principles, not peculiar to any particular science, 170^a 38-9: this includes r. which are (1) really dialectical, (2) only apparently dialectical, (3) suited to examination, 170^b 8-11. Dialectic studies sophistical r., 172^b 5-8: cf. 108^a 26-31 (but contr. 108^a 33-7).

Relation, a category, 103^b 22. *Essential r.* (πρὸς τὴν καθ' αὐτὴν) opp. *generic r.* (πρὸς τὴν κατὰ τὸ γένος), 124^b 23, 146^a 36: opp. *accidental r.* (πρὸς τὴν κατὰ συμβεβηκ.), 143^a 3-4. Refutation must prove contradictory true in same r. intended in original thesis, 167^a 26, 170^a 7, 180^a 28-30, ^b 7 foll., 181^a 1-4.

Relative terms: essence of term may be a relation, 142^a 28-30, 146^b 3-4 (cf. 103^b 27-9): such essentially r. t. (πρὸς τὴν καθ' αὐτὴν) must be def. through its correlate, 142^a 30-1; being meaningless in abstraction, 181^b 26-8. Genus of r. t. must be r., 121^a 3-4, 124^b 16-17: but this questionable (e.g. 'virtue' a r. t., but 'good' not so), 124^b 19-22; and not true vice versa (e.g. 'knowledge' a r. t., not so 'grammar'), 124^b 18-19: r. t. and its genus should be r. to equal no. of things, 125^a 14-23; though perh. not always, 125^a 23-4.

INDEX

- Differentia** of r. t. must specify correlate, 145^a 13-18. R. t. should be def. in all its relations, 142^b 30-5, esp. in that which is best (143^a 9-11: cf. 146^b 11, 149^b 37), natural (145^a 19-27), and primary (145^a 28-32): but not in accidental relations, 142^b 35-143^a 8, 149^b 4-6, 12-23. [For def. of r. t. see also Bk. VI, ch. 8 (146^a 36-147^a 11), 147^a 23-31.]
- Test** for statements about r. t., 111^a 6-7 (v. 110^b 33-111^a 6). Knowledge of r. t. the same, 105^b 34, 109^b 18, 164^a 1-2. R. t. (absolute standard of 'good' or 'desirable', 116^a 21-2, 118-10: r. t. (absolute use of expression, 166^b 23, 37-167^a 20, and Soph. El., ch. 25. Sophistic refutation always r. to answer, 170^a 12-13, 17-8. R. t. give occasion for 'babbling', 173^b 1-5: for fallacy of 'form of expression', if mistaken for substances, 178^a 4-8, 36-^b 1, 179^a 8-9.
- R. t. as tests of Accident, 114^a 13-25, 119^a 37, 119^b 3-4: of Genus, 124^b 15-125^b 14, 147^a 23-8; of Differentia, 145^a 13-32, 146^a 21-32; of Property, 135^b 17-26; of Definition (see reff. above).
- Rhetoric**: like dialectic, (1) aims at doing best in circs., 101^b 5-10; (2) examines inconsistencies of statement, 174^b 19 foll.)(reasoning (syllogism), 167^b 8 (contr. 13). History of r. compared with that of dialectic, 183^b 26 foll. Rule of r., to cast enthymemes into universal form, 164^a 5: in r., argument from 'signs' (analogy) = argument from consequences, 167^b 8.
- Rhetorician**, def. of, criticized, 149^b 26-9.
- Rob-son** ('Απολλωνιδης), 182^b 20.
- Ross, W. D.**, conj., 137^b 10 n.
- Sameness** (ταὶτόν): ambiguous, 103^a 7, 25-9: and not easy to divide, 169^a 24-5. 3 kinds of s., 103^a 7, (1) numerical, def. 103^a 9, (2) specific, def. 103^a 10, (3) generic, def. 103^a 13. Of these, numerical s. its most generally agreed sense 103^a 23: but even this ambiguous; 3 shades of meaning distinguished, 103^a 25-39. Tests of numerical sameness, Bk. VII, ch. 1. Water from same well, same specifically, 103^a 14. Questions of definition mostly concerned with s., 102^a 7: disproof of s. disproves defn., but proof of s. does not prove one, 102^a 11-17, Bk. VII, ch. 2. Study of 'differences' useful for arguments about s., 108^a 38-^b 4. Sophistical difficulties in fixing properties, owing to ambiguity of 's.' and 'difference' (e.g. is 'A' the same as 'A qualified by an accident', or as its accident?), 133^b 15 foll.: cf. 178^b 39-179^a 1. Arguments about A from what is 'same' as A, in fixing properties, 133^a 24; accidents, 133^a 32. Failure to distinguish s.)(difference, a source of fallacy of Accident, 169^b 3-6.
- Sameness of relations** between 2 things (A and B) and an attribute (a), as test of Property, 137^a 8-20.
- Science** (see also *Knowledge*). Principles of s. should be self-evident, 100^b 19-21; and *prius* of all else, 101^a 39. Use of dialectic in ref. to principles of s., 101^a 36-^b 4. Fallacies based on principles of special s., 101^a 5-17, 170^a 31-4 (see *Mis-reasoning, Refutation*). Special s. of anything the judge of its 'natural' use, 145^a 25-7. No special s. definable as the 's. of reality', 149^b 6-23. S. possibly infinite in no., 170^a 22. One s. 'better' than another if (1) concerned with better object, or (2) more accurate, 157^a 9. That 'the s. of many things is one', ambiguous, 110^b 16. Speculative)(practical s., 152^b 4 (and cf. 149^a 9-13, 14, 17): speculative)(practical)(productive s., 145^a 15, 157^a 10. Philosophical s., 101^a 34. S. of definition (ὁριστική) a speculative s., 141^a 8.

INDEX

Exx. of sciences : (1) *Arithmetic* (ἀριθμητική), also called a 'study' (μῆθησις), 153^a 10; (2) *Geometry*, 101^a 7, 132^a 31 foll., 170^a 28 30, also called a 'study' (μῆθησις), 153^a 10; an 'art' (τέχνη), 104^a 34-6 (cf. 15), 170^a 31, 171^b 12-13, 172^a 1: cf. 'art and faculty', 170^a 36; (3) *Medicine*, 101^b 6-10, 110^b 18, 141^a 19, 149^b 6, 19, 163^a 10, 170^a 29-30: also called a 'faculty' (δύναμις), 101^b 6; an 'art', 104^a 34-6, 170^a 31; (4) *Grammar*, 111^a 37, 124^b 19, 126^a 5, 19; (5) *Musical*, 111^a 37, 128^a 31-2; (6) *Rhetoric*, 101^b 6-10: also called a 'faculty' (ib.); an 'art', 104^a 34-6 (cf. 15) [N.H. no apparent distinction observed between 'science', 'art', 'faculty' and 'study']

Scientist:—his property to be 'incontrovertible by argument'—belongs by reason of state he is in (ὡς τῷ ἔχειν), whereas to 'science' it belongs because it is the state of the s. (τῷ ἔχεισθαι), 134^a 34-^b 1, 15-18. [This the solution of the objection (133^b 28-31) that it belongs to both, and ∴ is property of neither] Not his property 'not to be deceived by argument', 132^a 31-4.

Sea: not its property to be 'the largest vol. of salt water' (true of whole sea, but not of particular seas), 135^a 28-32. *Calm*: sea = windlessness. air, 108^a 11-12, ^b 25-6.

Sensation, Sentience (αἴσθησις): a kind of 'state' (ἔξις), 125^b 17: its privation 'absence of s.' (ἀναίσθησία), 114^a 11. Not a 'capacity', 119^b 2: not genus of 'knowledge', 125^a 28-32: not = knowledge, because irrecoverable if lost, 105^a 28-30; problem, how different, demands study, 108^a 4. Problem 'Is s. knowledge?' a 'definitory' problem, 102^a 5-7. S: object of s. = knowledge: object of knowledge, 108^a 9. Not def. = 'movement through the body', 125^b 16. 'Be sentient', or 'have sense' (αἰσθάνεσθαι) and

'want sense' (ἀναίσθητον εἶναι) doubly ambiguous, (1) have sense)((active use of sense, 129^b 33-4; (2) spiritual sense)((bodily sense, 106^b 23-8. 'Seeing' (ὄρασις) a species of s., 114^a 19, 124^a 38, ^b 6. To be a s., not a property of hearing, 135^b 31-3. Sleep not a 'failure of s.', 145^b 1-4, 14-16. S. as a property of 'animal' (see *Animal*). *Object of s.*, assumed to be knowable, 114^a 21; but often denied to be so, 114^a 23; better known (1) to mass of men, and sometimes to us, than more abstract objects, 141^b 9-12, 156^a 6-7; (2) at first, but objects of thought later, 142^a 2-4. Objects of same kind apprehended by same s., 106^a 29-30: 'white' (clear) in colour and in sound, or 'sharp' (dull) in flavours and in edges, apprehended by different s., 106^a 30-3. Facts evidenced by s. not to be trusted as permanent, 131^b 19 foll. 'Ideas' must be objects of s., if they exist in us, 113^a 27-32.

Shame (αἰσχύνη) resides in faculty of reason, 126^a 8; not a kind of fear, 126^a 6.

Shamelessness (ἀνοιδεῖα) not def. = 'product of courage and false opinion', 150^b 3-6.

Sharp (ὀξύς), opp. (1) to 'flat' (βωρύ), of sounds: (2) to 'dull' (ἀμβλύ), of edges, 106^a 13, 32, 107^a 13, ^b 23. Applied to flavours, 106^a 32, 107^b 14: to an angle (acute), 107^a 16.

Sicily, 177^b 13.

Sight (ὄψις), a species of sensation, 114^a 19 (ὄρασις), 124^a 38, ^b 6: the state (ἔξις) of which 'blindness' is privation, 109^b 22, 147^b 34 (see *Blindness*). S.: eye = reason (νοῦς): soul, 108^a 11. ((hearing, 106^a 32. A property of it, 'to see, inasmuch as we have s.', 136^a 1-2. To 'see' (ὄραν), not a property of 'man', 138^b 9: 'Seeing' (βλέπειν) ambiguous, (1) to possess s., (2) to use s. actively, 106^b 15-20. (So too 'failure to see'—τὸ μὴ βλέπειν.)

INDEX

- Colours in bodies dist. by their reaction on s., 107^b 29-30. 'Beauty' not def. = 'pleasure that comes through s. or hearing', 146^a 22 foll.
- Silver*)(litharge and tin, 164^b 22-4.
- Sleep* not def. = 'failure of sensation', 145^b 1-4, 14-16 not a property of man, 102^a 22-4, 28-30.
- Snow*, not = 'frozen water', 127^a 14; nor is 'water' its genus at all, 127^a 15. 'White' its accident, not its genus, 120^b 22-35, 127^b 2-4.
- Snub-nose* 173^b 10, 181^b 38 foll.
- Socrates*, 103^a 30, 160^b 27-8, 166^b 34, 183^b 7.
- Solecism* def., 165^b 20-1: a principal aim of contentious reasoners to produce, 165^b 14: methods employed, *Soph. El.* ch. 14 how avoided, *Soph. El.* ch. 32 sometimes turns on failure of question to be explicit, 169^b 35 7. S. real)(apparent, 173^b 17 foll. S. compared to fallacy of 'form of expression', 174^a 5-9
- Solid* (1) = *σρεπιδόν*. posterior to, and, ∴ absolutely less intelligible than, 'plane', 141^b 5-7. more readily perceived than either 'plane' or 'line', and . sometimes more intelligible *to us*, 141^b 9-11. 'Plane' def. = 'limit of a s.', 141^b 22.
- (2) = *δγκος*: 'sharp' has diff. meaning of a s. and of a sound, 106^a 13-14, 107^b 23: of a s. and of a flavour, 106^a 32.
- Solution* (*λύσις*) def. (1) 160^b 23-39; (2) 176^b 29-30, 179^b 23-4 S. of refutations appears in analysis of their forms, being merely the appropriate objection, 170^b 4-5, 175^a 17-20: expounded in detail, *Soph. El.*, chh. 16-32. Suggestions for s. of arguments leading (1) into fallacy, 162^b 24-30, 176^b 36-177^a 6; (2) into paradox, 172^b 19-21, 33-4: cf. 176^a 25-7. S. of properly reasoned arguments)(s. of merely apparent arguments, 176^b 35-6 S. of fallacies dependent on diction follows opposite of point on which fallacy turns, 179^a 11 foll. Merely apparent s. should be advanced in default of 'proper' (*ὑποθήκη*) s., 176^a 19 foll. (cf. 179^a). Study of s. useful (1) for philosophy, 175^a 5-12, (2) for reputation as arguer, 175^a 13-16
- Sophism*, 162^a 14: def. 162^a 16.
- Sophist* def. = 'one who makes money from apparent but unreal wisdom', 165^a 22-3, 171^b 28-9; not def. = 'one who can' (deceive), 126^a 31-2. Doctrine of s. that all that is either has come to be or is eternal, 104^b 25-6.
- Sophistical*)(contentious argument [q v.] distinguished by motives of arguers, 171^b 25-34 S. difficulties in fixing properties, arising from ambiguity of 'same' and 'different', 133^b 15 foll. Arguments seem s. if not proved step by step, 158^a 34-6. Apparent but irrelevant proof always s., 162^a 12-15. Bryson's method of squaring circle sophistical, because not based on appropriate premisses, 171^b 16-18. Most s. of all tricks of questioner, to state conclusion as proved when unproved, 174^b 8-11. 'S turn' of argument on to more favourable ground, *Bk. II*, ch. 5, 111^b 32 foll., 172^b 19, 25-8: not so easy as formerly, because answerers are sharper, 172^b 20: where neither really nor apparently necessary, to be avoided, as alien to spirit of dialectic, 112^a 9-11 (cf. *Verbal Argument*).
- Sophistry* def. = (1) 'the art of making money from an apparent wisdom', 171^b 27-9, (2) 'the semblance of wisdom without the reality', 165^a 21, 171^b 34. Akin to dialectic and the art of examination, 183^b 2.
- Soul* def. = 'self-mover' (Plato), 140^b 3: but not a 'self-moving number', 140^b 2: nor a 'number' at all, 120^b 3-6; 123^a 13-14, 23-6. 'Self-moved' not its genus but rather its accident, 120^b 22-8, 32-5. nor 'moved', for possibly not in motion, 123^a

INDEX

- 15-17, cf 127^b 15-17 'motion' inapplicable to *s*, for none of its species will apply, 111^b 5 Not def = 'substance capable of receiving knowledge' (for capable of ignorance too), 151^b 1 May, but need not, possess self-knowledge, 125^a 39 40, 13-4 Its property (1) to be 'fitted to command' the body—relative property, 128^b 18-19 (2) to 'show wisdom'—belongs derivatively (*κατ' ἄλλο*), because *s* possesses faculty of reason, 134^a 32 (3) to be the 'primary whole of which faculties of desire and of reason form part 138^b 12-15 Better and more important than body, 118^a 32-3 virtue and vice of *s*)(of body, 153^b 8-10 Its immortality 119^b 36-7 To 'have a *s*' not correctly rendered as property of 'living creature' (*ζωον*) unless genus ('substance') be also stated, 132^a 15-16, though correct in avoidance of universal predicates, 130^b 20-2 To 'have tripartite soul', an essential property of 'man', 133^a 30 2
- Spartans*, 152^a 14, 15, 17, 20, 22 176^b 5
- Species* See *Genus*
- Speusippus*, 174^b 27 n
- Spider* (*φιδυγγον*), not to be described in defn as 'poison-fanged' (unfamiliar term), 140^a 4
- Spirited* faculty (1) = *θυμοειδές*, seat of anger, but not of friendship and not of hatred, 113^a 35 foll, 126^a 10, seat of fear 126^a 8 (2) *θυμικόν*, 129^a 12
- Squaring the circle*, method of Hippocrates, 171^b 15, by lunules, 171^b 15, 172^a 3, of Bryson, 171^b 16, 172^a 4, of Antiphon, 172^a 7
- State* (1) = *ἔχειν*, one of the categories, 103^b 23 (2) = *ἔστιν S*)('activity', 125^b 15)(the 'capacity' that attends it, 125^b 20)(what is in, or is described in terms of, the *s* —a property may belong in either way, 134^a 34-^b 1, 13-18 a *s* and what is in the *s* have same properties, 133^b 25-8 Genus of 'virtue' and of 'knowledge', 121^b 38 (cf *Disposition*) knowledge a *s* of the soul, 124^b 34 A *s* necessarily found in that whose *s* it is, 125^a 33-7 Tests for definition of a *s*, 147^a 12-22 'The good' not a '*s* of virtue', 142^b 12 Justice not a '*s* that produces equality or 'distributes what is equal', 143^a 15-16 'Virtue' not = 'a good *s*', 144^a 9-10
- S* and *privation* as tests of ambiguity, 106^b 21-8, of Accident, 114^a 7-12, 119^a 37, 11-3, of Genus, 124^a 35-^b 6, of Property 135^b 27-136^a 4, of Definition 147^b 4-17, 26-148^a 9
- Stache*, edition, 132^a 36 n, 166^b 25 n
- Stichon*, *th* less good than health, 116^b 18, than justice, 116^b 38
- Strigil*, not def = an 'instrument for dipping water' (not its natural use), 145^a 23-5
- Students* (*ηκροαμενοι*) as opp other hearers of Aristotle, 184^b 6
- Substance*, a category, 103^b 22 foll Tendency to treat every predicate as a *s* a special source of fallacy of 'form of expression', 168^a 25-6, 169^a 33-6, 170^a 15, and *Soph* Γ1, ch 22, esp 178^a 5-^b, 136-179^a 10 Predicates in categ of *s* (e g 'man'), like other general predicates,)(individual *s*, 178^b 37 foll 'Individuality' and 'being' usually ascribed in fullest sense to *s*, 169^a 35 6
- Sun* not def = 'star that appears by day' (virtually circular), 142^b 1 Not its property to be 'the brightest star that moves over the earth' (known by perception only, and not knowable as permanent), 131^b 25-30
- Superlative*, attribute rendered in (*καθ' ὑπερβολήν*, 134^b 24 *ὑπερβολή*, 139^a 9 *μαλίστα οντιούν*, 152^a 5) cannot be a property. 139^a 9-20 (cf 134^b 22 foll) of A and B, if each an individual, implies their numerical sameness, 152^a 5-12, if not, implies that one contains the other 152^a 12-30.

INDEX

Surface (ἐπιφάνεια) Its property, to be 'the primary thing that is coloured', 131^b 33-6, 134^b 10-13: belongs primarily (ὡς το πρῶτον), 134^b 10-13 - solution of objection (134^b 22-5) that it belongs to 'body' also, and 'cannot be property of either Contr 138^a 15-19, 'being coloured' not a property of s, and whether so or not, cannot be property of 'body' (Same solution would, however, apply.)

Syllogism. See *Reasoning* Syllogistic (reasoned) argument) contentious argument, 187^b 34-6 Most incisive form of s argument, 182^b 37 foll ; of contentious do., 183^a 7.

Synonym, Synonymous terms Must have same definition, 107^b 4-5, 148^a 24-5, ^b 3. Genus and species must be s., 123^a 28-9, 127^b 6, cf. 154^a 18 Syllable cannot be s with one of the letters in it, 150^b 20-1. S not a definition, 149^a 1-4; though 'definitory', 102^a 5. Refutation must prove contradictory of actual attribute asserted, not of its s., 167^a 24. Exx., 'doublet' = 'cloak', 103^a 10, 27, 166^a 30 'beautiful' = 'becoming', 102^a 6, 135^a 13.

Temperance: not def. = a 'harmony' (συνφωνία), because (1) metaphorical, 123^a 34-7, 139^b 33: (2) a harmony always found between notes, not so 'virtue', ∴ 'harmony' and 'virtue' not in subaltern relation, 139^b 37-140^a 2 More desirable in youth than in old age, 117^a 32, than courage, 117^a 36. A property of t. to be essentially the natural virtue of the faculty of desire, 136^b 10-14; likewise of faculty of desire to be primary seat of t., 138^b 4. 'Justice' not def. = 't. and courage', 150^a 3 foll.

Terence, 166^a 37 n.

Theaetetus, the, 122^b 26 n.

Themistocles, 176^a 1.

Theodorus, 183^b 32.

Thesis (1) acc. to strict defn, 104^b 19, 34, 172^b 22, 30: e.g. para-

doxes of Antisthenes, Heraclitus and Melissus, 104^b 20-2 Every t, in this sense, a 'problem', not viceversa, 104^b 29-34 Such t to be collected among other 'premisses', 172^b 31-2.

(2) in wider sense = 'dialectical problem' generally, 104^b 34-6, or (more strictly) the answerer's 'position' on the problem, 111^b 36 (= το κείμενον, 112^a 1), 112^a 4, 7, 13, 113^a 19, 120^a 27, Bk VIII *passim*, 158^b 24 (clearly = πρόβλημα, 158^b 16), 159^a 3, 39 and foll (= το κείμενον, 159^b 24), 160^b 14, 183^a 24, ^b 6 Some t not suited for dialectic discussion, 105^a 3. the clearer in expression, the easier to argue upon, 111^a 10-11 Every t bound to be 'generally accepted' (ἐνδοξος) or 'rejected' (ἄδοξος) or 'neutral' (μηδευτερος), 159^a 38 rules for defending each, 159^b 4-35 2 kinds of 'generally rejected' t, 160^b 16-22 Rules for selecting and maintaining a t, Bk. VIII, ch 9 Aim of questioner always to prove opposite of answerer's t, 159^b 5-6 Parallel arguments to be drawn up *pro* and *con* same t, 163^b 4-5

Thief def = 'one who wishes to pilfer in secret', not 'one who pilfers in secret' (true only of expert t), 149^b 27-30 The 'argument of the t', 180^b 18.

Thrasymachus, 183^b 32

Time (1) = ποτέ, a category: 101^b 23 'Good' in this category = what is 'in season' (ἐν καιρῷ), 107^a 8.

(2) = χρόνος: neither in motion nor a form of motion, 120^a 39-^b 3. Discrepancies of t. (past, present, and future) as tests of Accident, 111^b 24-31, cf. 115^b 12, 17-21: of Genus and Differentia, 123^a 16-19; of Property, 131^a 27-^b 4, ^b 5 foll, 133^a 12 foll. Refutation must prove contradictory true at time to which thesis refers, 167^a 26-7, 180^b 7-8, 11-12, 14, 181^a 1-4 (cf 165^b 38-166^a 6, ^b 23, 180^b

INDEX

- 13-14) Objection directed by answerer agst t allowed for discussion, 161^a 9-12, 183^a 22: questions likewise directed by questioner, where t. is too short to overthrow answerer's solution, 183^a 24 T. or season (καιρός), as determinant of values of things, 117^a 26-37. Temporary property (see *Property*)· requires ref. to present t. only, 129^a 28: property of present t. (ἐν ἰδίῳ), 131^b 5 foll
- Tisias*, 183^b 31-2
- Trainer* (γυμναστής): his property, to 'have ability to produce vigour', 137^a 5-6. T.: ability to produce vigour = doctor: ability to produce health, 137^a 3-5.
- Training* (γυμνασιον) = (1) *physical*· desired as means, 116^a 30-1.
- (2) *in dialectics* Study of Dialectics useful for, 101^a 26 some proofs too elaborate to be suitable for t, 105^a 9 Arguments held for 't and examination')(contentious arguments, and teaching, 159^a 25, cf 161^a 25. [Apparently 't' = 'inquiry' (σκέψις)· cf 159^a 25 and 34] Hints upon t. in dialectics, Bk. VIII, ch 14, *passim* To argue *pro* and *con* everything is good t. for both questioning and answering, 163^a 36-^b 3.
- Triangle* to have angles = 2 right angles, essential to t, but accidental to 'equilateral t', 110^b 22-5, cf. 110^b 6-7· accidental also to 'figure', 168^a 40-^b 4.
- Triballi*, 115^b 23, 26
- Unit* (μονάς). prior to 'number', 141^b 8: starting-point of 'number', 108^b 26, 29, 141^b 8; and more intelligible absolutely than 'number', 141^b 5-8.
- Unity* (τὸ ἓν) ambiguous, and difficult to divide, 169^a 24, 170^b 21-2; though opinions differ about this, 152^b 24-7 Not a 'kind' of anything, because a universal predicate, 121^a 16-19, ^b 7: cf. 127^a 27, 33, 130^b 15-17.
- Commensurate with 'Being', and ∴ neither its genus nor a species of it, 121^b 7-8. Failure to distinguish one)(many, a source of fallacy of Accident, 169^b 3-4.
- Universal predicates* (ὁ πᾶσιν ὑπαρχει· κοινόν), e.g. 'Being', 'Unity'. Not to be used where distinctive terms are required, e.g. in rendering a property, 130^b 11 foll.; or definition, 140^a 24-32.
- Unjustly* (see also *Injustice*). Not a property of what is done u. to be done 'badly' (κακῶς), 136^b 27-8 what occurs u may be preferable to what occurs justly, 180^b 21-3
- Useful* (ὠφέλιμον): def. = 'productive of good', 124^a 16-17, 147^a 34, 153^b 38: possibly the genus of 'pleasant' (if pleasure be a good), 124^a 17-20. Cause of good essentially (καθ' αὐτό) better than cause of good 'accidentally', 116^b 1. What is u. for greater no of desirable ends, is more desirable, 118^b 26-30: also what is u. for better end, 118^b 32-3. Most u of commonplace rules, Bk VII, ch 4.
- Uses* (χρησεις) of a thing, as tests of comparative values, 118^a 34; of genus, 124^a 31-3.
- Using* (χρησις) considered as a kind of 'activity' (ἐνεργεῖν) 124^a 33.
- Verbal argument* (τὸ πρὸς τοῦ νομα διαλεγέσθαι)· to be avoided in Dialectic, 108^a 33, cf. 104^b 36-7, and 112^a 9, 164^b 8 (see '*Sophistic turn*' of argument): but legitimate to stick at nothing with opponent who sticks at nothing, 134^a 1-4, cf. 148^a 21. In Soph. El., distinction of arguments directed at verbal expression—λογισι πρὸς τοῦ νομα)(directed against thought (πρὸς τὴν διανοίαν)—riddled with criticism (ch 10): but argument conducted verbally (διὰ τῶν ὀργανῶν) the commonest source of fallacy, 165^a 4 foll.

INDEX

- Refutation by fallacy of many questions only verbal, 181^b 20-1.
- Vice* 'contrary of 'virtue', 113^b 31-2. the cause of evil essentially, 116^b 6. Genus of 'injustice', 123^b 15, 21, 32, an attribute of 'cowardice', 113^b 31-2. V. of soul (= injustice) opp. to v. of body, 153^b 8-10.
- Vigorous* (ἐβελικόν): = (1) what produces vigour, 114^a 30-1, 153^b 37: (2) what preserves vigour, 114^a 30-1, cf 106^b 35 (3) what betokens vigour, cf 105^a 30 and 106^b 35 (Analogy seems to hold completely 'vigorous: vigour = healthy, health'.) The v, good as means, 106^a 5-8.
- Vigour* (ἐβελία): contrary of 'debility' (καχεξία), 113^b 35, 157^b 18-20. brings 'health', 113^b 35, 157^b 23-4: better than health, 157^b 18-19. Genuine and sham v, 164^a 26-7. Capacity to produce v, the property of a trainer (γυμναστής), 137^a 5-6.
- Virtue* (1) = ἀρετή. a relative term (unlike its genera, 'good' and 'noble'), 124^b 20-2. contrary of 'vice', 113^b 31-2. What displays its proper v more desirable than anything of same kind which does not so, 118^a 27-8. V. of soul (justice) opp. to v. of body, 153^b 8-10. (2) = moral virtue (ἡθικὴ ἀρετή): a kind of 'state and disposition', 121^b 38; a kind of 'good', 142^b 14, 17, and ∴ not def. = a 'good or noble state', 144^a 9-11 (but cf. 11-19). A 'state of v.' not = 'the good', 142^b 12. Cause of good essentially, and ∴ better than luck, 116^b 1-3: better than pleasure, 118^b 33. Its properties (1) to be 'naturally situated in a no. of faculties' (contr knowledge)—a *relative* property, 128^b 38-9. (2) to be 'anything that makes its possessor good', 131^b 1-4. Genus of 'justice', 121^b 26, 123^b 15, 21, 32, 127^b 20, not an accident of it, 109^a 35-
 b 1: genus of 'temperance', 139^b 39-140^a 2: attribute of 'courage', 113^b 31. A different genus from 'knowledge', 152^b 1-2. that of virtues prudence alone is knowledge can be disproved in 4 ways, 120^a 28-31. Problem, whether life of v. or of self-indulgence is pleasanter, a problem about Accident, 102^b 17-20. To be virtuous (τὸ σπουδαῖον) not a property of 'man', 137^b 32.
- Wants* (edition), 132^a 36 n, 155^b 30 n, 157^a 21 n, 158^a 11 n.
- Wallies*, II, 116^b 2-3 n.
- Walling* (1) = βαδισίς, a species of 'locomotion' (φύρα), which is species of 'motion', 122^a 21-30. a kind of motion, 109^b 2-4, 128^a 32-3. (2) 'carriage' (φύρα), 122^b 32. (2) = πεζοί: differentia of 'animal' (v. *Animal*).
- Water* not genus of 'snow', 127^a 14, of 'wine', 127^a 18. W. from same well, the 'same' specifically, 103^a 14-23.
- Wealth*, less desirable than friendship, 116^b 38, because (1) always prized for sake of something else, not for itself, 117^a 1, (2) excess of friendship more desirable than of w, 118^b 6. Happiness unquestionably better than w, 116^a 6-7. To make money less good than to study philosophy, but more desirable to a man lacking life's necessities, 118^a 10. Is w good, if not good to a fool? 180^b 9-14.
- Weighiness* (δύκος) in argument, one of the aims of non-necessary premisses, 155^b 22 (Seems = 'ornament': cf. 155^b 22 and 157^a 6 foll.)
- White* an accidental predicate, 102^b 8-9; a quality, 103^b 31-3; applicable in certain respect only, 109^a 21-5, 167^a 7 foll, 168^b 12-14. 'Colour' its genus, not an accident, 109^a 36, 123^b 26, 126^a 4-5. Def = 'a colour which pierces the vision', 119^a 30, 153^a 38 (cf. 107^b 29-30, 123^a 2): not def. = 'colour mingled

INDEX

- with fire' (an impossible mixture), 149^a 38^b 2. Contrary of 'black', 105^b 36, 119^a 27-8; all other colours intermediate, 123^b 27. Applied to 'sound' (= 'clear'), 106^a 25, ^b 5: cf 107^a 12, 37, ^b 14, 36 (Cf. *Black*). Cannot be a genus, since white things do not differ in kind, 127^a 22-5: not genus of 'snow', since (1) an accident of it, 120^b 21-4, (2) inherent in snow, not predicable of it, 127^b 2-4. Not in subaltern relation to 'beautiful', 128^a 3-4. Addition of w. to black does not necessarily make the whole w, 115^b 1-2.
- Wind*. its definition = 'movement of air' better than = 'air in motion', 127^a 4, but should specify quantity of air, 146^b 29.
- Windlessness* air = calm. sea, 108^a 11-12, ^b 24-6.
- Wine* not = 'fermented water', 127^a 18; nor any kind of water; ib.
- Sweet-toothed man* (φιλογλυκύς) desires wine only *per accidens*, because sweet; not if dry (ἀσθηρός), 111^a 3-5.
- Wisdom* (α) = σοφία: not def. = 'what produces happiness', 149^b 33 foll. (See also *Sophistry*).
- (δ) = φρόνησις, 136^b 11, 163^b 9, cf. 134^a 33, 138^b 1-5: not def. = (1) 'that which defines and contemplates reality' (redundant), 141^a 7-9: (2) the 'virtue of a man' or 'of the soul' (not primary correlate), 145^a 28-32. To be 'essentially the natural virtue of the faculty of reason', a property of w, 136^b 10-12: even its definition, 145^a 28-32. To display w., a property of the faculty of reason (q.v.). W. = 'knowledge of evils', but not therefore an evil, 180^a 8 foll.
- Wishing* (βουλῆσις): def. = 'conation for an apparent good', 146^b 5-6, 27-147^a 5: not def. = 'painless conation', 146^b 2. always found in faculty of reason, 126^a 13: not the genus of 'friendship', if latter is in faculty of desire, 126^a 12-13.
- Xenocrates* 112^a 37: his definition of 'soul' as 'self-moving number', 140^b 2 n. (cf. 120^b 3-4 n.); of 'wisdom' as that which 'defines and contemplates reality', 141^a 6-9: his attempt to prove that the good life = the happy life, because both are the most desirable life, 152^a 7-10, 26-30.
- Zeno*. argument that motion is impossible, 160^b 8, 172^a 9, 179^b 20 foll; that Being is one, 182^b 26.
- Zeus*, 166^b 7.
